IMPACT/DISCUSSION: Myxedema coma is an extreme form of hypothyroidism and presents as a life threatening decompensated state presenting most commonly with hypothermia and altered mental status. This case illustrates the importance of early recognition and treatment of myxedema coma, as presentation can sometimes be atypical and clinical manifestations are not restricted to one organ system.

CONCLUSION: Pericardial effusion is relatively rare in the early mild state of hypothyroidism and as prevalent as 80% when myxedema coma is present. Delay in treatment can be life threatening and it has a high mortality rate of 30-50%.

PERICARDITIS AS A MANIFESTATION OF GRANULOMATOSIS WITH POLYANGIITIS

Neeharika R. Ralh; Sourabh Sourabh; Tanaz Salimnia; Daymon Peterson; Shubhkarmen Dhillon. Wayne State University, Rochester Hills, MI. (Control ID #3185241)

LEARNING OBJECTIVE #1: Granulomatosis with polyangiitis (GPA), formerly known as Wegner's granulomatosis, is an uncommon ANCA-associated vasculitis which is typically known for its sinus, lung and renal involvement. Previously believed to be rare, cardiac manifestations may not be so uncommon. Pericarditis, arteritis, myocarditis, valvulitis and arrhythmias have all been previously recognized in this subset of patients.

CASE: A 48-year-old male with a PMH of GPA with renal involvement presents with acute onset sharp, mid-chest pain associated with positional changes. Workup was significant for diffusely low voltage EKG, elevated troponins in the setting of ESRD with otherwise unremarkable chemistry profile. Echocardiogram and computed tomography of the chest were significant for a moderate to large sized pericardial effusion, 3cm in thickness. Hemodynamic instability concerning for cardiac tamponade prompted emergent pericardial window. Pericardial fluid analysis was unremarkable, no exudates, abnormal histology or malignancy noted. Pericardial tissue revealed fibrinous inflammatory changes. Serum ANCA titers were 1:1280. Treatment with high-dose methylprednisolone and mycophenolate were initiated with immediate relief of symptoms. Patient was diagnosed with pericardial effusion and pericarditis secondary to Wegner's granulomatosis.

IMPACT/DISCUSSION: Cardiac involvement of GPA may occur in up to 6-25% of patients and up to 44% in those with known renal involvement. Pericarditis and coronary vasculitis are the most frequent manifestations in up to 50% of cases.

CONCLUSION: GPA should be considered high on the differential for those with positive history of GPA who present with nonspecific cardiac findings. Complications such as constrictive pericarditis are not uncommon, thus prompt diagnosis and treatment are necessary.

PERIPHERAL NEUROPATHY: DON'T ANCA ON THE DIAGNOSIS

Staci Saunders; Rahul Gore; Terrance Rodrigues; Elizabeth Targan. Beth Israel Deaconess Medical Center, Jamaica Plain, MA. (Control ID #3178458)

LEARNING OBJECTIVE #1: Recognize systemic vasculitis as a cause of peripheral neuropathy

LEARNING OBJECTIVE #2: Recognize treatment options for severe GPA

CASE: A 66 year-old woman presents with three weeks of acute onset bilateral lower extremity pain and foot weakness; two weeks of dyspnea, non-productive cough, epistaxis; and one week of oliguria and lower

extremity edema. Past medical history includes COPD, prior heavy tobacco use, and pre-diabetes. Medications and allergies are noncontributory. Her father is deceased from "kidney failure." Physical exam notable for diffuse rhonchi and crackles, 1+ bilateral lower extremity edema, 3/5 left dorsiflexion, 4/5 right dorsiflexion, and decreased sensation of bilateral feet. Labs notable for Hgb 7.0 (11.2-15.7), K 5.9 (3.5-5.4), HCO₃ 13 (22-32), BUN 89 (6-20), and Cr 8.2 (0.4-1.1). Hepatitis C, HIV, ANA, dsDNA, and anti-GBM are negative. Urinalysis shows proteinuria, hematuria, and granular casts. CT chest reveals multifocal pneumonia. The patient is urgently intubated and initiated on dialysis. Bronchoscopy reveals diffuse alveolar hemorrhage ("DAH"). ANCA antibody returns positive with high titers of PR3 antibody, concerning for granulomatosis with polyangiitis. The patient is initiated on methylprednisolone, cyclophosphamide, and plasmapheresis.

IMPACT/DISCUSSION: Granulomatosis with polyangiitis ("GPA") is an autoimmune disease with granulomatous inflammation of the respiratory tract as well as ANCA-associated necrotizing vasculitis of small-medium sized blood vessels of the lungs and kidneys. This is a case of GPA first presenting with peripheral neuropathy and later evolving to glomerulonephritis and DAH. Peripheral nervous system involvement, such as mononeuritis multiplex, occurs in 15-25% of GPA patients due to arteritis of the vasa nervorum leading to ischemic neuropathy. As such, patients develop asymmetric and abrupt onset peripheral neuropathy, most commonly of the fibular or tibial nerves. Polyneuropathy is more likely to develop in men, the elderly, or those with renal involvement, large disease burden, or high ANCA titers. Initial treatment of GPA consists of glucocorticoids and either cyclophosphamide or rituximab, as two-year mortality of untreated GPA is ~90%. Both cyclophosphamide and rituximab are highly efficacious in treating GPA. Plasmapheresis is controversial but often favored in those with glomerulonephritis, DAH, or those with concurrent anti-GBM. Given our patient's fulminant clinical course, she received high dose corticosteroids, cyclophosphamide, and five sessions of plasmapheresis.

CONCLUSION: This case demonstrates the importance of recognizing GPA as a systemic disease that can present as peripheral neuropathy, a chief concern often encountered in the primary care setting. Given the potentially devastating consequences of untreated GPA, this should be on the differential for acute onset neuropathy. Initial treatment consists of glucocorticoids and either cyclophosphamide or rituximab; with consideration of plasmapheresis in patients with severe features.

PERSISTENT FATIGUE AS THE SOLE SYMPTOM OF A POTENTIALLY FATAL DISEASE

Nicholas David¹; Brian Lewis²; David Feldstein³; Linda Baier⁴; Thomas D. Shiffler³. ¹University of Wisconsin Hospitals and Clinics, Madison, WI; ²University of Wisconsin, Middleton, WI; ³University of Wisconsin School of Medicine and Public Health, Madison, WI; ⁴f Medicine and Public Health, Madison, WI. (Control ID #3184550)

LEARNING OBJECTIVE #1: Recognize the ecology of Rocky Mountain Spotted Fever (RMSF).

LEARNING OBJECTIVE #2: Identify early signs and symptoms of RMSF.

CASE: A 55-year-old man presented to his primary care physician's office in Wisconsin at the end of May with fatigue. He first noticed fatigue a few days ago while driving home to Wisconsin after a recent visit to Maryland, and he needed more coffee than usual to get through the drive. He reported being bitten by two ticks two weeks ago while working outside in Maryland. The ticks were attached for less than 12 hours. He denied fevers, headaches, myalgias, arthralgias, or rashes. There were four small dots of erythema on his left hip where he was bitten, but the physical exam was otherwise unremarkable. CBC, CMP, and serologies for tick-borne illnesses, including Lyme and RMSF, were all normal. He was counseled about preventing tick exposures and instructed to return if more symptoms

developed. The patient's fatigue persisted over the next two weeks. Upon follow up with his PCP, he reported no fevers, and his physical exam was unchanged. Repeat testing returned an RMSF IgG titer of 1:256. He was treated successfully for RMSF with seven days of doxycycline.

IMPACT/DISCUSSION: RMSF is a potentially fatal tick-borne illness. It is classically endemic to the southeastern and southcentral United States, where it is transmitted by the American dog tick. Up to 60% of cases are from five states (NC, OK, AR, TN, and MO), but cases have been reported in all of the lower 48 states except NM. In the northwestern United States, RMSF is spread by the Rocky Mountain wood tick. Although cases have been reported in all months of the year, most occur between May and August. Ticks are both vectors and reservoirs for the disease; thus disease can be transmitted by feeding ticks in all stages of the life cycle. Ticks only need to be attached for 6-10 hours to transmit disease. Most cases become symptomatic 5-7 days after tick exposure, and early symptoms are generally non-specific. They can include fever, headaches, myalgias, and arthralgias. A disseminated rash appears in up to 90% of patients between the third and fifth days of illness. IgG antibody testing, the gold standard of serological diagnosis, turns positive 7-10 days after the onset of symptoms or 12-17 days after the initial tick bite. The above patient presentation demonstrates the importance of understanding the ecology, signs, and symptoms of RMSF in order to make a timely diagnosis. The case has heightened my clinical suspicion for this deadly disease, even though I don't practice in an endemic area. **CONCLUSION:** RMSF is characteristically transmitted by the American dog tick in the Southeastern United States in a matter of hours, but geographical distribution and even tick species are variable. Recognizing a concerning symptomatology in the right ecological context is key to making a timely diagnosis.

PERSISTENT HYPERKALEMIA IN CHRONIC KIDNEY DISEASE DUE TO TYPE IV RENAL TUBULAR ACIDOSIS

Brian Chernak¹; Ryan Bober¹; Alice Tang². ¹NewYork-Presbyterian Weill Cornell Medical Center, New York City, NY; ²Weill Cornell Medical College, New York City, NY. (Control ID #3185758)

LEARNING OBJECTIVE #1: Develop an approach to diagnosis and management of refractory hyperkalemia

LEARNING OBJECTIVE #2: Recognize Type IV Renal Tubular Acidosis as a cause for refractory hyperkalemia in chronic kidney disease

CASE: A 71 year old male with diabetes and chronic kidney disease presented with acute on chronic kidney disease following a mechanical fall. His labs were significant for potassium 6.5 and creatinine 2.94; his baseline creatinine was 1.8. He had a mild metabolic acidosis with a pH 7.32, bicarbonate of 23, and was hyperchloremic to 110. His Hemoglobin A1c was 8.2. The patient received intravenous furosemide, insulin, and sodium polystyrene, with mild improvement of his potassium. Due to persistent hyperkalemia, he received additional furosemide, insulin, and sodium polystyrene, but his potassium continued to increase. Morning cortisol and aldosterone levels were normal, but plasma free renin was low-normal. Urinary potassium excretion was 43.9mmol/L. Due to the high suspicion for Type IV Renal Tubular Acidosis (RTA), fludrocortisone 0.1mg was started with immediate improvement in his potassium from 5.9 to 5.4; it remained within normal levels throughout the remainder of his admission despite minimal change in his creatinine, consistent with a Type IV RTA. He was discharged on fludrocortisone with normal potassium levels.

IMPACT/DISCUSSION: Persistent hyperkalemia is commonly encountered on the general medicine service, especially in patients with chronic kidney disease. Initial evaluation should include assessing for increased potassium intake, pseudohyperkalemia, and medication-related effects. Subsequently, urinary pH, sodium, and potassium can suggest processes which limit potassium excretion, such as type IV RTA, which is characterized by persistent hyperkalemia in the setting of no other identifiable

cause. The cause is typically due to hypoaldosteronism, leading to impaired sodium-potassium exchange in the distal tubule, thereby limiting potassium and proton excretion, causing hyperkalemia and hyperchloremic metabolic acidosis. A recent study has found up to 42% of admitted hyperkalemic patients without ESRD were found to have a Type IV RTA, especially those with underlying renal disease and diabetes. Type IV RTA should be considered in patients with persistent hyperkalemia that is refractory to standard therapies. Low to low-normal plasma renin activity, hyperchloremia, and metabolic acidosis may be suggestive, although lab abnormalities may be minimal. Low urinary potassium excretion can be limited in utility due to a lack of a definitive cutoff value. A mineralocorticoid challenge, which acts in place of aldosterone at receptors in the distal tubule, can facilitate potassium and proton excretion, and identify patients with RTAs.

CONCLUSION: Type IV Renal Tubular Acidosis presents with refractory hyperkalemia but can be difficult to identify in patients with CKD. Diagnosis involves exclusion of other causes of hyperkalemia, lab analysis, and a mineralocorticoid challenge to ensure appropriate diagnosis.

PERSISTENT HYPOGLYCEMIA IN A PATIENT WITH POLYSUBSTANCE USE DISORDER ON HIGH-DOSE METHADONE

Lurit Bepo. University of California, San Francisco, San Francisco, CA. (Control ID #3186265)

LEARNING OBJECTIVE #1: Identify and diagnose etiologies of persistent hypoglycemia

LEARNING OBJECTIVE #2: Manage hypoglycemia due to suspected sulfonylurea overdose

CASE: A 53 year-old male with methamphetamine, benzodiazepine, and opiate use disorders on methadone, ESRD on hemodialysis, and untreated hepatitis C was brought in by ambulance for altered mental status and hypoglycemia to 37 after ingesting an unmarked tablet. Oral glucose, intramuscular glucagon, intravenous dextrose, octreotide, and naloxone were administered with mild improvement in his mental status and persistent hypoglycemia to the 40s. Head imaging, lab work, and infectious studies were unrevealing, and the patient was started on a dextrose infusion and admitted to the inpatient medicine service. Due to ongoing low blood glucoses, the dextrose infusion rate was increased, and he was started on octreotide for empiric treatment of a sulfonylurea overdose. Sulfonylurea panel was negative as was work up of insulinoma with normal insulin, proinsulin, and c-peptide levels. High-resolution mass spectrometry revealed metabolites of methadone, antidepressants, and cigarettes. The patient was dialyzed while inpatient, and his methadone dose was decreased from 100mg to 60mg daily due to concern for methadone-induced hypoglycemia. He continued to have episodes of hypoglycemia after dextrose was discontinued, but the exact etiology was never identified.

IMPACT/DISCUSSION: The sulfonylurea, glipizide, is similar in appearance to diazepam and is often substituted for the benzodiazepine in illicit drug sales. It is hepatically cleared and ingestion of multiple tablets of extended release glipizide would cause approximately 48-60 hours of hypoglycemia; this is irrespective of impaired renal function as was the case with this patient. Mainstays of management of sulfonylurea overdose are dextrose infusion and IV or IM octreotide administration, the latter which blocks pancreatic insulin release. Though the patient was initially suspected to have an accidental sulfonylurea overdose, his persistent hypoglycemia >100 hours after his ingestion raised concerns for alternative etiologies. These included an insulinoma, in which insulin, pro-insulin, and c-peptide levels are notably elevated during episodes of low blood glucose, and methadone-induced hypoglycemia. Previous case reports and observational studies have described glycemic dysregulation with hypoglycemia in the setting of rapid escalation or high

doses of methadone above 40 mg. This patient's case was unusual in that the patient had reportedly been on 100 mg of methadone for 5 years and 90 mg for 10 years prior to that. The patient declined transition to buprenorphine at discharge for management of his opiate use disorder.

CONCLUSION: -Suspect sulfonylurea overdose in patients with a benzodiazepine use disorder who present with persistent hypoglycemia. -Treat suspected sulfonylurea overdose with dextrose infusion and IV or IM octreotide. -High-dose or rapid escalation of methadone can cause hypoglycemia.

PID HIDING IN PLAIN SITE

Kristen Wilson¹; Amy H. Farkas^{1, 2}. ¹Medical College of Wisconsin, Milwaukee, WI; ²Milwaukee VA Medical Center, Milwaukee, WI. (Control ID #3182652)

LEARNING OBJECTIVE #1: Recognize the importance of diagnosing pelvic inflammatory disease (PID)

LEARNING OBJECTIVE #2: Understand how clinical biases can impact clinical reasoning

CASE: A 36-year-old female presented to primary care for abdominal pain following ventral hernia repair performed 4 weeks prior. On initial questioning, she reported achy abdominal pain along with difficulty sitting comfortably. She denied any pain at her incision sites, fever or chills, or associated urinary symptoms. Examination of her abdomen revealed healing incisions without tenderness. During the exam, she commented that the pain was more localized to her pelvis. Review of gynecologic history revealed that the patient had one sexual partner, last intercourse was one week prior to surgery, and she denied vaginal discharge. She did note abnormal spotting. Pregnancy test was negative. A pelvic exam revealed purulent discharge from the cervical os with fundal and adnexal tenderness. Cervical swabs were obtained for chlamydia, gonorrhea, and vaginitis panel. She was treated empirically for PID with ceftriaxone IM, oral doxycycline and metronidazole. On one-week follow-up, patient was clinically improved. Cultures were negative.

IMPACT/DISCUSSION: PID is a clinical diagnosis hallmarked by pelvic organ tenderness and inflammation of the lower genital tract which can lead to significant health outcomes. It is often missed by clinicians. While classic presenting symptoms include abrupt onset of severe lower abdominal pain following menses, increasingly women are presenting with less severe symptoms thought to be secondary to a shift in the microbial etiology involving non-gonococcal or chlamydial species. Up to 50% of women with PID will have no evidence of gonorrhea or chlamydia on laboratory testing. As physicians are performing fewer screening pelvic exams they must remember to have a low threshold for performing the bimanual in a woman with an acute abdominal complaint. Too often, clinical bias results in anchoring and premature closure such as in this case where the provider initial anchored on the women's recent abdominal surgery as a cause of her pain only to discovery a benign abdomen on exam. While there are many categories of bias in clinical reasoning, the lead-in thought pattern that precedes them all is Type 1 processing wherein intuitive diagnoses are favored over those obtained via analytical reasoning. It is important for physicians to be aware of clinical bias in their diagnostic reasoning to prevent premature closure and missed diagnoses.

CONCLUSION: 1. PID is a clinical diagnosis that often has subtle findings 2. PID is associated with other organism beyond gonorrhea or chlamydia 3. Awareness of clinical bias is necessary to reduce barriers to identification of disease References Brunham, R. C., Gottlieb, S. L., & Paavonen, J. (2015). Pelvic inflammatory disease. NEJM, 372(21). Croskerry, P., Mamede, S., & Singhal, G. (2013). Cognitive debiasing 1: origins of bias and theory of debiasing. BMJ Quality & Safety, 22(2): ii58-ii64.

PITFALL OF MYCOPLASMA PNEUMONIAE: PNEUMONIA?ENCEPHALITIS?MENINGITIS!

Ryutaro Nagaya; Yoshihiko Kawano; Takamasa Tanaka; Mitsunori Iwase. Toyota memorial hospital, Toyota-city, Japan. (Control ID #3186269)

LEARNING OBJECTIVE #1: Recognize that *Mycoplasma pneumoniae* may lead the aseptic meningitis.

CASE: The patient was a ten-year-old boy without a past medical history. He presented to our emergency room(ER) with a chief complaint of chest pain and nausea. Before visiting ER, he already visited some clinics three times because of mild fever and cough for 5 days but he was treated as just common cold. Chest X ray showed infiltrative shadow bilaterally. It clinically presumed pneumonia and he was admitted to our hospital. On the 2nd day, loop-mediated isothermal amplification(LAMP) was positive, leading to our diagnosis of Mycoplasma pneumonia. *Mycoplasma pneumoniae*-specific antibody titers was 1:40. Clarithromycin 400mg/day was administrated. He was discharged without any symptoms on the 5th day,. On the 6th day he went to school, but felt fever, headache and nausea. Because these symptoms continued, he visited ER again. He was febrile and neck stiffness was present without disturbance of consciousness. Brudzinski and Kernig signs were positive. Cerebrospinal fluid (CSF) examination showed no pleocytosis, the protein level was 51 mg/dl. Glucose in CSF was normal (55mg/dl) but bacterial meningitis was not ruled out completely. Then cefotaxime and clarithromycin were administrated. On the 9th day, fever sustained and we suspect macrolide-refractory mycoplasma pneumonia and minocycline was administrated. On the 11th day, he responded well and recovered and blood culture test were negative. *Mycoplasma pneumoniae*-specific antibody titers was 1:360. He eventually discharged in good condition on on the 15th day.

IMPACT/DISCUSSION: Impact When patients with pneumonia caused by *Mycoplasma pneumoniae* show neurological manifestations, we should consider that the symptoms are caused by *Mycoplasma pneumoniae*. Discussion Mycoplasma pneumoniae is one of the important causes of upper and lower respiratory tract infections during childhood especially 6 to 14-year-old children. Patients suffering *Mycoplasma pneumoniae* infection may have varying degrees of neurological complications at a ratio of approximately 6 to 7%. Neurological manifestations include encephalitis, transverse myelitis, acute disseminated encephalomyelitis, Guillain-Barre syndrome, thromboembolic stroke and aseptic meningitis. The time period between the onset of respiratory symptoms and neurological symptoms varies 2 to 14 days. More than 80% of patients with CNS findings have concomitant respiratory infection. Actually, in this case, aseptic meningitis was evident 6 days after he had symptoms of respiratory tract. Although aseptic meningitis usually do not need any antibiotics, aseptic meningitis caused by *Mycoplasma pneumoniae* should be administrated some antibiotics clarithromycin and so on.

CONCLUSION: We should consider that *Mycoplasma pneumoniae* cause neurological manifestations including aseptic meningitis after respiratory tract infections.

PLATYPNEA-ORTHODEOXIA SYNDROME: NOT AS SIMPLE AS IT SOUNDS

Harshit Dua; Ali Azim; Nyi Nyi Kyaw; Allan Tachauer. Weiss Memorial Hospital, Chicago, IL. (Control ID #3185400)

LEARNING OBJECTIVE #1: Recognize the clinical features of Platypnea-Orthodeoxia Syndrome (POS).

LEARNING OBJECTIVE #2: Suspect POS in patients with no apparent causes of hypoxia and perform appropriate diagnostic testing to hasten its identification.

CASE: A 77-year-old female presented to the hospital with shortness of breath. She was found to be tachypneic, anxious and requiring 50%

oxygen via ventimask (VM) to maintain saturation of 88%. Chest radiograph was unremarkable, and an arterial blood gas revealed a PaO₂ of 48mmhg on 100% oxygen via VM, therefore she was placed on non-invasive ventilation. A ventilation/perfusion scan of the lungs was found to be unremarkable. Further testing ruled out acute coronary syndrome, heart failure and pneumonia. She had no prior history of any lung disease, smoking or other inhaled illicit substances. Her history of work as a mechanical engineer in Ukraine generated a suspicion of interstitial lung disease, leading to a high resolution CT scan that revealed mild lung base dependent atelectasis. On day 3 of admission, it was coincidentally noticed, after a portable pulse oximeter was left on the patient's finger that, her hypoxia had significantly improved in the supine position. Subsequently, a diagnosis of POS was entertained and a transthoracic echocardiogram (TTE) with bubble study was ordered, which was positive for significant intra-atrial shunting. A trans-esophageal echocardiogram that followed confirmed the size and location of an atrial septal defect. Subsequently she was transferred to the tertiary center for repair, where she underwent successful trans-catheter repair, and was then discharged home in a stable condition as her hypoxia had resolved.

IMPACT/DISCUSSION: This case demonstrates how a rare diagnosis such as POS, which can result in severe hypoxia, can be neglected unless physicians are mindful of it. POS is a condition characterized by dyspnea and hypoxemia in an upright position that resolves when in supine position. The etiology of the condition is believed to a combination of anatomic and functional components. The former includes intracardiac shunting, intrapulmonary shunting, ventilation-perfusion mismatch or a combination of these. Functional components such as cardiac, pulmonary, abdominal and vascular disease further contribute to result in POS. Its pathognomonic finding of orthostatic dyspnea and hypoxia, which improve in the recumbent position, were present in our patient. Diagnosis started with establishment of a relationship between hypoxia and upright position, and further confirmed by echocardiography, although the gold standard for diagnosis remains angiography. The condition is usually only suspected when other causes of hypoxia are ruled out due to its rarity, and in many cases etiology cannot be identified with certainty.

CONCLUSION: The possibility of cure, via an anatomic repair of intracardiac shunt, makes identification of POS crucial. Physician awareness of the disorder, timely diagnosis, and treatment can prevent further morbidity and mortality.

PLOT TWIST IN AN INPATIENT CELLULITIS CASE

Mohamed Diop; William Turner; Kelsey B. Bryant. Columbia University Medical Center, New York, NY. (Control ID #3183357)

LEARNING OBJECTIVE #1: Identify components of a focused physical exam from HPI

LEARNING OBJECTIVE #2: Diagnose AIDS and CNS Opportunistic Infections

CASE: Male, 55, with no known history presented to the emergency department (ED) with 3 weeks of right lower extremity pain (RLE) and swelling. Progressive pain and difficulty ambulating prompted his presentation. He denied history of trauma; fracture and deep vein thrombosis were ruled out in the ED. He was initially febrile and tachycardic (though remarkably well appearing) and was dosed broad-spectrum antibiotics just prior to hand-off to the hospitalist team. Upon our evaluation, the patient verified his initial history and, and as a casual aside, mentioned he had been experiencing subtle numbness on his right side in addition to double vision. He denied any other neurologic symptoms. Family history was noncontributory. Social history notable for home country of Brazil, sexually active with only wife, no drug use, rare alcohol use, and current smoking. His exam was consistent with RLE cellulitis with warm-to-touch-erythema from foot to mid-calf and small punctate areas with purulent drainage. Neurologic exam confirmed sensory deficit over the entire right half of his body. White blood cell count was 6.7. Given

systemic signs of infection and inappropriately normal WBC count, an HIV test was sent. While awaiting results, he underwent brain MRI revealing several patchy lesions with rim enhancement in the left corona radiata concerning for toxoplasmosis, lymphoma, or another infectious vs inflammatory process. Lumbar Puncture puncture was quickly performed. At the same time, we received a preliminary (+) HIV test. CSF returned positive for toxoplasma, and lymphoma was ruled out with both central and peripheral flow cytometry. Confirmatory HIV assay returned (+) and CD4 count resulted at 56 confirming a diagnosis of AIDS complicated by CNS toxoplasmosis and cellulitis.

IMPACT/DISCUSSION: Though unrelated to his chief complaint, a thorough neurologic exam was the turning point in a workup for a life-altering diagnosis. This highlights the importance of a broad differential and systematic approach to physical exam directed by the HPI and, even if the diagnosis seems obvious. Internists are often the first to notice abnormalities leading to specialty involvement, thus maintaining knowledge of things like common CNS lesions is important for workup initiation.

CONCLUSION: This patient did, in fact, have cellulitis, but a systematic approach to the HPI and physical, allowed for the diagnosis of AIDS and an opportunistic infection. Internists should be comfortable with HIV testing and counseling, and familiar with common etiologies of CNS findings to initiate appropriate workup. Throughout this patient's admission, our rapport with him grew. This allowed us to disclose his diagnosis in a way that felt comfortable for him, and assist in his transition to outpatient HIV care which he continues to engage in.

PML-IRIS: SEIZE THE OPPORTUNITY

Julieta Rodriguez; Benison Lau; Deirdre Lewis. Baystate Medical Center, Springfield, MA. (Control ID #3186673)

LEARNING OBJECTIVE #1: Define PML-IRIS

LEARNING OBJECTIVE #2: Management of IRIS in the setting of PML

CASE: A 28-year-old male with perinatal acquired immunodeficiency syndrome (AIDS) prescribed highly active antiretroviral therapy (HAART), complicated by progressive multifocal leukoencephalopathy (PML), recurrent herpes, and Hodgkin's lymphoma in remission presented in status epilepticus. Seizure activity was terminated by levetiracetam and lorazepam soon after onset. Exam was notable for decreased consciousness, asymmetric pupils minimally reactive to light, bradycardia, and asymmetric reflexes with intact muscle tone bilaterally. Labs were remarkable for a normocytic anemia, and a lactate of 3. 4. CT head revealed decreased white matter attenuation, without evidence of mass effect or hemorrhage. He was managed empirically for meningoencephalitis with acyclovir, ceftriaxone, vancomycin, and ampicillin while being monitored on continuous VEEG. Once a full septic workup was negative for an active infection, he was treated with steroids and HAART (CD4 count 22) for a presumed diagnosis of PML- Immune reconstitution inflammatory syndrome (IRIS). Refractory symptoms (continued seizures and unresponsiveness) necessitated initiation of a dexamethasone taper, valproic acid, and mirtazapine with resultant clinical improvement and a repeat CD4 count up to 105.

IMPACT/DISCUSSION: IRIS refers to an acute inflammatory process that occurs due to rapid regeneration of CD4 cells after initiation of HAART therapy in the setting of an ongoing or preexisting infection. It presents with constitutional symptoms which may be consistent with worsening of the existing infective process, including following the treatment for tuberculosis or leprosy. More than 90% of patients were admitted to the hospital at the time of IRIS diagnosis. Supportive care is generally adequate therapy, however steroids may be required to blunt immune response. In the presence of PML, IRIS further lowers the seizure threshold predisposing patients to epileptiform activity as severe as status epilepticus. PML-IRIS onset after HAART treatment can range from 1 week - 26 months with most cases occurring within 4-8 weeks. Up to 1/3rd

of PML infected HIV patients developed IRIS after starting HAART with 1/3rd of those developing IRIS requiring steroid therapy. Thus hospitalists should have a high index of suspicion for IRIS and steroid management. While steroids have become the primary treatment, it is important to note that while steroids attenuate immune response it may allow JCV to replicate and lead to initial worsening of neurologic symptoms.

CONCLUSION: PML-IRIS is a rare condition where worsening neurologic symptoms, including seizures, can occur. Steroids may blunt the immune response but may cause a paradoxical worsening of neurologic symptoms initially.

POINT-OF-CARE ULTRASOUND FOR THE DETECTION OF CLINICALLY SIGNIFICANT ELEVATED INTRACRANIAL PRESSURE IN THE PRIMARY CARE CLINIC.

Kang Zhang; Justin Chen; Greg Heinicke. Internal Medicine Residency Spokane, Spokane, WA. (Control ID #3167221)

LEARNING OBJECTIVE #1: Highlight the usefulness of ocular POCUS for evaluation of elevated intracranial pressure (ICP)

CASE: A 32-year-old female presented to the primary care clinic for management of persistent headaches that has worsened in frequency and severity for the past two-years. The headache etiology was multifactorial attributed to migraines, and suspected obstructive sleep apnea. She previously declined polysomnography study. NSAIDs and acetaminophen provided limited relief. The patient was reluctant to try triptan therapy. Previous neuroimaging excluded secondary causes of headaches. Neurological examination revealed no focal deficits. The patient refused direct fundoscopic examination, though previously documented fundoscopic examination did not reveal papilledema. Ocular POCUS performed in clinic demonstrated an increased optic nerve sheath diameter of (ONSD) 5.7 mm suggestive of elevated ICP. IIH was suspected and lumbar puncture showed an opening pressure measured of 300 mmH₂O. A diagnosis of IIH was made based on the modified Dandy criteria. The patient was started on carbonic anhydrase inhibitor and counselled on weight loss. Her daily symptoms improved significantly with initial medical therapy. At 3-month follow up, the patient was headache free.

IMPACT/DISCUSSION: The implications of ocular POCUS to estimate ICP may have large clinical impact in the outpatient setting where headache is common complaint. It is critical for physicians to determine primary and secondary headaches as it dichotomizes the need for potential neuroimaging. The traditional direct fundoscopic exam is an essential skill in general internal medicine. However, a survey of general internists showed the nondilated fundoscopic examination ranked the lowest in self-confidence rating (2.5 on a 5-point Likert scale) compared to 13 other core physical examination maneuvers. Moreover, self-confidence scores of the nondilated fundoscopic examination declined throughout medical training. Ocular POCUS may be an alternative method for evaluating elevated ICP by measuring the ONSD. In the neurocritical care setting, an ONSD >4.8mm had a sensitivity of 98% and specificity of 94% and area under the curve (AUC) 0.98 when compared to invasive ICP measurement. Similar results are reported in the emergency room literature using an optimal cut-off value of the ONSD >5.00mm. More specifically, in patients proven IIH, the optimal cut-off value for ONSD was 6.3mm had a sensitivity, specificity of 94.7% and 90.9% respectively. A systematic review and meta-analysis of ocular POCUS showed that depending on pre-test probability, an ONSD > 5mm had a positive, negative likelihood ratio of 12.5, and 0.05 respectively.

CONCLUSION: Depending on the pre-test probability, ocular POCUS (ONSD >5mm) may be an accurate surrogate marker for the detection of elevated ICP in patients with headache. This non-invasive point-of-care method can have a large clinical impact in the primary care setting.

POST-BABESIOSIS WARM AUTOIMMUNE HEMOLYTIC ANEMIA IN AN ASPLENIC PATIENT

Muhammad Z. Khan¹; Pragya Shrestha¹; Daniel Forman^{2, 1}. ¹Reading Hospital - Tower Health, Wyomissing, PA; ²Tower Health, Reading, PA. (Control ID #3155361)

LEARNING OBJECTIVE #1: Recognize warm autoimmune hemolytic anemia (WAHA) as a complication of Babesiosis

LEARNING OBJECTIVE #2: Consider screening for WAHA in patients diagnosed with babesia with worsening anemia not responding to anti-parasitic therapy

CASE: An 84-year-old male with history of splenectomy post motor vehicle accident presented with one-month history of fatigue and unintentional weight loss of 20 pounds. He endorsed spending time in woods and cutting trees for the last 10 years. He was afebrile with blood pressure 99/57 mmHg with mild tachypnea. Labs were significant for hemoglobin 7.6 mg/dl, LDH 989 IU/L, total bilirubin 2.9 mg/dl with indirect hyperbilirubinemia. Transaminase and platelets were normal. Blood parasite smear revealed parasitic inclusions morphologically consistent with Babesia. Direct Coombs test was positive with warm autoantibody (IgG). Titers were negative for Lyme antibody, Ehrlichia & Anaplasma. After initiation of azithromycin and atovaquone for babesiosis, blood parasitemia load decreased from 4.8% to 0.2%. However, even with low parasitemia, hemolysis remained persistent with high LDH and further drop in hemoglobin. Immunosuppression was initiated with prednisone 60 mg daily after which a significant improvement in blood counts as well as symptoms was evident.

IMPACT/DISCUSSION: Babesiosis is a tickborne zoonotic disease that is caused by intraerythrocytic protozoa of the genus Babesia with endemic prevalence in the northeastern and midwestern regions of the United States. Presentation can be variable from flu like illness to a life-threatening state with severe anemia. Older age, asplenia, immunodeficient conditions are risk factors for severe disease process. Post-babesiosis warm autoimmune hemolytic anemia (WAHA) can be a detrimental complication of babesiosis especially in asplenic patients.

CONCLUSION: Screening for WAHA should be considered in cases of worsening anemia despite of appropriate treatment for babesiosis. Post-babesiosis WAHA responds to immunosuppressive treatment rather than antiparasitic treatment.

POST-CHOLECYSTECTOMY BLEEDING COMPLICATION

Dung Mac; Farzana Harji. University of New Mexico, Albuquerque, NM. (Control ID #3185648)

LEARNING OBJECTIVE #1: Recognize cystic artery pseudoaneurysm as a post-cholecystectomy bleeding complication.

CASE: 37 year-old male with history of alcoholic cirrhosis with portal hypertension, peri-esophageal and gastric varices, Mallory-Weiss tear s/p clipping, ITP s/p steroids and IVIG therapies, and recent hospitalization for acute cholecystitis s/p laparoscopic cholecystectomy, with subsequent post-op elevated total bilirubin and normal MRCP, re-admitted one week later for spontaneous bacterial peritonitis (sbp), decompensated cirrhosis with new ascites, alcoholic hepatitis, and c. diff colitis. CT showed absent gallbladder with free air in the fossa and no biloma. HIDA scan did not show tracer into the biliary tree. Patient completed sbp treatment, and subsequently placed on prophylaxis antibiotics with worsening of his c. diff colitis and therefore antibiotics were discontinued. 11 days into hospitalization, he acutely decompensated with tachycardia, hypotension and worsening anemia. GI was consulted and EGD and ERCP done emergently did not reveal bleeding source. Over the course of the day, patient's abdomen became more distended. Paracentesis confirmed hemoperitoneum. Arterial phase CT showed arterial bleeding in gallbladder fossa and gastro-hepatic region. Patient was found to have

pseudoaneurysm of the cystic artery which was successfully embolized by IR. However, patient deteriorated again after successful embolization with re-bleeding that was felt to be due to his underlying liver disease, renal dysfunction, and c. diff colitis with possible disseminated intravascular coagulopathy (DIC). He was placed on CRRT and pressor support. He was not a candidate for TIPS or liver transplant, and was transitioned to comfort care per family request and deceased shortly afterward.

IMPACT/DISCUSSION: Uncontrollable bleeding post lap cholecystectomy is a serious complication with low incidence of 0.1-1.9% and usually presents intra or post-surgical with acute hemodynamic decline. Uncontrollable bleeding from lap cholecystectomy usually arise from 3 sites, the liver, arterial sources, or port insertion sites. This case is unique in that patient had acute bleeding from cystic artery 3 weeks post-procedure. A recent review identified pseudoaneurysms (PSAs) of the hepatic and/or cystic artery as a rare complication following a laparoscopic cholecystectomy that can occur several weeks after the procedure. In the cases reviewed, trans-arterial embolization had a 94.5% success rate with a 2.0% mortality.¹ Our patient had poor prognosis due to multiple comorbid conditions including underlying liver disease with portal hypertension, renal dysfunction, and possible DIC with c. diff colitis leading to re-bleeding post embolization.

CONCLUSION: Bleeding from pseudoaneurysms is a rare complication from laparoscopic cholecystectomy that can manifest up to a month post procedure.

POST-PARTUM WOMAN WITH WORSENING DYSPNEA: WHEN YOUR EYES DO NOT SEE WHAT YOUR MIND IS NOT LOOKING FOR.

Alison M. Fernandes¹; Lesly Silva¹; David H. Lindner². ¹NCH Healthcare system, Naples, FL; ²Naples Community Hospital, Naples, FL. (Control ID #3171914)

LEARNING OBJECTIVE #1: To illustrate post-partum dyspnea with an underlying congenital heart defect.

LEARNING OBJECTIVE #2: To characterize a rare disorder in adulthood.

CASE: LS, a 31 y.o (G1P1) without PMH was transferred to the ICU, two days after an uneventful vaginal delivery of a full-term infant, for management of acute hypoxic respiratory failure. She was noted to have a near-syncopal episode associated with hypoxia. Physical exam revealed clear lungs; O2 sat 95% on 3L/min NC. RRR without murmur, and 1-2+ ankle edema. Labs revealed elevated troponins, and D-dimer. Right ventricular hypertrophy on EKG. CT angiogram was negative for pulmonary embolism; however, it alluded to a prominent pulmonary artery 3.86 cm in diameter. TTE showed LVEF 50%, pulmonary artery systolic pressure >120 mmHg, consistent with severe pulmonary hypertension-group I secondary to patent ductus arteriosus (PDA). Over the hospital course, her hypoxic state worsened, requiring intubation. A right heart catheterization demonstrated pressures in the 100-110 range. It was felt with acute occlusion of the PDA that hemodynamic collapse would occur due to her Eisenmenger's physiology. She would require an assist device as a bridge to transplant, and with her significant neurologic deterioration and subsequent cardiopulmonary arrest, she was not felt to be a candidate for a heart-lung transplant. She ultimately succumbed to death two weeks after initial presentation.

IMPACT/DISCUSSION: This case illustrates a previously undiagnosed PDA in a post-partum woman. The incidence of PDA in full term infants (0.02-0.04%) has been rising due to advances in medicine[1]. On average, blood volume increases 50% during 20-32 weeks of gestation resulting in a high cardiac output[4]. To compensate, the systemic and pulmonary vascular resistance decrease. In those with PAH, pulmonary pressure remains high during this period because the resistance in flow across the PA is already elevated[2]. Recognizing the characteristic continuous flow murmur across the PA is crucial in identification of a PDA. However, there are

multiple reports of undiagnosed PDAs in adulthood, as the murmur is seldom detected[1]. Symptomatic PDA's are a common presentation during pregnancy[3]. Kanter et al. reported a 22-week G1P1, who was treated with a transcatheter closure using an Amplatzer ductal occlude device[3]. This device can be used in PDAs up to 12mm in diameter. In the case of our patient, the diameter of her PDA was >3cm, thereby limiting her options for intervention. Maternal mortality rate is >50%, while the fetal mortality rate is ~25%, with associated risk of sudden death at 4-6 weeks post-partum in Eisenmenger syndrome[4]. As of yet, there has been no treatment to alleviate this mortality risk. It is therefore been strongly recommended these women terminate their pregnancy early.

CONCLUSION: It is imperative that there be a higher awareness of this issue in primigravida patients, as early detection in this population can decrease adverse outcomes and support proper family planning.

POSTERIOR PLACOID CHORIORETINITIS AS THE ONLY MANIFESTATION OF NEUROSYPHILIS IN HIV NEGATIVE PATIENT

Mais Abdou¹; Nooraldin Merza¹; Asrar Abdou³; Hussain Alhamza⁴; Kaylee J. Shepherd². ¹TTUHSC, Amarillo, Amarillo, TX; ²Texas Tech University Health Sciences Center, Amarillo, TX; ³St Joseph Mercy Oakland, Troy, MI; ⁴TTUHSC, Amarillo, TX. (Control ID #3184557)

LEARNING OBJECTIVE #1: Recognize the ocular manifestations of systemic diseases. Identify placoid chorioretinitis as an uncommon but distinct ocular manifestation of neurosyphilis.

CASE: A 73 year-old male with medical history of hypertension and bilateral retinal macular degeneration presented to our primary care clinic with worsening blurry vision for about 2 months. There was no headache, weakness, numbness or gait problems. Vitals were stable. Physical exam was unremarkable except for decreased visual acuity bilaterally, which was notably worse when compared to his previous visit. Complete blood counts and basic metabolic panel revealed no significant abnormality. The patient was referred for ophthalmology evaluation. Complete eye exam showed bilateral retinal vasculitis with disseminated choroiditis and posterior placoid chorioretinitis. Syphilis laboratory workup was done and revealed negative RPR but reactive FTA-ABS and TP-PA. Public health database showed a diagnosis of primary syphilis in 1981 that was treated with penicillin. HIV testing was negative. The patient was successfully treated with IV penicillin G for 14 days.

IMPACT/DISCUSSION: Syphilis is a multi-systemic sexually transmitted infection caused by the spirochete *Treponema pallidum*. Since the introduction of penicillin, the incidence of syphilis decreased dramatically. However, it has been increasing back in the past decade secondary to high rates of human immunodeficiency virus (HIV) co-infection. Ocular syphilis can manifest in many different forms with panuveitis being the most common finding. The diagnosis of ocular syphilis based on ophthalmic findings, is often challenging due to lack of pathognomonic findings and serological confirmation is usually needed. Acute syphilitic posterior placoid chorioretinitis is a rare but characteristic ocular manifestation of syphilis. Once it's present, the patient should be tested for a neurosyphilis and HIV, if positive. Early treatment with intravenous penicillin is usually effective with good visual results.

CONCLUSION: Physicians should be aware of the ocular manifestations of systemic diseases and infections like syphilis. Ocular signs of syphilis may be the only clinical feature of systemic disease. Early recognition and treatment with intravenous penicillin is necessary to prevent complications and vision loss.

POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES) AS A COMPLICATION OF RED BLOOD CELL TRANSFUSION

Hayato Mitaka¹; Leslie L. Seijo¹; Kenji Motohashi²; Mori Nakai²; Alfred Burger³. ¹Mount Sinai Beth Israel, New York, NY; ²Nerima Hikarigaoka

Hospital, Tokyo, Japan; ³Mount Sinai Beth Israel, Icahn School of Medicine at Mount Sinai, New York, NY. (Control ID #3185470)

LEARNING OBJECTIVE #1: - Recognize that PRES can develop after RBC transfusion - Recognize that rapid correction of chronic anemia is the risk factor for developing PRES

CASE: A 46-year-old woman with iron deficiency anemia presented with headache, right hand weakness, and "difficulty texting and folding clothes," two weeks after being hospitalized for symptomatic anemia with shortness of breath and hemoglobin of 2.9 g/dL. During her previous admission, she received transfusions of 3 units of red blood cells and was discharged home with a hemoglobin level of 7.5 g/dL. She now presented to the ED with 3-days of constant, non-localized headache and 1-day history of clumsiness and weakness of the right hand. On exam, her BP was 179/78 mmHg, and there was numbness, reduced dexterity and apraxia of her right hand. Routine labs were unremarkable and her hemoglobin was 7.5 g/dL. An MRI of the brain showed multiple subcortical high-intensity lesions on bilateral anterior, parietal, and occipital lobes on T2-FLAIR images. Pregnancy test, hypercoagulable work-up, RF, ANA, and ANCA were negative. The hospital course was complicated by a brief episode of tonic convulsive seizure which self-resolved. Given her neurologic symptoms and radiologic findings, the clinical diagnosis of Posterior Reversible Encephalopathy Syndrome (PRES) secondary to blood transfusion was made. Her headache and neurological symptoms of the right hand gradually improved after starting oral calcium channel blocker. A follow-up MRI 4 weeks after discharge showed resolution of the high-intensity lesions.

IMPACT/DISCUSSION: PRES is a neurologic syndrome characterized by acute onset of headache, altered mental status, seizure, and visual disturbances, with radiographic findings of symmetrical white matter edema in the posterior cerebral hemispheres, particularly in the parieto-occipital regions. Rapid correction of anemia with transfusion is a rare cause of PRES with only 10 cases described in literature as of April 2016, according to Cevallos CA and Berman BS. The pathogenesis of PRES after transfusion remains unclear, but it has been proposed that a rapid rise in the hematocrit results in both increased blood viscosity and a loss of hypoxic vasodilation, leading to disordered cerebral autoregulation and endothelial dysfunction. Most of the cases develop from several days to 2 weeks after transfusion, and more likely to occur when the chronic anemia is rapidly corrected. Moderate hypertension as seen in this patient has been described as a complication of PRES. The prognosis is mostly benign and PRES is fully reversible within days to weeks, after removal of the inciting factor (rapid correction of hematocrit in this case) and blood pressure control with vasodilator if hypertensive.

CONCLUSION: Physicians should have a high index of suspicion for this rare but serious condition if a patient with chronic anemia develops neurological symptoms after RBC transfusion, and should avoid rapid correction of chronic anemia without hemodynamic instability.

POTASSIUM CHLORIDE AS TRIPLE THERAPY

Ammara A. Khan, Creighton University, Omaha, NE. (Control ID #3185798)

LEARNING OBJECTIVE #1: 1. Diagnose acute severe metabolic alkalosis

LEARNING OBJECTIVE #2: Safely treat profound hyponatremia without sodium chloride

CASE: A 48 year old male with a past medical history of chronic pancreatitis, chronic pain and alcoholism presented with a 7 day history of vomiting and diarrhea. At the time of presentation, he was tachycardic with heart rate in 110s and hypotensive with blood pressure 90s/60s. Physical exam was notable for dry mucosal membranes, tremulousness, tangential thought processes and visual hallucinations. His metabolic panel was significant for multiple abnormalities; AKI with a creatinine

of 4, severe hypochloremia with a chloride of 51, severe hyponatremia with a sodium of 118, severe hypokalemia with a potassium of 2.2, metabolic alkalosis with a bicarbonate of 40 and a coexisting high anion gap metabolic acidosis with an anion gap of 29. ABG showed metabolic alkalosis with partial respiratory compensation. His pH was 7.6 with a bicarbonate of 56 and pCO₂ of 58. The patient initially received a liter of lactated ringer's in the ER and his sodium began to overcorrect. His IV fluids were discontinued, and he was placed on a continuous Potassium chloride infusion for the next 24 hours by nephrology. The patient's ketones were metabolized once he received dextrose, and his anion gap began to narrow. With volume repletion and cessation of vomiting, his renal function began to improve as well as his alkalosis. His sodium, as well, appropriately corrected over 48 hours.

IMPACT/DISCUSSION: Our patient developed a pre-renal AKI due to persistent GI losses causing dehydration. Reduced blood flow to the kidneys led to secondary hyperaldosteronism, causing further retention of bicarbonate and excretion of hydrogen, potassium and chloride. Despite the nephron's attempts to retain sodium the increased ADH led to a relative excess of water as compared to sodium leading to a relative hyponatremia. Simultaneously the patient had HAGMA due to lactic acidosis and starvation ketosis. Metabolic alkalosis (MA) is a relatively common, although rarely severe disorder, characterized by elevation in body pH secondary to elevation of plasma bicarbonate. MA is associated with life threatening complications like arrhythmias due to electrolyte disorders and tissue hypoxia from compensatory respiratory acidosis. MA can lead to hypokalemia, hypernatremia and hypocalcemia. Several studies have shown that mortality with MA increases proportionate to the pH: 41% with pH 7.55 to 7.56, 47% with pH 7.57 to 7.59, 65% with pH 7.6 to 7.64, and 80% with pH 7.65 to 7.7. Our patient with a pH of 7.6 had an expected mortality rate of 65%.

CONCLUSION: In the setting of acute kidney injury, metabolic alkalosis can be severe enough to cause life threatening complications. Secondary hyperaldosteronism due to profound GI fluid loss can complicate acute kidney injury. Metabolic alkalosis, profound hypo-osmolar hyponatremia and hypochloremia can be safely treated with potassium chloride.

PREMATURE CLOSURE IN CLINICAL DECISION MAKING : A CLASSIC PRESENTATION OF LYMPHOMA IS AN UNUSUAL CASE OF DABSKA TUMOUR

Hoang-long Huynh²; Christine Chan²; Doris Zavaro¹; Amarpreet S. Bains²; Sheetal Desai-Oghra³; Marwa Moussa¹. ¹NYU Langone, Staten Island, NY; ²NYU Langone Health, Brooklyn, NY; ³NYU, Brooklyn, NY. (Control ID #3183224)

LEARNING OBJECTIVE #1: Avoid premature closure when a patient presents with classic lymphoma symptoms. Our case was given a diagnosis of lymphoma by the emergency department and the hematologist oncologist consulted on the case. While the first impression was lymphoma, there is a very rare, locally invasive neoplasm of the lymphatic vascular origin called papillary intralymphatic angioendothelioma (PILA), also referred to as Dabska tumor. Recognize that although PILA commonly presents as a slowly growing, asymptomatic (without B symptoms), violaceous patch or nodule, arising from a preexisting lymphatic or vascular anomaly that occurs typically in young adults, it may also affect the elderly and present with typical B symptoms.

CASE: A 36 year-old otherwise healthy female presented with six days of acute flu-like symptoms, myalgias, persistent fever and chills associated with abdominal bloating and vomiting for three days. Physical exam was notable for temperature of 103 F, sinus tachycardia and mild tenderness at the left upper quadrant on deep palpation. Labs were notable for a normal WBC count, mildly elevated alkaline phosphatase and total bilirubin. The flu swab was negative. All infectious workup including a quantiferon-TB gold test was negative. The Chest CT showed confluent 9 x 5 cm anterior mediastinal and 2 x 2 cm sub carinal lymphadenopathy extending to the

aortopulmonary window. On abdominal CT abdomen and pelvis there was marked diffuse, bulky and confluent upper abdominal, mesenteric and retroperitoneal adenopathy. The patient underwent mediastinal video assisted thoracoscopic surgery (VATS) which showed papillary intralymphatic angioendothelioma (PILA). The patient was referred to a vascular anomalies' specialist and was prescribed Sirolimus for prophylaxis immunosuppressant therapy.

IMPACT/DISCUSSION: To our knowledge, less than 40 cases of PILA have been described in literature. Presently, there are diagnostic challenges for pathologists and providers given PILA's rarity and histological complexity to distinguish it from other vascular lesions and lymphoma. We present a new and unusual case of PILA with typical B symptoms and multifocal intra-abdominal lesions. Most case reports describe asymptomatic and external presentations. It is important to rely on final pathology prior to assuming lymphoma is the most likely diagnosis.

CONCLUSION: Premature closure is failure to consider alternative diagnoses after the initial impression is formed. This leads to diagnostic errors that can have substantial effects on our patients lives. Rare diseases are often overlooked and we need to recognize PILA as a differential diagnosis for neoplasms of the lymphatic vascular origin.

PRIMARY CARE OF INDIVIDUALS WITH INTELLECTUAL AND DEVELOPMENTAL DISABILITIES—AN OPPORTUNITY FOR EDUCATION AND ADVOCACY

Elizabeth "Betty" Kolod¹; Irene Chern². ¹Montefiore Medical Center, Bronx, NY; ²Albert Einstein College of Medicine, Bronx, NY. (Control ID #3185956)

LEARNING OBJECTIVE #1: Recognize individuals with intellectual and developmental disability as a health disparity population.

LEARNING OBJECTIVE #2: Explore features of high-quality care for individuals with IDD.

CASE: A 45-year-old woman with a history of depression, obesity, and seizure disorder presents for a routine visit with a new primary care provider (PCP). She has a fractured tooth from a violent encounter with her boyfriend and believes she may have recently had a seizure but is unable to provide more detail. She emigrated from Puerto Rico to the Bronx at age 5 and completed the 10th grade in special education; she is on disability due to chronic pain. She lost custody of four of her children due to former cocaine use and now cares for her two remaining children and her mother who is illiterate. Prior notes intermittently refer to "underlying cognitive issues" with no formal neuropsychological evaluation. She declines a home visit to evaluate safety and social support and departs with referrals to Neurology and domestic violence services.

IMPACT/DISCUSSION: Intellectual and developmental disabilities (IDD) comprise lifelong limitations of intellectual, physical or emotional development and adaptation. Health disparities are socially-produced differences in burden of illness experienced on a population level; the CDC defines individuals with disabilities as a health disparity population. CDC researchers note a five-fold increase in rate of diabetes and more than two-fold increase in cardiovascular disease among individuals with IDD compared to the general public. This disparity is compounded in people of color with IDD, particularly Hispanic women. Furthermore, individuals with IDD are 1.5 times more likely to be victims of violence and face twice the rate of sexual assault—in one study 49% of persons with IDD experienced 10 or more sexual assaults. High quality care for patients with IDD requires an understanding of unique health risks and strategies for providing basic preventive care. Patients with IDD are at increased risk for obesity, substance use disorders, seizure disorders, mental illness and violent or sexual victimization. Major barriers to care for patients with IDD include communication challenges, inaccessible office design, and poor physician compensation contributing to lack of access to health professionals trained in IDD. These barriers can be addressed by increasing emphasis on IDD in medical education and

public health research, clinical adaptation to patient capabilities, interprofessional coordination, and including caregivers in communication. By utilizing a patient centered approach, PCPs can increase self-advocacy as well as inform physician advocacy for resources to address the disparities faced by this community.

CONCLUSION: Individuals with intellectual and developmental disabilities have worse health outcomes. PCPs can address this health disparity through advocacy and familiarity with best practices in the care of individuals with IDD.

PRIMARY NEUTROPHILIC DERMATOSIS MISDIAGNOSED AS NECROTIZING PORT SITE INFECTION

Ranish Patel; Shadi Dowlatshahi. Oregon Health and Science University, Portland, OR. (Control ID #3167602)

LEARNING OBJECTIVE #1: Recognize clinical features of neutrophilic dermatoses

LEARNING OBJECTIVE #2: Recognize the significant overlap in clinical presentations of neutrophilic dermatoses and severe infection

CASE: 52-year-old man with myelodysplastic syndrome status post 2 cycles of azacitidine, recent port placement who presented to an outside hospital with painful, erythematous port site. He denied any fevers, chills or sweats. Vitals were notable for tachycardia. Physical exam revealed confluent erythema over the area of the port, extending up to the neck. Labs were significant for WBC $19 \times 10^3/\mu\text{L}$. Vancomycin, clindamycin, and piperacillin-tazobactam were started empirically. Surgery was consulted, and the port was removed with copious pus noted at the port site, alongside gas-forming bubbles in the skin. The patient subsequently underwent debridement of the area, with healthy fascial and muscular tissue seen. However, the lesion was noted to continue to expand beyond the surgical margins into a 16 x 9cm necrotic ulcer with a pink-red indurated, and undermined edges. Follow up blood and wound cultures were all negative for pathologic organisms. The patient was transferred to our hospital for further management. Dermatology was consulted, and biopsy was performed. Histopathology demonstrated marked numbers of neutrophils present extending from the surface into the underlying adipose tissue. A diagnosis of pyoderma gangrenosum versus necrotizing Sweet syndrome was made. Antibiotics were discontinued, and the patient was started on a 2-month course of high-dose prednisone and dapsone. The wound displayed marked improvement and healed by secondary intention.

IMPACT/DISCUSSION: This case illustrates the potential for misdiagnosis of necrotizing skin infection in those with primary neutrophilic dermatosis, particularly in patients with compromised immune function. Common distinguishing features include associations with systemic diseases (i.e. hematologic malignancies, inflammatory bowel disease), and sterile, neutrophilic infiltrate on histopathology. Additionally, while not exhibited in all cases, the phenomenon of pathergy is frequently present. In these cases, skin injury is induced or exacerbated at sites of both incidental or iatrogenic trauma, as was seen with our patient. Appropriate diagnosis and management is therefore critical, as aggressive debridement has the potential to cause significant expansion of primary lesions, which in turn warrant further unnecessary resections resulting in significant morbidity.

CONCLUSION: - It is important to consider primary neutrophilic dermatoses in patients with suspected severe skin infections, particularly in patients who are immunocompromised. - Appropriate and timely diagnosis is critical, as delayed management can often result in significant patient morbidity

PRIMARY RENAL LYMPHOMA PRESENTING AS RENAL CELL CARCINOMA

Joy Tang. Medical College of Wisconsin, Milwaukee, WI. (Control ID #3179282)

LEARNING OBJECTIVE #1: Recognize the increased risk of lymphoma in patients with Crohn's disease and the potential risk with use of TNF-inhibitors.

LEARNING OBJECTIVE #2: Recognize primary renal lymphoma as a differential for a renal mass.

CASE: A 75-year-old male with history of Crohn's disease (CD) on treatment with infliximab for the past 4 years was incidentally found to have an acute kidney injury with creatinine of 2.15 mg/dL. Patient had no complaints. He denied dysuria and hematuria. Vitals and exam were unremarkable. Labs including electrolytes, blood cell counts and urinalysis were unremarkable. A renal ultrasound showed moderate hydronephrosis of the left kidney. CT kidneys then demonstrated a large left retroperitoneal mass measuring 4cm x 2.5cm that was inseparable from the left renal pelvis and enlarged retroperitoneal lymph nodes. Infliximab was stopped due to concern for malignancy. A ureteral stent was placed with improvement in symptoms. Ultrasound of the scrotum was normal. Urine cytology from a diagnostic ureteroscopy was negative for malignancy. Core needle biopsy of the mass then revealed diffuse large B-cell lymphoma. PET scan showed lymphadenopathy above and below the diaphragm. Bone marrow biopsy showed no lymphoma. He established care with hematology/oncology and was started on R-CHOP chemotherapy. He switched treatment to vedolizumab for his CD.

IMPACT/DISCUSSION: Lymphomas are a rare complication of longstanding CD. Most reported cases have occurred in the gastrointestinal tract. Risk factors include advanced age, male gender, use of immunosuppressive therapy, EBV infection and hepatitis C infection. TNF- inhibitors, such as infliximab, are commonly used to treat CD. Recent studies have also reported an increased risk of lymphomas with TNF- inhibitors. The proposed mechanism is by decreasing apoptosis and allowing proliferation of neoplastic cells. Primary renal lymphoma (PRL) is characterized by lymphoma involving the kidney in the absence of primarily extrarenal lymphatic disease. PRL is very rare as the kidney is an extranodal organ and does not have lymphatic tissue. It has a reported incidence of 0.7% of all extranodal lymphomas and is diagnosed in <1% of all kidney lesions. Diagnosis is frequently delayed as it can be difficult to differentiate renal lymphoma from other renal masses. Patients can be asymptomatic, but commonly complain of abdominal or flank pain, weight loss or gross hematuria. The main treatment is chemotherapy using a CHOP regimen, which differs from other renal tumors that may require nephrectomy. It is important for physicians to be aware of PRL and maintain a broad differential in evaluating renal masses as management can change.

CONCLUSION: • Lymphomas are a rare complication of CD. Use of TNF- inhibitors may increase the risk of developing lymphoma. • PRL should be considered when evaluating any renal mass. It can be treated with systemic chemotherapy unlike other renal masses that may require nephrectomy.

PROGRESSIVE RENAL OSTEODYSTROPHY WITH DYSMORPHIC FEATURES (SAGLIKER SYNDROME) ASSOCIATED WITH SUBOPTIMALLY TREATED SECONDARY HYPERPARATHYROIDISM

Naiha Nadeem; Colette Knight. Montefiore Medical Center, Yonkers, NY. (Control ID #3184955)

LEARNING OBJECTIVE #1: Recognize the pathophysiology and treatment of renal osteodystrophy

LEARNING OBJECTIVE #2: Recognize the importance of early intervention in the treatment of secondary hyperparathyroidism (SHPT) to prevent the progression of bone disease

CASE: 40-year-old woman with history of chronic renal disease (unknown etiology) progressing to end-stage renal disease on hemodialysis for seven years and SHPT s/p parathyroidectomy who presented with shortness of breath. She had short stature measuring 150 cm (4' 9") with large head circumference, facial disfigurement with changes in shape of mandible, teeth and palate. Labs revealed parathyroid hormone (PTH) level 1300 pg/mL, serum calcium 8 mg/dL, serum phosphate 4 mg/dL and alkaline phosphatase (ALP) 1200 U/L. Radiographic imaging showed diffuse osseous expansion and sclerosis with focal intraosseous lesions consistent with a combination of severe renal osteodystrophy with superimposed brown tumors. The patient also had severe cervical spinal stenosis and extensive thickening of skull. She was treated with calcitriol, phosphorus binders, and calcimimetics. Her clinical presentation was consistent with Sagliker Syndrome.

IMPACT/DISCUSSION: Sagliker syndrome is a rare form of renal osteodystrophy with disfiguring facial changes, associated with overgrowth of facial bone resulting from untreated SHPT associated with renal failure. The syndrome was first described in 2004 and so far 70 cases have been reported in the literature. Inadequate treatment of SHPT causes phosphorus retention, vitamin D deficiency, alteration in the metabolism of calcium and, increase in PTH and ALP level causing skeletal changes, renal rickets, damage to the points of bone growth in children, and subperiosteal changes. Facial disfigurement is caused by alterations of facial bones and tumor-like soft tissue collections. Patients can also develop psychological problems and depression. Renal transplantation prevents progression of the musculoskeletal changes, but established deformities are not reversible. The exact cause is still unknown but genetic mutations were detected in 40% of patients. Treatment with calcitriol, vitamin D analogues or calcimimetics is recommended in the early stages of SHPT due to CKD to decrease levels of PTH. In refractory cases, complete parathyroidectomy is suggested.

CONCLUSION: Early monitoring and appropriate treatment of patients with renal insufficiency and secondary hyperparathyroidism can prevent irreversible complications including bone and soft tissue abnormalities.

PROGRESSIVE VISION LOSS IN A PATIENT WITH ADVANCED MALIGNANCY

Dame Idossa; Brian A. Costello. Mayo Clinic, Rochester, MN. (Control ID #3139290)

LEARNING OBJECTIVE #1: To highlight paraneoplastic syndromes as cause of vision loss in patients with advanced malignancy

CASE: A 49 year-old, previously healthy gentleman presented with daily progressive headaches, low-grade fevers, progressive fatigue, and abdominal pain. A thorough laboratory evaluation solely demonstrated microcytic anemia. As part of the work up for the anemia, an ultrasound of the spleen was obtained and revealed a shadow on the spleen, prompting further studies. A CT of the abdomen/pelvis revealed a mass on his left kidney with multiple lesions on the liver and extensive retroperitoneal lymphadenopathy, concerning for metastatic disease. He underwent an excisional lymph node biopsy which revealed metastatic papillary renal cell carcinoma with sarcomatoid features. After an evaluation by an oncologist, he ultimately decided not to pursue conventional treatment options. Three months after his initial diagnosis, he presented to his primary care physician with rapidly progressive bilateral loss of vision. Extensive ophthalmologic evaluation revealed melanocyte proliferation of the uvea, diagnostic of bilateral diffuse uveal melanocyte proliferation (BDUMP). This was thought to be a paraneoplastic process arising from his underlying advanced malignancy. He initiated treatment for his visual symptoms with plasmapheresis and IVIG. This transiently improved his vision, but he never regained his baseline visual capabilities. He ultimately developed bilateral retinal detachments and complete vision loss. He continued to defer treatment of his underlying malignancy and developed progression of his underlying metastatic papillary renal cell carcinoma.

IMPACT/DISCUSSION: BDUMP is a rare paraneoplastic ocular syndrome occurring in patients with systemic, often occult, but advanced carcinoma and is the hallmark of poor prognosis. Although rare, BDUMP has consistently resulted in devastating visual consequences. The five cardinal signs of BDUMP described in the literature are: (1) multifocal, faintly visible, round or oval, red, subretinal patches, with (2) associated striking pattern of associated hyperfluorescence during the early phases of angiography; (3) development of multiple, slightly elevated, pigmented and non-pigmented uveal melanocytic tumors, as evidence of diffuse thickening of uveal tract; (4) exudative retinal detachment; and (5) rapid progression of cataract. Ocular symptoms typically precede manifestation of systemic carcinoma by 3-12 months. Thus, an internist would need to have a high index of suspicion, prompt evaluation, and appropriate referral. Treatment options for BDUMP are limited and often unsuccessful. Treatment modalities include: corticosteroids, ocular radiotherapy, plasmapheresis, and treatment of the underlying malignancy.

CONCLUSION: Paraneoplastic syndromes arising from malignancy can present in myriad ways and should always remain on the differential in patient diagnosed with cancer.

PROGRESSIVE VISUAL IMPAIRMENT DUE TO UVEITIS - A RETURN OF SYPHILIS AS THE "GREAT IMITATOR"

Elissa Arnold; Debapria Das; Alexander Barsam; Andrew Jilwan; Kahee Mohammed; Sangeeta Khanna; Stewart Albert. Saint Louis University, St. Louis, MO. (Control ID #3186137)

LEARNING OBJECTIVE #1: Describe the ocular and neurological presentation of *Treponema pallidum* infection.

CASE: A 47 year old woman presented to ophthalmology for evaluation of painless bilateral vision loss, headaches and ataxia of 1 months duration. She was initially seen for symptoms of right sided vision loss with inability to see faces or read. A brain MRI showed foci in periventricular and subcortical white matter consistent with demyelinating disease. A lumbar puncture (LP) revealed lymphocytic pleocytosis with 26 WBC and was negative for NMDA and Aquaporin-4 antibodies. CSF cultures and cytology examinations were negative. She presented at a later date and was found to have vitritis and papillitis in both eyes. Visual Acuity (VA) was 20/70 on right, 20/100 on left. She had a positive Romberg sign, unequal pupils with diminished response to light and normal accommodation. Repeat MRI showed left optic neuritis. Serologies were negative for HIV, bartonella, chlamydia, gonorrhea, and tuberculosis. FTA-Abs was positive and RPR titer was 1:128. The patient was admitted and started on intravenous penicillin. Within 48 hours, VA improved to 20/25 in the right and 20/30 in the left eye and there was resolution of her ataxia and headaches. Further questioning revealed that she had a maculopapular rash involving her palms five months prior which spontaneously resolved. On discharge (day 4) VA was 20/25 bilaterally.

IMPACT/DISCUSSION: Manifestations of syphilis are broad, warranting its nickname: "The Great Imitator." Syphilis has been increasing in incidence with 9.5 cases per 100,000 in 2017. 75-90% of cases are men and there is coinfection with HIV in 50% of cases. Emerging cases of ocular syphilis prompted advisory from the CDC in 2015, recommending LP in patient with known syphilis and neurologic symptoms. Ocular syphilis may occur in secondary or late syphilis. On average, the diagnosis of ocular syphilis is obtained 2.8 months after onset of symptoms. All structures of the eye may be affected, with uveitis being the most common presentation. It is recommended to perform an LP as if there is a concern for ocular syphilis as 1/4 of cases will have findings consistent with neurosyphilis, as seen in our patient. It is more common for HIV negative neurosyphilis to present with cognitive impairment and ataxia, rather than meningitis, stroke, and vision or hearing loss. Treatment is IV Penicillin G, 3-4 MU every 4 hours for 10-14 days.

CONCLUSION: In an era when sophisticated analyses and therapies have emphasized awareness of HIV, we may have become less suspecting of *T. pallidum*. Our patient experienced a delayed diagnosis since her initial brain MRI was suggestive of demyelinating disease. This case demonstrates the versatile presentation of syphilis in an unsuspected demographic, the HIV negative female. The diagnosis should be considered with unexplained neurologic or ocular symptoms, as prompt treatment of this potentially fatal condition generally leads to full recovery and successful outcomes.

PSEUDOMONAS PUTIDA CELLULITIS AND BACTEREMIA IN A PATIENT WITH CHRONIC LYMPHOCYTIC LEUKEMIA

Florina Corpodean²; Crystal Xue²; Ribka Ayana¹. ¹Washington DC VA Medical Center, Washington DC, DC; ²George Washington University Hospital, Washington, DC. (Control ID #3185038)

LEARNING OBJECTIVE #1: Recognize clinical spectrum of *Pseudomonas putida* (*P. putida*) infection

LEARNING OBJECTIVE #2: Recognize pathogenicity of *P. putida*

CASE: A 73-year-old man with untreated chronic lymphocytic leukemia and lymphedema presented with three weeks of progressive left leg swelling, erythema and pain. On admission, he was febrile and hypotensive. He had diffuse circumferential erythema with warmth and tenderness extending to his upper left leg, along with a large flaccid bulla and multiple three-centimeter lesions with purulent drainage on his posterior calf. He also had a prominent

left inguinal lymphadenopathy. Laboratory studies revealed leukocytosis to 25 K/cmm with lymphocytic predominance. Blood cultures were obtained, and he was started on vancomycin and piperacillin/tazobactam. Patient remained hemodynamically stable but was intermittently febrile with worsening leukocytosis over the subsequent days. CT of the extremity was obtained and revealed edema without fluid collection. On day 4 of hospitalization, his blood cultures grew *P. putida* with intermediate sensitivity to piperacillin/tazobactam and meropenem. His antimicrobial regimen was changed to cefepime and metronidazole with good clinical response.

IMPACT/DISCUSSION: As a gram-negative organism frequently found in the environment, *P. putida* was previously thought to be of low pathogenicity. Although *P. putida* bacteremia and skin and soft tissue infections (SSTI) remain uncommon, it is important for clinicians to be aware of the rise in *P. putida*-associated nosocomial infections and potential fatality of these infections particularly in immunocompromised patients. *P. putida* is typically found in the natural environment (soil, water, the oropharyngeal flora, and occasionally in the hospital environment). Although most often associated with indwelling catheters and hospital-acquired pneumonias, its spectrum of infection includes urinary tract infections, acute cholecystitis, cholangitis, tonsillitis, thrombophlebitis, septicemia, meningitis and peritonitis. The organism often causes nosocomial infections in those who are immunocompromised and have medical devices. *P. putida* SSTI and bacteremia are both rare but lethal cases have been described in the literature.

CONCLUSION: Although infections caused by *P. putida* remain uncommon, in the last several decades, it has emerged as an important cause of nosocomial infections particularly in immunocompromised patients. Furthermore, multidrug-resistant and carbapenem-resistant *P. putida* isolates are increasingly being reported in literature. Fatal cases of *P. putida* infection, both soft tissue and bacteremia, have also been reported. It is critical for clinicians to be aware of the potential fatality of nosocomial *P. putida* infections and initiate early and appropriate antibiotic regimen.

PULMONARY MUCORMYCOSIS IN A PATIENT WITH MYELODYSPLASTIC SYNDROME AND TUBERCULOSIS

Akane Ariga; Tamaki Kakuwa; Jin Takasaki; Akinari Tsukada; Shuichiro Matsumoto; Eriko Morino; Moe Kato; Toru Igari; Yoshitaka Shida; Shinya Izumi; Haruhito Sugiyama. National Center for Global Health and Medicine, Tokyo, Japan. (Control ID #3184821)

LEARNING OBJECTIVE #1: 1. Consider pulmonary infarction and/or abscess if CT images show a non-aerated, low-density area associated with emboli inside central vessels, or if needle biopsy cannot obtain adequate specimens. 2. Consider a transvascular approach (e.g., right cardiac catheterization) in addition to a percutaneous or transbronchial biopsy, to obtain histological findings that can definitively confirm a mucormycosis diagnosis. 3. Superinfection is always possible, regardless of culture results.

CASE: An 85-year-old man, who had been treated for myelodysplastic syndrome and tuberculosis for several months, presented with subacute fever and worsening left-side chest pain. Contrast-enhanced CT images showed a massive tumor-like consolidation without enhancement, expanding from the left lower lobe. We detected emboli in left descending pulmonary artery. Sputum and abscess cultures were positive for *Enterococcus faecium*, but no fungal species. Despite intensive treatment, he developed multiple organ failure and died 47 days after hospitalization. Histological examination of the lung autopsy specimen showed invasive mycelium growth by *Mucor* species in vessels and pulmonary emboli, which did not respond to anticoagulants; it was recognized as the direct

cause of death. *Mucorales* were identified by both real-time polymerase chain reaction and immunohistological analyses of lung tissue.

IMPACT/DISCUSSION: Mucomycosis is a life-threatening infectious disease, seen in immunocompromised patients, such as those with hematological malignancies. As its clinical symptoms and radiological findings vary, and specific biomarkers and culture findings for mucormycosis have not been defined, histological findings are usually necessary to confirm a definitive diagnosis of mucormycosis. Mucomycosis is known to invade vessels, and is associated with embolism or infarction, which may be seen on CT images. Therefore, if CT images show a non-aerated, low-density area with emboli inside central vessels, especially in immunocompromised patients, a pulmonary infarction produced by mucormycosis is worth considering. Pulmonary infarction should also be considered when CT images show an abscess-like area, but needle biopsy cannot gather adequate pus-like specimens. A transvascular approach to obtain a histological sample (such as right cardiac catheterization), in addition to a percutaneous or transbronchial biopsy, may help confirm a definitive diagnosis of mucormycosis. Finally, superinfection is always possible, regardless of the culture results, especially when the appropriate antibiotic is inadequate.

CONCLUSION: We encountered a case of pulmonary mucormycosis in a patient with myelodysplastic syndrome and tuberculosis. Mucomycosis should be considered when intensive care according to culture results is not successful, especially for patients in immunosuppression and/or with abnormal CT images. Development of new diagnostic methods for mucormycosis including a transvascular approach is expected.

PUPPY LOVE: A CASE OF CAPNOCYTOPHAGA CAUSING SEPTIC POLYARTHRITIS FAVORING PROSTHETIC JOINTS

Jennifer Rodriguez; Michael G. Simonson; Allison DeKosky. University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #3185891)

LEARNING OBJECTIVE #1: To diagnose prosthetic joint infection on synovial fluid analysis

LEARNING OBJECTIVE #2: To recognize Capnocytophaga as a rare etiology for prosthetic septic arthritis

CASE: An 84-year-old otherwise healthy and active female with a history of bilateral total knee and right shoulder replacements presented to the hospital with fever (38.5°C), diarrhea, and confusion. Initial chemistries demonstrated a WBC $9 \times 10^9/L$, CRP 33mg/dL, and ESR 46mm/hr; however, viral and bacterial infectious work-up, including serologic and radiologic testing, were completely negative. Stool culture was not obtained due to lack of bowel movement. On hospital day 3, she developed acute arthritis with effusion of her left prosthetic knee. Arthrocentesis revealed cloudy synovial fluid with 33,350cells/uL without organisms, but repeat blood cultures reported growth of anaerobic gram-negative rods. She underwent surgical washout of the joint and was started empirically on vancomycin and ampicillin-sulbactam. She subsequently developed pain in the right knee and shoulder joints. Arthrocentesis of the newly involved joints revealed similarly elevated cell counts without crystals or organisms and she was taken again for washout. On hospital day 7, blood cultures speciated as Capnocytophaga spp. Notably, her social history revealed she kisses and shares a bed with her dog, who has a disorder of sialorrhea and who was also experiencing diarrhea. Antibiotics were transitioned to a 6-week course of ertapenem prior to discharge and she later presented in improved condition to outpatient clinic. She will subsequently require life-long amoxicillin-clavulanate suppression therapy.

IMPACT/DISCUSSION: Prosthetic joint infection is a serious clinical entity associated with significant morbidity and mortality. The cutoff value for identifying patients with prosthetic joint infections is lower than in a native joint; a synovial fluid leukocyte differential of >65% neutrophils or a leukocyte count of $>2 \times 10^3/\text{L}$ is highly predictive of prosthetic joint infection. *Capnocytophaga canimorsus* is a rarely encountered pathogen in humans but commonly part of canine oral flora. Infection with *Capnocytophaga* spp. can progress rapidly to sepsis and death if not appropriately diagnosed and treated.

CONCLUSION: *Capnocytophaga* spp. are capnophilic gram-negative rods that can be difficult to grow under standard microbiology lab conditions. Infection with these organisms has been noted to appear initially ‘culture-negative,’ without sufficient proinflammatory response, later rapidly progressing to sepsis, arthritis, DIC, and death. Septic arthritis due to *Capnocytophaga* in the immunocompetent patient without trauma is rare. There has previously been one report of prosthetic joint infection of the hip with *Capnocytophaga*, however infection in that instance was described as indolent, which is atypical for this organism. To our knowledge, this is the first case reported of acute septic polyarthritis with preferential involvement of prosthetic joints by *Capnocytophaga* in humans.

PURPURA FULMINANS: A RARE CONDITION WITH A POOR PROGNOSIS

Munther M Queisi¹; Sehar Zulfiqar¹; Shazia Samanani²; Mary Jo Farmer¹. ¹University of Massachusetts - Baystate (UMMS), Springfield, MA; ²Baystate Medical Center, Springfield, MA. (Control ID #3186012)

LEARNING OBJECTIVE #1: Recognize early signs and symptoms of Purpura Fulminans in the acute setting

CASE: A 64-year-old female with a complicated past medical history including ischemic colitis with partial resection, rheumatoid arthritis, methotrexate induced interstitial lung disease, Graves' disease post thyroidectomy, and CKD presented to the hospital with right upper quadrant abdominal pain. While in the ED she became hypoxic and suffered a PEA arrest. After resuscitation, she was admitted to the ICU and work up revealed septic shock from ascending cholangitis with *E. coli* bacteremia. She underwent ERCP and sphincterotomy and required pressor support for hypotension. Over the next few days she began complaining of pain in her distal extremities and developed necrotic skin lesions over her acral surfaces described as hyperpigmentation with dusky and necrotic appearing fingers and toes as well as bullous ulcerations and surrounding purpura. DIC and heparin-induced-thrombocytopenia were both ruled out as the cause. Vascular Surgery was consulted and advised discontinuing vasopressors, but despite this her lesions rapidly worsened. Shortly after, she was diagnosed with Purpura Fulminans. A few days later despite discontinuation of pressors and aggressive wound care, her necrotic lesions worsened, and she underwent bilateral below the knee amputations.

IMPACT/DISCUSSION: Purpura fulminans (PF) is rare life threatening emergency among critically ill patients, characterized by the appearance of purpuric rash predominantly in the distal extremities. The rash progresses into sharply demarcated, symmetric, blue or purple discoloration that further evolves to black. These then become larger, confluent ecchymotic lesions and later on, haemorrhagic bullae leading to hard eschars of necrotic tissue. This condition occurs due to dermal microthrombosis and disseminated intravascular necrosis of the venules and capillaries, eventually evolving into deep skin necrosis. Multi-organ failure is

common secondary to microthrombi in vessels supplying the organs. Management of PF is supportive with adequate hydration, discontinuation of vasoconstrictors and treating the inciting issue. The most common pathogens of sepsis-induced PF are *N. meningitidis*, *S. pneumoniae*, *S. Aureus*, and *Clostridia* species, and if the organism is unknown broad-spectrum antibiotics are usually initiated to include coverage of these organisms. Anticoagulation may be started to prevent further necrosis. In severe cases, surgical debridement can be done in situations of skin necrosis, and this has shown to reduce mortality. Despite these interventions PF is associated with a poor prognosis with mortality exceeding 50%. In those who survive, one-fourth require a quadruple limb amputation. **CONCLUSION:** The purpose of this abstract is to raise awareness on the importance of recognizing and managing cases of rare purpura fulminans with immediate action as to avoid limb amputations and death in the setting of septic shock.

PYLEPHLEBITIS IN A WOMAN WITH DIVERTICULITIS

Rachael Stovall; Chongjia Chen. Boston University Medical Center, Boston, MA. (Control ID #3185999)

LEARNING OBJECTIVE #1: Recognize the subtle presentation of pylephlebitis

LEARNING OBJECTIVE #2: Distinguish the risk factors for developing pylephlebitis

CASE: An 86-year-old woman with a history of congestive heart failure, hypertension, chronic kidney disease and diverticulosis presented with three days of fever, anorexia, weakness, nausea and non-bloody diarrhea. She denied vomiting or abdominal pain. She recalls eating a steak and cheese sandwich 24 hours prior to the onset of her symptoms. She denied recent travel, sick contacts, and prior abdominal surgery. She had no alcohol, tobacco or illicit substance use. In the emergency department, she had no flatus or bowel movements. Vitals were notable for a temperature of 100.9 F, blood pressure of 120/56 mm Hg, heart rate of 76 beats per minute, respiratory rate of 16 breaths per minute, and oxygenation of 98% on ambient air. On examination she had abdominal distention and hypoactive bowel sounds, but no abdominal tenderness. Her laboratory results showed a normal white blood cell count, chronic anemia with a hemoglobin of 9.1 g/dL, low platelets of 91,000 per microliter of blood (baseline 210,000 per microliter of blood), an elevated creatinine level of 2.82 mg/dL (baseline 1.92 mg/dL) and normal liver function tests. An abdominal radiograph was without evidence of obstruction or colonic dilatation. On hospital day one, her temperature rose to 102 F. A CT abdomen and pelvis showed diverticulitis in the sigmoid colon and a concentric thrombus within the inferior mesenteric vein, superior mesenteric vein and portal vein. Blood cultures grew *Bacteroides fragilis* and *Eggerthella lenta*. She was diagnosed with sigmoid diverticulitis causing pylephlebitis and completed four weeks of antibiotics, ultimately on ceftriaxone. She was bridged on a heparin drip to warfarin and continued warfarin treatment for three months. One year later she is doing well.

IMPACT/DISCUSSION: The patient presented with non-specific symptoms, which is common for pylephlebitis and include fevers, chills, myalgias, weakness, nausea, vomiting, abdominal pain and diarrhea. Physical exam can be benign or include abdominal distention concerning for ileus. Laboratory results may show a leukocytosis and mild transaminitis. The patient's low platelets were atypical and may have been from the thrombus as it resolved with treatment. The most common risk factors for development of pylephlebitis are diverticulitis, appendicitis and

pancreatitis. Other factors include cholecystitis, inflammatory bowel disease, malignancy, cirrhosis, tobacco use, prior abdominal operations, anti-platelet therapy and steroid use.

CONCLUSION: Patients with pylephlebitis can present with non-specific symptoms including fatigue and nausea and therefore suspicion must remain high in order to secure the diagnosis. Pylephlebitis should be suspected in patients with abdominal sepsis because of its high mortality rate. Triggers for pylephlebitis include diverticulitis, appendicitis, pancreatitis, cholecystitis and ulcerative colitis.

RAPID-ONSET QUADRIPIARESIS AND RESPIRATORY FAILURE IN A PATIENT THAT WALKED IN TO THE HOSPITAL

Ellen Murray¹; Juan N. Lessing¹; Andrew Levy²; Miranda E. Merrill¹.

¹University of Colorado, Denver, CO; ²University of Colorado Denver, Denver, CO. (Control ID #3184374)

LEARNING OBJECTIVE #1: Recognize the subtle presentation of SEA and the importance of early recognition

LEARNING OBJECTIVE #2: Consider SEA as a diagnosis for acute quadripareisis

CASE: A 75-year-old man presented with 1-week of progressive generalized fatigue and weakness. He reported confusion, slurred speech and difficulty standing, dressing and bathing. He denied numbness, tingling, pain, focal weakness, fever, chills, dyspnea, dysuria or diarrhea. Medical history included type II diabetes mellitus, chronic kidney disease, and eczema with frequent skin wounds. Two weeks earlier he had been treated for leg cellulitis. On exam, he had normal vital signs and his cardiopulmonary exam was normal. He had erythema and a shallow ulcer on his left leg. Strength, sensation and reflexes in all extremities were normal. White blood cell count was $10.8 \times 10^3/\mu\text{L}$, sodium 126 mg/dL, blood urea nitrogen 83 mg/dL, creatinine 2.8 mg/dL and lactate 2.1 mg/dL. Urinalysis was bland. Chest x-ray and CT-head were normal. He received intravenous fluids and cefazolin for cellulitis. Two hours later, he developed dense paresis in bilateral lower-extremities with 1/5 strength and hyporeflexia. Corticosteroids and broad-spectrum antibiotics were administered. While awaiting further neurologic imaging the weakness progressed to his upper-extremities and respiratory muscles requiring intubation. MRI demonstrated a spinal epidural abscess (SEA) extending from C1 to L3 with multi-level spinal cord compression, vertebral osteomyelitis and discitis. Blood cultures and abscess grew MRSA. He developed refractory septic shock and despite aggressive neurosurgical interventions he expired.

IMPACT/DISCUSSION: Extensive SEA is a rare and emergent diagnosis that can lead to quadripareisis and death. Despite being uncommon (2 of 10,000 hospitalizations), the devastating implications of missed or delayed diagnosis of SEA necessitates all clinic and hospital-based internists be aware of this disease. Immune compromised patients, diabetics and intravenous drug users are at risk, however, SEA most frequently occurs from spine instrumentation or bacteremia. Presenting symptoms are subtle: generalized malaise, fevers, back pain, and in some cases, neurologic symptoms. Leukocytosis and elevated ESR are suggestive, however, MRI is diagnostic. Prognosis is poor; 4-20% of cases result in irreversible paraplegia and 5% progress to uncontrolled sepsis and death. Management includes broad-spectrum antibiotics and early surgical intervention. Antibiotic coverage should include Staph Aureus (60%) as well as Strep and gram-negative species. Prompt recognition of this disease and early intervention are keys to its successful treatment.

CONCLUSION: Here we present a case of rapidly progressive paralysis and respiratory failure due to an extensive SEA in a patient presenting with

non-specific symptoms. It is critical to include SEA, although rare, in the differential for generalized weakness and back pain in order to prevent a potentially grave outcome.

RARE CASE OF RHEUMATOID ARTHRITIS MEDIATED CARDIAC TAMPONADE

Nikhila Kethireddy¹; Navya Kuchipudi². ¹University of Connecticut, Hartford, CT, ²University of Connecticut, Farmington, CT. (Control ID #3157854)

LEARNING OBJECTIVE #1: Differential diagnosis for cardiac tamponade including rheumatoid arthritis.

LEARNING OBJECTIVE #2: Promptly stabilize and treat cardiac tamponade due to rheumatoid arthritis.

CASE: 60 year old male with recent diagnosis of seropositive rheumatoid arthritis presented with sudden onset substernal sharp stabbing chest pain without radiation. He denied dyspnea, lightheadedness, recent upper viral respiratory illness or sick contacts. He was tachycardic to 130-150's and hypotensive to 90/70. Physical exam is pertinent for reduced heart sounds, normal JVP, negative for distended neck veins. White count of 37,500, platelets 528. Troponins peaked at 0.12, elevated ESR 118 and CRP at 1.6 (reference <0.8). EKG showed sinus tachycardia. Transthoracic echocardiogram showed a pericardial effusion with tamponade physiology. Pericardiocentesis with pigtail catheter placement was performed. Pericardial fluid analysis showed turbid yellow fluid with elevated inflammatory cells (60000 nuclear cells with 90% polys), high LDH 1188, low glucose at 35. Bacterial gram stain, culture, cytology for malignant cells, adenosine deaminase (ADA) and mycobacterium tuberculosis culture and smear were negative. This was consistent with an inflammatory effusion due to RA. He was started on colchicine, IV solumedrol which was transitioned to oral prednisone. The hydroxychloroquine was restarted and methotrexate was added. Upon follow up, his pericardial effusions subsided upon repeat TTE and he remains asymptomatic.

IMPACT/DISCUSSION: Rheumatoid arthritis is a chronic autoimmune disease with 1% prevalence among the general population. Incidence of pericardial effusion in individuals with RA on autopsy varies from 11% to 50%. Silent pericardial effusion is seen more frequently than acute symptomatic pericarditis. Symptomatic rheumatoid pericardial effusions are uncommon and seen in older individuals with long standing RA. RA is one of the least common causes of cardiac tamponade with a prevalence of 0.22% to 0.5%. There are multiple etiologies for pericardial effusions including viral, bacterial, uremic, neoplastic, tuberculosis, connective tissue diseases, traumatic, medications and idiopathic. Underlying pathophysiology that leads to pericardial effusions in rheumatoid arthritis includes vasculitis via immune complex deposition with inflammatory cell infiltration. Pericardiocentesis with fluid analysis can provide detailed information which can help narrow the diagnosis. In rheumatoid pericardial effusion the pH is low, high white count, high LDH, very low glucose concentration. In this case, his history of rheumatoid arthritis provided a clue and pericardial fluid analysis being consistent with effusion due to RA further helped establish the etiology.

CONCLUSION: In conclusion, rheumatoid arthritis causing pericardial effusion with cardiac tamponade should be in the differential in individuals who present with acute cardiac chest pain even in those without long standing rheumatoid arthritis.

RARE DIAGNOSIS OF PHEOCHROMOCYTOMA AT AN UNCOMMON AGE OF 96 YEARS

Shiva Shankar Vangimalla; Srinivasa Kasina; Hussam Ammar. Medstar

Washington Hospital Center, Washington, DC. (Control ID #3185847)

LEARNING OBJECTIVE #1: Recognize the clinical presentation of pheochromocytoma in elderly population

LEARNING OBJECTIVE #2: Recognize that guidelines for surgical interventions are not clear for elderly population

CASE: A 96 year female with a past medical history of coronary artery disease status post percutaneous coronary intervention, heart failure with reduced ejection fraction, hypertension, and hypothyroidism was admitted for acute hypotension and bradycardia. Vital signs on admission were blood pressure 79/42 mm Hg, heart rate 56 beats per minute, temperature 36.4 C. She was confused and drowsy on admission. Initial laboratory work up was notable for hemoglobin 8.9 mg/dl, creatinine 5.07mg/dl, elevated thyroid stimulating hormone 57.4 uIU/ml, low free thyroxine 0.35 ng/dl. EKG showed sinus bradycardia without any other acute changes. Chest X-ray did not show any acute cardio-pulmonary process. Urine and blood cultures remained with no growth. Vital signs improved with adequate fluid resuscitation. However, over the next few hours, she developed an episode of hypoglycemia (serum glucose - 41mg/dl) and hypothermia (34.2C) that resolved with administration of intravenous (IV) dextrose and brief trial on bair-hugger. Concerning for severe hypothyroidism with impending myxedema coma, she was treated with stress dose IV hydrocortisone and IV levothyroxine. Adrenal insufficiency was ruled out by elevated random serum cortisol of 41.1mcg/dl. Hospital course was complicated by labile blood pressures, systolic blood pressure ranging from 90s-270s and diastolic blood pressure ranging from 40s-130s. Review of her past medical records revealed 4 x 4 cm heterogeneous mass arising from left adrenal gland that was incidentally found on a CT scan of abdomen/pelvis in 2016 for hospitalization for nausea and vomiting. Lab work up now revealed elevated plasma metanephrenes 6.12 nmol/L, elevated plasma normetanephrenes 12.81 nmol/L, elevated 24 hour-urine fractionated metanephrenes 3118 mcg/day, elevated 24 hour-urine normetanephrenes 3291 mcg/day confirming the biochemical diagnosis for pheochromocytoma. She was discharged home on low dose alpha blocker (doxazosin) for blood pressure control. Later, patient and her family refused any surgical intervention given her age and other co-morbidities but agreed for optimal medical therapy.

IMPACT/DISCUSSION: Guidelines for surgical management in the elderly are not clear An open discussion about surgical risks/benefits and its impact on overall quality of life is warranted Medical therapy with regular follow up remains a reasonable choice in such patients Our patient of 96 years at the time of diagnosis may be the oldest living individual reported with pheochromocytoma to the best of our knowledge

CONCLUSION: A high index of clinical suspicion is needed to work up pheochromocytoma in elderly given its highly variable clinical presentation Biochemical confirmation should be followed by radiological evaluation for the diagnosis Medical therapy alone might be a reasonable choice in high-risk elderly patients

RARE SUBTYPE AUTOIMMUNE ENCEPHALITIS WITH REFRACTORY NON-CONVULSIVE STATUS EPILEPTICUS: DIAGNOSTIC CHALLENGE

Yasir Loai; Riffat Sabir. Baystate Medical Center, Springfield, MA. (Control ID #3181725)

LEARNING OBJECTIVE #1: Recognize atypical presentation of autoimmune encephalitis in patients with refractory seizures

LEARNING OBJECTIVE #2: Treat suspected autoimmune encephalitis empirically and monitor for interval change

CASE: 33-year-old female with past medical history of depression, anxiety,

prior alcohol and cocaine abuse, and newly diagnosed epilepsy admitted for evaluation of recurrent witnessed tonic-clonic seizures despite full adherence to antiepileptic drugs (AED). Routine labs were remarkable for significantly elevated lactate, negative urine toxicology screen, and therapeutic AED level. Computed tomography of head (CT) and magnetic resonance imaging of brain (MRI) showed no abnormal intracranial pathology. Cerebrospinal fluid (CSF) revealed normal glucose and protein levels without presence of cells or oligoclonal bands, with negative viral panel and cultures. Patient course further deteriorated by new onset psychosis, echolalia, blank stares, automatic obedience, catatonia, posturing and purposeless activity. Psychiatry was consulted for evaluation of depressive catatonia, however patient failed to respond to IV lorazepam challenge. Immediate 72-hour Video EEG recorded disorganized slowing with frequent 2 Hz spike and wave discharges consistent with diffuse epileptiform encephalopathy. With progressive decline in mentation, refractory seizure activity, and failure to respond to AED cocktail, patient was commenced on empiric therapy with high dose IV methylprednisolone and immunoglobulin (IVIG) for presumed autoimmune encephalitis. Within 24 hours patient showed remarkable response with near full resolution of neurological symptoms. Extensive autoimmune and paraneoplastic workup a week later demonstrated elevated P/Q Voltage gated calcium channel (VGCC) type antibodies, thus establishing diagnosis of autoimmune encephalitis.

IMPACT/DISCUSSION: Autoimmune encephalitis (AE) is an antibody mediated inflammation of the brain primarily involving limbic system. AE can be broadly classified into paraneoplastic and non-neoplastic with P/Q type VGCC encephalitis being a rare subtype of AE. Clinical presentation can be variable as patients may present with neuropsychiatric or neurological symptoms including seizures, cognitive impairment and autonomic dysfunction. There appears to be no single diagnostic measure that can make this diagnosis in isolation, as small subset of patients will not have any neuroimaging findings despite profound neuropsychiatric symptoms. Therefore, internists need to have high clinical index of suspicion especially in patients not responding to conventional therapy and consider early empiric initiation of corticosteroids and IVIG until disease confirmation by serological testing.

CONCLUSION: Consider diagnosis of AE in patients with neuropsychiatric presentation not improving with AED Initiating empiric treatment with IV steroids and IVIG is warranted for management of presumed autoimmune encephalitis if high clinical index of suspicion

RASH AND LIVER DISEASE IN A PATIENT WITH ROUX-EN-Y GASTRIC BYPASS

Julie C. Sung¹; Genevieve Tuveson¹; Leona Kim-Schluger²; Mayce Mansour¹. ¹The Mount Sinai Hospital, New York, NY; ²Icahn School of Medicine at Mount Sinai, New York, NY. (Control ID #3184726)

LEARNING OBJECTIVE #1: Recognize the clinical features of nutritional deficiencies in patients who have received bariatric surgery

LEARNING OBJECTIVE #2: Understand patient characteristics and clinical manifestations of zinc deficiency

CASE: A 35-year-old female with history of Roux-en-Y gastric bypass (RYGB) in 2015, alcohol use disorder in remission, and recurrent gallstone/alcoholic pancreatitis presented with abdominal pain and rash. Patient had normal vitals on presentation. Physical exam remarkable for jaundice and diffuse abdominal pain, but most notable for a palpable, painful purpuric rash over abdomen, lower back, and upper and lower extremities. Noted to have desquamation over dorsum of feet, sparing the palms and soles. Labs notable for AST/ALT 54/26 with Tbili/Dbili 4.4/3.4 with alkaline phosphatase 103. Given elevated liver function tests and rash, patient underwent infectious and

rheumatologic work-up which was unrevealing. Liver biopsy showed evidence of both biliary fibrosis and alcoholic steatohepatitis, with no evidence of cirrhosis. Urine testing came back positive for alcohol. Skin biopsy of rash showed necrolytic acral erythema. Zinc level was then obtained which showed a low level of 29. Given otherwise negative work up, rash was likely caused by a zinc deficiency. At discharge, patient was started on zinc supplementation and referred as an outpatient to liver medicine for follow-up of her alcoholic steatohepatitis and to surgery for cholecystectomy.

IMPACT/DISCUSSION: Gastric bypass surgery, especially RYGB, can put patients at risk for numerous side effects related to changes in absorption. A particularly unique aspect to this case is the purpuric rash. Initial presentation with palpable purpura and new-onset liver disease was concerning for possible vasculitis, however skin biopsy showed necrolytic acral erythema. Necrolytic acral erythema is a rare condition first described among a small cohort of hepatitis C carriers in Egypt in 1996. It is described as a pruritic, hyperkeratotic, and erythematous eruption that affects acral surfaces. However, a few case reports in the literature have described this skin finding in zinc deficiency. Interestingly, the incidence of zinc deficiency occurs almost five times more frequently in RYGB patients than in gastric sleeve patients. RYGB is well-known to be associated with increased risk of iron and B12 deficiencies; however, this case demonstrates other micronutrient deficiencies that should be recognized by practitioners. This is especially critical in complex patients who may have alternative and highly plausible etiologies for possible disease processes.

CONCLUSION: Patients with history of RYGB are at high risk of zinc deficiency. Zinc deficiency can manifest as a purpuric and desquamating rash known as necrolytic acral erythema.

RECTAL PAIN IN A YOUNG MAN

Rand Dadasovich, University of California, San Francisco, San Francisco, CA. (Control ID #3183212)

LEARNING OBJECTIVE #1: Recognize the clinical presentation of lymphogranuloma venereum (LGV)

LEARNING OBJECTIVE #2: Describe the changing epidemiology of LGV

CASE: A previously healthy 29 year-old man presented to an urban public health clinic with 4 days of dyschezia, bloody rectal discharge, and tenesmus. He reported no fevers, chills, abdominal pain, diarrhea, anal pruritis, rash, arthralgias, or other systemic symptoms. He had no history of hemorrhoids and no family history of IBD or other autoimmune diseases. The patient identified as a gay man and reported unprotected receptive anal sex with a new male partner ten days earlier. His only medication was PrEP, started two years earlier. Vital signs were within normal limits. Examination revealed normal external genitalia, no visible lesions or rash, and no inguinal lymphadenopathy. Anoscopy revealed a thin milky discharge and several small linear non-bloody mucosal ulcerations on the posterior rectal wall. Specimens were collected and sent for testing of chlamydia, gonorrhea, HSV, LGV, syphilis, and HIV. The patient was treated empirically with IM ceftriaxone and a 7-day course of doxycycline. LGV PCR returned positive and the course of doxycycline was extended to 21 days.

IMPACT/DISCUSSION: LGV is caused by 3 serovars of Chlamydia trachomatis that are more invasive than those that cause common chlamydial infections. In the classical presentation, primary LGV infection presents as a small painless genital ulcer at the site of inoculation approximately 3 to 30 days after exposure. Secondary infection appears two to six weeks later as a result of direct extension of the infection to regional lymph nodes, which then leads to lymph node necrosis and abscess formation. In contrast to the classic

urogenital presentation, LGV can also produce an anorectal syndrome characterized symptoms of proctocolitis: rectal discharge, anal pain, constipation, fever, and tenesmus. The presentation can be mistaken for IBD and complications include chronic colorectal fistulas and strictures if untreated. LGV was previously considered a tropical disease, endemic among heterosexuals in East and West Africa, India, Southeast Asia, and the Caribbean. There have been increasing reports of LGV since 2003 in temperate climates, including large outbreaks seen in UK and NYC, primarily among MSM. Among 327 cases of LGV identified in the UK from 2004-2006, the major symptoms included rectal discharge (79%), pain (69%), rectal bleeding (58%), tenesmus (29%), and constipation (25%). Only four percent of patients had concomitant urogenital LGV. Risk factors included HIV-positivity, history of recent unprotected anal sex, and MSM (Ward et al, 2007).

CONCLUSION: Contrary to the classic urogenital presentation mostly observed in the developing world, LGV can also present as an anorectal syndrome characterized by rectal discharge, anal pain, constipation, fever, and tenesmus. Consider LGV in patients presenting with acute proctocolitis, especially if MSM and reporting recent unprotected anal sex.

REFRACTORY HYPERCALCEMIA AS A KEY TO THE DIAGNOSIS OF A RARE CASE OF CO-EXISTING HODGKIN'S LYMPHOMA AND ADULT T-CELL LEUKEMIA/LYMPHOMA.

Lakshmi Priyanka Mahali; Nikita Fernandes; Colette Knight. Montefiore Medical Center, Bronx, NY. (Control ID #3184554)

LEARNING OBJECTIVE #1: Identify that refractory hypercalcemia can be a marker of both disease progression and also development of a new malignancy.

LEARNING OBJECTIVE #2: Recognize HTLV1-associated ATLL as a cause of relapsing hypercalcemia of malignancy.

CASE: 63 year old Jamaican woman presented with generalized bone pain, headache, nausea and mild abdominal pain. The patient was diagnosed with Hodgkin's lymphoma two years ago and was treated with 6 cycles of ABVD(doxorubicin, bleomycin, vinblastine and dacarbazine) which resulted in marked reduction of adenopathy. Post-treatment Positron Emission Tomography(PET/CT) scan showed resolution of disease. Nearly 1 year after completing chemotherapy, the patient had several admissions for hypercalcemia that was refractory to the usual treatment. During this admission, labs were significant for calcium(Ca): 16 mg/dl, white blood cell count: 26,000 k/ul with lymphocytosis, 1,25 hydroxy vitamin D(calcitriol): 10 pg/ml, parathyroid hormone(PTH): 10 pg/ml, parathyroid hormone-related protein(PTHrP): 32 pg/ml and alkaline phosphatase(ALP): 328U/l. PET scan showed no increase in adenopathy. The recurrent episodes of hypercalcemia despite no increase in tumor burden raised concern that there was an alternate cause of hypercalcemia. Further evaluation included peripheral blood flow cytometry which was consistent with Adult T-cell Leukemia/Lymphoma (ATLL). Human T Lymphotropic Virus type 1 (HTLV-1) infection was confirmed by western blot.

IMPACT/DISCUSSION: Persistent hypercalcemia that fails to respond to standard therapy may represent worsening of the primary cause or a co-existing disease process. Hypercalcemia of malignancy occurs by several mechanisms, which include tumor secretion of PTHrP, tumor production of 1,25-dihydroxyvitamin D and local release of cytokines by osteoclasts(OCLs). Increased production of 1,25-dihydroxyvitamin D due to increased expression of 1-alpha hydroxylase is the cause of almost all cases of hypercalcemia in Hodgkin's lymphoma. Hypercalcemia in ATLL is due to marked bone resorption by osteoclasts via receptor activator of nuclear factor kappa- ligand (RANK-L) over-expression, but in some cases can also be

PTHrP-mediated. In this case the low calcitriol, low PTH and elevated PTHrP is a pattern that is consistent with hypercalcemia due to ATLL. HTLV is endemic in the Caribbean islands and is a major cause of ATLL, either de novo or reactivation after an infection. Case reports have shown reactivation of HTLV after induction chemotherapy for treatment of other cancers. However, it is extremely uncommon for Hodgkin's and ATLL to exist in the same patient as was observed in this case.

CONCLUSION: Alternate diagnosis or co-existing malignancy should be suspected in cases of refractory hypercalcemia, despite optimal therapy. Hypercalcemia of malignancy occurs via different mechanisms, understanding of which helps identify the underlying malignancy.

REFRACTORY ORTHOSTATIC HYPOTENSION, WEAKNESS, & PARASTHESIAS IN A VIETNAM VETERAN EXPOSED TO AGENT ORANGE

Rogelio M. Cruz, NYU, New York City, NY. (Control ID #3186278)

LEARNING OBJECTIVE #1: Recognize the clinical manifestations of AL Amyloidosis and its association with Agent Orange

LEARNING OBJECTIVE #2: Management of refractory orthostatic hypotension

CASE: A 68 year-old man with prior Agent Orange exposure in Vietnam presents with 6 months of progressive orthostatic hypotension (OH), syncope, 60 lb weight loss, and lower extremity weakness, parasthesias, and allodynia. Prior workup found mildly elevated troponin and BNP, but a normal stress test. Midodrine had no improvement in OH, and BP on admission dropped 138/75 to 67/42. Exam showed lack of pupillary reaction to accommodation, anhidrosis, urinary retention, 3/5 strength in both legs, and decreased sensation below the knees. Routine labs were unremarkable, MRI brain, C/T/L spine was noncontributory, and CT C/A/P showed no malignancy. TTE revealed severe Bi-V hypertrophy and a small pericardial effusion. Further workup showed increased serum lambda () free light chains, and urine immunofixation revealed faint monoclonal free elevation. Cardiac MRI showed LVEF 38% with diffuse subendocardial gadolinium enhancement suggestive of amyloid cardiomyopathy. An abdominal fat pad biopsy was inconclusive so a Cardiac biopsy was done, confirming AL amyloid (AL) deposition. Bone Marrow biopsy stained positive for amyloid and exhibited a population of lambda-restricted plasma cells (<10%) consistent with plasma cell dyscrasia. TTR amyloid genetic testing was negative. EMG & NCS showed axonal large fiber polyneuropathy favoring amyloid over inflammatory demyelinating neuropathy. Paraneoplastic and autoimmune blood panels were negative. Controlling the OH was difficult despite a slew of non-pharmacologic interventions such as abdominal binders, and max dose Florigine & Midodrine. Addition of Droxidopa was required to control symptoms. He was discharged with plans to start chemotherapy.

IMPACT/DISCUSSION: AL amyloidosis is an accumulation of monoclonal Ig light chains into pathologic fibrils that deposit in extracellular spaces and result in tissue dysfunction and cell death, known as proteotoxicity. Our patient showed cardiac involvement as well as autonomic, sensory and motor neuropathy, but manifestations vary depending on location and amount of deposition. Also, while not causal, recognition that the Dept. of Veteran Affairs lists AL as a disease associated with Agent Orange based on limited suggestive evidence is relevant to this case. At least one study found an odds ratio of 3.02. Pharmacologic management of OH includes fludrocortisone, which increases sodium and water reabsorption, and midodrine, an alpha-1 agonist, which increases vascular resistance. Droxidopa is an oral synthetic precursor to norepinephrine and while not studied in AL, did show a benefit in OH in familial amyloid polyneuropathy and was FDA approved in 2014 for OH.

CONCLUSION: The mainstay of treatment for AL is chemotherapy directed at the plasma cell dyscrasia producing the abnormal protein. Immunotherapies targeting the amyloid deposits are currently in development.

RELAPSING POLYCHONDRITIS MASQUERADING AS INFECTIOUS CELLULITIS

Stephanie C. Opusunju; Leigh K. Hunter. Methodist Dallas Medical Center, Dallas, TX. (Control ID #3162008)

LEARNING OBJECTIVE #1: 1. Recognize predisposing factors for relapsing polychondritis

LEARNING OBJECTIVE #2: 2. Distinguish manifestations of relapsing polychondritis from other diagnoses with similar presentations

CASE: A 40-year old African American man presented to the emergency department with three days of facial swelling and tinnitus, was initially diagnosed with facial cellulitis and treated with empirical antibiotics. After two days of minimal improvement, otorhinolaryngology consultation was requested. Physical examination revealed bilateral chondritis with swelling of the nasal tip, extension to periorbital areas and malar eminences, swelling of the cartilaginous portions of ears with sparing of lobules, and signs of conjunctivitis. Diagnosis of Relapsing polychondritis (RP) was established based on McAdam's criteria which requires three or more of the following clinical findings: bilateral auricular chondritis, non-erosive, seronegative inflammatory polyarthritis, nasal chondritis, ocular inflammation (conjunctivitis, keratitis, scleritis/episcleritis, uveitis), respiratory tract chondritis (laryngeal and/or tracheal cartilages), and cochlear and/or vestibular dysfunction (neuro-sensory hearing loss, tinnitus, and/or vertigo). Of interest, rheumatoid factor and erythrocyte sedimentation rate were also elevated and HIV antibody was positive. The patient declined biopsy but was treated with high dose glucocorticoid therapy resulting in complete resolution of symptoms. The patient was lost to follow up post-discharge.

IMPACT/DISCUSSION: Auricular chondritis, arthritis, nasal chondritis, ocular inflammation, laryngotracheal symptoms, reduced hearing, and vestibular dysfunction are the most common manifestations of RP. Diseases reported in association with RP include systemic vasculitides, rheumatoid arthritis, connective tissue diseases, spondyloarthritis, hematologic diseases, gastrointestinal diseases and other miscellaneous entities such as Sweet's syndrome, retroperitoneal fibrosis, familial Mediterranean fever, sarcoidosis, and immune restoration syndrome. It is imperative that internal medicine physicians recognize the constellation of symptoms of RP in order to avoid diagnostic and treatment delays. Optimal treatment remains an area of active investigation, but immunosuppression is the mainstay.

CONCLUSION: Relapsing polychondritis is a potentially fatal multi-system connective tissue disorder primarily involving cartilaginous structures of ears, eyes, joints, nose, laryngotracheobronchial tree, costal cartilages and proteoglycan rich structures including the heart, kidney, and blood vessels and is characterized by recurrent episodes of inflammation. Because of its rarity, the diagnosis may prove challenging for clinicians resulting in treatment delays and increased morbidity and mortality.

RELIEVING THE PRESSURE A NOVEL APPROACH TO INTESTINAL PSEUDO-OBSTRUCTION WITH RECTAL FOLEY DECOMPRESSION

Dorjan Pantic; Ceena Chandrabos; Linda Kurian. Hofstra Northwell School of Medicine, Manhasset, NY. (Control ID #3140347)

LEARNING OBJECTIVE #1: possible management for intestinal pseudo-obstruction with rectal Foley catheter placement

CASE: We present a novel approach for bowel decompression in Ogilvie syndrome using a rectal Foley catheter. This case series consists of two elderly male bed-bound patients, with recurrent hospital admissions for intestinal pseudo-obstruction with resultant colonic dilation, also known as Ogilvie's syndrome. While this syndrome has been associated with trauma, infections, and abdominal surgeries, it is also frequently seen in patients with prolonged immobility or bed bound state. In such cases, we theorize that decreased abdominal pressure from abdominal muscle laxity allows for increased gaseous distention of the large bowel, resulting in sigmoid colon kinking and subsequent functional outlet obstruction. Both patients presented with severe abdominal distention, and hyperactive bowel sounds. Abdominal CT imaging in both cases showed lack of anatomic obstruction but significant colonic dilation with cecal dilation > 9 cm. Traditionally, these patients are treated with rigid rectal tubes or endoscopic decompression. Our initial patient was initially treated with a rigid rectal tube; however, due to routine patient care, the tube became dislodged resulting in reaccumulation of gaseous distention. Subsequently, a 24 French 3-way straight Foley catheter was placed into the rectum with balloon cuff inflation using 25ml of sterile water. The catheter was left to drain by gravity with standard Foley catheter tubing and frequent bag emptying. After 24 hours the bowel distention improved and serial abdominal X-rays confirmed bowel decompression. The second case was seen in the emergency department. As before, a Foley catheter was placed into the rectum and connected to catheter tubing and subsequently removed after 6 hours with marked improvement in colonic distention allowing for the patient to be discharged without hospital admission.

IMPACT/DISCUSSION: The use of a Foley catheter to straighten the sigmoid colon enables an outlet for gas and stool. This procedure may be superior to a rectal tube in the ability to remain in place for enough time to successfully decompress colonic distention. Rectal Foley placement does not require advanced training and causes minimal patient discomfort. It can potentially decrease cost of patient care as it does not require advanced procedures or sedation and is cheaper than other methods of decompression.

CONCLUSION: Both patients had recurrent pseudo-obstruction potentially resulting from decreased abdominal wall strength due to prolonged immobility allowing for colonic expansion in the setting of a relative decrease in intra-abdominal pressure. Both cases subsequently resolved with rectal Foley catheter decompression. Foley catheters are readily available and can be safely placed in patients with large bowel distention due to Ogilvie syndrome. The risk of the procedure is similar to that of a rectal tube and its placement does not require additional expertise.

RENAL CELL CARCINOMA PRESENTING WITH DYSPHAGIA: A CASE REPORT

Zion Lamm; Andrew Dries; Kevin Humphreys; KEVIN LAMM. Carolinas Medical Center, Charlotte, NC. (Control ID #3184874)

LEARNING OBJECTIVE #1: Be able to define and diagnose achalasia and pseudoachalasia.

LEARNING OBJECTIVE #2: Recognize that rapidly progressive achalasia may be due to a paraneoplastic process.

CASE: A 77-year-old female with history of diabetes and vitiligo presented to clinic with progressive dysphagia to solid food and twenty-pound weight loss over six months. Barium esophagram revealed prominent narrowing of the distal esophagus with tertiary contractions. Follow-up with esophageal manometry showed panesophageal pressurization >30mmHg, suggesting Type II achalasia. A puckered lower esophageal sphincter was noted on esophagogastroduodenoscopy. Subsequent endoscopic ultrasound uncovered a lobulated mass measuring 9cm in the lower pole of the left kidney. Given

dysphagia and findings of achalasia by manometry thought to be due to paraneoplastic syndrome, 100u of botox was injected into the LES. Patient ultimately underwent left radical nephrectomy for unclassified renal cell carcinoma.

IMPACT/DISCUSSION: Achalasia is a rare motility disorder of the esophagus in which loss of neurons traditionally lead to a slow decline of peristalsis and impaired relaxation of the lower esophageal sphincter (LES). Rapid progression of symptoms including dysphagia and unintentional weight loss suggests pseudoachalasia most often due to a malignancy. Though most cases are due to direct infiltration, primary cancers from lung, prostate, and kidney have been described to create a paraneoplastic syndrome that disrupts esophageal function by anti-neuronal and anti-cholinergic antibodies. We present a case report of a patient diagnosed with achalasia due to a paraneoplastic process from renal cell carcinoma.

CONCLUSION: Rapidly progressing achalasia accompanied by unintentional weight loss is often due to secondary processes. Without controlling for symptoms, 1.5% of patients diagnosed with achalasia were found to be due to neoplasia. When infiltrative malignancies have been ruled out, imaging of the chest, abdomen, and pelvis should be considered to rule out paraneoplastic syndrome from undiagnosed malignancies.

RETURN OF A FOE OR NEW ADVERSARY?: A CASE OF RECURRENT JAUNDICE AND LIVER INJURY IN A 28-YEAR-OLD FEMALE

Jesse Solomon¹; Hugo Kaneku¹; Anna K. Donovan². ¹University of Pittsburgh Medical Center, Pittsburgh, PA; ²University of Pittsburgh School of Medicine, Pittsburgh, PA. (Control ID #3180836)

LEARNING OBJECTIVE #1: Be familiar with the clinical presentation of relapsing Hepatitis A Virus (HAV)

LEARNING OBJECTIVE #2: Recognize the limitations of biopsy in distinguishing HAV infection from autoimmune hepatitis

CASE: A 28-year-old female presented with recurrent jaundice. She was diagnosed with acute HAV infection three months prior and had near complete resolution of her symptoms with supportive care. One month prior to her current presentation, she developed severe fatigue, nausea, vomiting, and jaundice. Her medical history included postural orthostatic tachycardia syndrome, obesity status post gastric sleeve, and anxiety. Family history was noncontributory. Initial physical examination was notable for jaundice and generalized abdominal tenderness without peritoneal signs; exam was negative for Murphy's sign, asterixis, caput medusae, or lower extremity edema. Labs were significant for AST 956 IU/L, ALT 455 IU/L, total bilirubin 16.5 mg/dl, albumin 2.5 mg/dl, alkaline phosphatase 88 IU/L, INR 2.4, total IgG 2530, and positive anti-HAV IgM and anti-smooth muscle Ab (ASMA). Abdominal US and CT revealed an unremarkable liver morphology and hepatic vessel flow; however, the liver was noted to be hypoechoic with thickening of the portal venous wall. Differential diagnosis was relapsing HAV vs. autoimmune hepatitis (AIH). A liver biopsy revealed bridging necrosis with a plasmacytic infiltration consistent with a subacute process, such as HAV; however, AIH could not be ruled out. On hospital day 10, the patient became confused and somnolent with worsening coagulopathy. She was transferred to the ICU, where she was treated empirically with high-dose prednisone and plasmapheresis. Family successfully advertised for an altruistic donor on social media resulting in a non-related living donor liver transplant. She was discharged on post-op day 14 with normal mental status and liver function.

IMPACT/DISCUSSION: This case changed our perspective of HAV infection, which is typically self-limiting and without long-term sequelae, and the

difficulty in distinguishing relapsing HAV from AIH. The diagnostic dilemma is further magnified by the differences in managing the two diagnoses.

CONCLUSION: Up to 10% of patients may have clinical or biochemical relapsing course of HAV infection, and fulminant hepatitis occurs in just 1% of cases. Interestingly, HAV infection has been shown to provoke AIH in a minority of patients. Our patient had a recent HAV infection with a concurrently elevated IgG and positive ASMA, raising concern for AIH. Data concordant with relapsing HAV infection include tissue specimen with a subacute pathological process and a lack of response to steroids or plasmapheresis; however, this lack of response may have been an indicator that her liver failure was irreversible. Internists need to consider relapsing HAV and AIH in patients with recent HAV infection who present with recurrent symptoms.

REVENGE OF A FISH: AN UNUSUAL CAUSE OF PERSISTENT ABDOMINAL PAIN IN A 64 YEAR-OLD FEMALE

Ryan Burkholder¹; Hrishikesh Samant². ¹Louisiana State University Health Sciences Center, Shreveport, LA; ²Louisiana State University, Shreveport, LA. (Control ID #3184820)

LEARNING OBJECTIVE #1: Diagnose and treat hepatic abscess due to foreign body implantation

CASE: 64 y.o. female with PMH of hypertension, obesity and GERD presents with 8 days of abdominal pain in right upper quadrant and epigastric region accompanied by nausea, vomiting, fevers and yellow diarrhea. On admission, vital signs were notable for BP 216/90, P 133, RR 18, Temp 102.7. Physical exam showed jaundice but did not appreciate abdominal tenderness or guarding. WBC was 20.2k, total bilirubin 2.4, alkaline phosphatase 114, AST 62, ALT 59 and albumin 2.6. CT of the abdomen was performed showing a 6.9 cm lobulated heterogeneously enhancing fluid lesion within the junction of the right and left hepatic lobes, also noting signs of colitis. Interventional radiology performed percutaneous drainage on day of admission. Abscess cultures returned with alpha hemolytic streptococcus. Due to persistent leukocytosis and repeat abdominal CT which showed persistent fluid collection, a drain revision was performed 5 days later, and noticed a 2.1 cm radiopaque foreign body resembling a fish bone noted at the level of the falciform fissure/gastro hepatic ligament. Gastroenterology was consulted EGD was done at this time in attempts of retrieval yet there was no visualization of the fishbone from the antrum of the stomach. Surgical team was consulted yet decided against performing retrieval via laparotomy due to clinical improvement in patient. Repeat CT prior to discharge showed subcapsular hepatic collection (2x6.5 cm) involving segments 2/3, distal gastric mural thickening and perigastric inflammatory changes. Patient improved clinically, leukocytosis decreased to 8.9K, and blood cultures remained negative. Patient was discharged on extended course of ceftriaxone and intravenous metronidazole.

IMPACT/DISCUSSION: Gastrointestinal perforations have been reported in less than 1% of patients with foreign body ingestions with most common sites of perforation of the gut being the stomach and duodenum. Patients have non-specific complaints including abdominal pain, fever vomiting, weight loss and/or anorexia as response to infection and abscess formation. History may be unhelpful and patients rarely recall episode of ingestion, and it may be weeks to months prior to presenting complaints. While plain x-rays are only 32% sensitive in detecting foreign bodies in upper GI tract, CT imaging is preferred technique for diagnosis.

CONCLUSION: Careful correlation of imaging findings and clinical course should be performed in patients with unexplained hepatic abscess formation. As demonstrated in our patient, endoscopy is only helpful when performed early, before migration and mucosal healing of the GI tract. We treated this patient with routine drainage and antibiotics. Our clinical report is similar to

previous episodes reported in previous literature, although in our case the decision was made to leave foreign body intact due to clinical improvement.

REVERSAL OF RIGHT VENTRICULAR FAILURE WITH PACEMAKER LEAD EXTRACTION

LU CHEN¹; Uta Guo³; PARAG MEHTA². ¹NEW YORK PRESBYTERIAN - BROOKLYN METHODIST HOSPITAL, Brooklyn, NY; ²NewYork-Presbyterian BMH Hospital, Brooklyn, NY; ³SUNRISE GME CONSORTIUM, LAS VEGAS, NV. (Control ID #3186224)

LEARNING OBJECTIVE #1: Recognize and treat tricuspid regurgitation (TR) induced right ventricular (RV) failure.

CASE: A 73-year-old female with a medical history of atrial fibrillation (AF), and hypertension presented to the emergency department with gradually worsening dyspnea on exertion, abdominal distension, and lower extremity swelling. For the past year, the patient had decreased exercise tolerance, limited by chest pressure and dyspnea. The chest pressure starts after ambulating one block and is relieved by rest. She was started on furosemide and reported moderate alleviation of her symptoms. In 2008, the patient underwent two unsuccessful ablations for long-standing AF and ultimately received atrioventricular nodal ablation with dual chamber permanent pacemaker (PPM) implantation. On admission, vital signs were stable except for tachypnea at 22 breaths per minute. She had significant jugular venous distension, lower extremity edema up to her thighs, but no crackles on pulmonary exam. Laboratory studies showed elevated brain natriuretic peptide (BNP) at 2980 pg/mL, hyperbilirubinemia at 1.3mg/dL, and thrombocytopenia of 55,000/uL. Chest radiography showed cardiomegaly, an implanted PPM, and no pulmonary congestion. Patient was started on high doses of intravenous furosemide. Following successful diuresis, an echocardiogram (TTE) showed left ventricular ejection fraction (LVEF) of 50%, a severely dilated RV with severe systolic dysfunction, and wide open TR with malcoaptation of the valve leaflets. Right heart catheterization demonstrated elevated right-sided filling pressures without elevation in pulmonary arterial pressure or left-sided filling pressures. Liver biopsy confirmed liver cirrhosis due to congestive hepatopathy. PPM lead-induced severe TR leading to congestive hepatopathy with liver cirrhosis was suspected. Patient underwent laser lead extraction and subsequent implantation of a leadless PPM. Within six months, she reported significant improvement in the quality of life with increased exercise tolerance with no chest pain, shortness of breath or lower extremity edema. Repeat TTE showed moderate RV dilatation with mild dysfunction, and improved tricuspid leaflets coaptation.

IMPACT/DISCUSSION: TR is a recognized complication of transvenous PPM or defibrillator placement as RV lead can impinge the tricuspid leaflet. This case illustrates the importance of a thorough workup for a patient presenting with predominantly right heart failure. Previous experiences with RV lead extraction have shown mixed results on the improvement of RV dysfunction and TR. This can likely be attributed to patient selection. Leadless PPM is a viable option for patients with TR secondary to lead impingement of the tricuspid valve.

CONCLUSION: We present a case of severe TR, and RV failure successfully managed with RV lead extraction. The root of our success likely lies within careful patient selection for lead removal through thorough work-up and excluding alternative causes of TR and RV dysfunction.

REVISITING AN ATYPICAL LYMPHOCYTIC COLITIS: LESSONS FROM A PATIENT WITH CHRONIC DIARRHEA

Harry J. Han¹; Adam Tapley^{1, 3}; Rabih Geha^{1, 2}. ¹University of California San

Francisco, San Francisco, CA; ²San Francisco Veterans Affairs Medical Center, San Francisco, CA; ³School of Medicine, University of California San Francisco, San Francisco, CA. (Control ID #3178080)

LEARNING OBJECTIVE #1: Recognize malignancy as a rare cause for chronic diarrhea

LEARNING OBJECTIVE #2: Appreciate the challenges in diagnosing intestinal T-cell lymphoma.

CASE: A 76 year-old gentleman with schizophrenia and a 60-pack year tobacco history presented with 10 weeks of profuse diarrhea. Stools were rarely formed, but not oily, greasy, malodorous and without melena or hematochezia. There was associated unintentional weight loss, tenesmus, and nocturnal awakening. Review of systems was otherwise negative. Physical exam was notable for 13-pound weight loss over 3 months and hyperactive bowel sounds. Basic labs were normal as was a CT abdomen/pelvis with contrast. Stool osmolar gap was 130 and stool PCR was positive for Giardia. The patient was treated with a course of metronidazole. Despite antibiotic therapy, the patient had persistent diarrhea and an additional 20-pound weight loss over 2 months. EGD/Colonoscopy showed a diffuse patchy colitis and biopsies were interpreted as diagnostic of lymphocytic colitis. The patient's profound weight loss prompted a reexamination of the colonic biopsies, which revealed a more exuberant lymphocyte response than expected for classic lymphocytic colitis and atypical-appearing intraepithelial lymphocytes (IEL). Further immunohistochemical and genetic studies demonstrated a natural killer (NK) and T-cell mononuclear cell infiltrate in the colonic mucosa with positive T-cell receptor clonality. The patient was diagnosed with monomorphic epitheliotrophic intestinal T-cell lymphoma (MEITL).

IMPACT/DISCUSSION: MEITL is an aggressive tumor accounting for less than 5% of peripheral T-cell lymphomas. Unlike Type I enteropathy-associated T-cell lymphomas (EATL), MEITL (previously known as Type II EATL) is not associated with celiac disease. MEITL is a challenging diagnosis given its rarity, non-specific symptoms, heterogeneous endoscopic appearance, and mixed histopathology. Patients present with non-specific symptoms, including chronic diarrhea, abdominal pain, and weight loss. 50% of patients are diagnosed after acute abdominal complications (e.g. bowel perforation or obstruction). These tumors are heterogeneous in appearance and can present as normal appearing mucosa, ulcerations, masses, and/or strictures. Histologically, there is an overabundance of mucosal IELs occasionally associated with crypt hyperplasia and villous atrophy. As illustrated in this case, the increased IELs can be mistaken for lymphocytic colitis. Biopsy reanalysis is warranted if the clinical syndrome is inconsistent with microscopic colitis. Median survival for MEITL is <1 year and standard of care remains undetermined.

CONCLUSION: MEITL is a rare peripheral T-cell lymphoma that is challenging to diagnose due to non-specific presenting symptoms, heterogeneous macroscopic appearance, and complex histopathology. In patients with chronic diarrhea with associated alarm symptoms (fevers, bleeding, significant weight loss) and lymphocytic colitis, intestinal lymphomas should be considered in the differential diagnosis.

RHABDOMYOLYSIS FOLLOWING SYNTHETIC CANNABINOID USE: "MOJO"

Hanyuan Shi; Elle Wade; Sarah Cossich. Tulane University School of Medicine, New Orleans, LA. (Control ID #3184297)

LEARNING OBJECTIVE #1: Demonstrate the detrimental effects of synthetic cannabinoids.

LEARNING OBJECTIVE #2: Understand rhabdomyolysis as a life-threatening side effect of synthetic cannabinoids

CASE: A 22-year old man with a history of depression, schizoaffective disorder, lead exposure, and seizures initially presented to the hospital with altered mental status. Collateral information reported concern for seizure activity with bilateral lower extremity muscle jerking. In the emergency room, the patient was agitated and aggressive. Labs were significant for WBC 14.3, lactate of 2.6, BUN 30, Cr 1.21. Ammonia 89. Liver function tests were elevated with AST 592, ALT 135, normal alkaline phosphatase 87, with normal bilirubin 1. Urine drug screen returned positive for cannabinoid. The patient's initial creatinine kinase (CK) was 49,360. Urinalysis showed >10.0 mg/dl of blood but <5 RBCs. He was started on 250 ml / hr of lactated ringers for treatment of rhabdomyolysis. Spot EEG showed no ongoing seizures or status epilepticus. Over the next six days, fluids were continued and his CK trended down to <5000. He later reported a use of "K2".

IMPACT/DISCUSSION: Synthetic cannabinoids have been used more frequently as recreational drugs. Common street names include "Spice", "K2", "Yucatan Fire", "Skunk", or "Mojo". Often, users of synthetic marijuana report a more intense high than the natural formulation. Alarmingly, there is an increasing population of teenagers and young adults using these compounds, along with increasing reports of complications including acute kidney injury and nephrotoxicity. The pathogenesis of AKI is unknown but hypothesized that synthetic marijuana often contains non-cannabinoid contaminants that are nephrotoxic. Only a few reports note rhabdomyolysis following synthetic cannabinoid use, including one which details renal failure requiring dialysis. "K2" is a deadly synthetic stimulant that as demonstrated here, can lead to seizures, severe agitation, and acute rhabdomyolysis. This case demonstrates the neurogenic and nephrogenic sequelae of ingestion. Early studies have been released demonstrating significant impairment of behavior and judgment by users; however there has not been many published literature on the consequences of overdose. Liberal regulations of synthetic cannabinoids have allowed for increased availability of these substances. Companies that manufacture "K2" operate in clandestine fashion to avoid detection by the FDA.

CONCLUSION: Internists may encounter an increasing number of cases of substance abuse. This case demonstrates the availability and detrimental effects of synthetic cannabinoids.

RHABDOMYOLYSIS: A RARE HERALD SIGN OF HYPERALDOSTERONISM

Chester J. Kao¹; Jenny Van Kirk². ¹Duke University, Durham, NC; ²Duke University Hospital, Durham, NC. (Control ID #3175921)

LEARNING OBJECTIVE #1: Recognize hyperaldosteronism as a cause of rhabdomyolysis

LEARNING OBJECTIVE #2: Diagnose primary hyperaldosteronism

CASE: A 47 year old male with a history of hypertension, chronic hypokalemia, and chronic kidney disease stage III presented with a one week history of non-exertional, atypical chest pain without radiation. His last cardiac catheterization was five years prior and was normal. Exam was unremarkable except for hypertension to 160/90. Labs were notable for potassium (K) to 2.9, creatine 2.4, bicarbonate 27, and CK 2100. Acute coronary syndrome (ACS) workup was negative, and EKG demonstrated Q waves in V1 and V3 without ST changes. Medications included carvedilol, amlodipine, losartan, and prior K supplements. Family history was notable for hypertension and hypokalemia. Despite aggressive repletion with over 200 mEq of K chloride in 48 hours, the patient's potassium remained low at 2.5 to 2.7. He denied any muscle cramps or hematuria, and his chest pain resolved with normalizing CK. Primary hyperaldosteronism was suspected due to the refractory hypokalemia and hypertension. Thus, losartan was switched to spironolactone 25 mg daily. Aldosterone and renin levels were sent but did not result prior to discharge.

Due to patient preference, he was discharged with close follow-up. Outpatient endocrinology workup showed elevated plasma aldosterone concentration (PAC = 27) to plasma renin activity (PRA = 0.7) > 15. Saline infusion test and abdominal computed tomography are pending.

IMPACT/DISCUSSION: Primary aldosteronism (PA) is a rare disease affecting 1% of hypertensive patients. PA is the most frequent cause of secondary arterial hypertension, and it is often due to aldosterone-producing adenomas or adrenal hyperplasia. PA classically presents with hypertension, hypokalemia, and metabolic alkalosis. Hypokalemia can commonly lead to muscle weakness, but, in rare cases, it can lead to rhabdomyolysis. In the literature, there are only a few cases of rhabdomyolysis as the presenting symptom of PA. In our patient, the rhabdomyolysis was incidentally noted on labwork in the setting of atypical chest pain without muscle weakness or pain. Frank rhabdomyolysis often does not occur unless the serum K levels are below 2.0 mEq/L. To prevent further progression of symptoms, large amounts of K supplementation are necessary as well initiation of an anti-aldosterone receptor drug including spironolactone or eplerenone. PAC/PRA > 15 is highly suggestive of PA, but diagnosis should be confirmed with aldosterone suppression with sodium loading or saline infusion test. In addition, imaging is needed for evaluating the cause of PA.

CONCLUSION: Rhabdomyolysis may not present with typical symptoms of muscle weakness or pain, so there should be a high suspicion for PA if rhabdomyolysis occurs in the setting of chronic hypokalemia and medication refractory hypertension. In these cases, initiation of an anti-aldosterone receptor drug can help with supplementation-resistant hypokalemia.

RHINOVIRUS INFECTION A TRIGGER OF SEVERE HYponatremia

omar kousa; Dana Awad; abdallah qasim; Bailey Waters; Mohsin Mirza. Creighton University, Omaha, NE. (Control ID #3186065)

LEARNING OBJECTIVE #1: Recognize the role of rhinovirus in causing hyponatremia.

LEARNING OBJECTIVE #2: Present hyponatremia as a poor prognostic factor in rhinovirus infection in adults.

CASE: A 52-year-old Caucasian woman with a medical history of hypertension on Lisinopril-Hydrochlorothiazide and anxiety on Sertraline, presented with shortness of breath, productive cough, fatigue, confusion and diarrhea of few days. On physical exam; she was mildly distressed and looked dehydrated. Vital signs were significant for a blood pressure of 100/70 mmHg, Heart rate of 110/minute, respiratory rate of 35/minute, a temperature of 100 F and oxygen (O₂) saturation of 85% requiring 2 Liters (L) of O₂ via nasal cannula. Chest exam revealed diffuse bronchial breathing sounds. Chest X-ray showed consolidation consistent with pneumonia. Metabolic profile was significant for hyponatremia at 101 mmol/L (normal is 135-145). She was admitted to the intensive care unit as a case of severe sepsis with severe hyponatremia. Further work-up showed low urine sodium at 5 mmol/L, elevated urine osmolality at 736 mOsm/kg, along with low serum osmolality at 230 mOsm/ kg which supported a diagnosis of Syndrome of Inappropriate Anti-Diuretic Hormone Secretion (SIADH) as a cause of her hyponatremia. Renal team was consulted and she was started on hypertonic saline and levofloxacin, in addition to holding all home medications. She was subsequently intubated due to increased work of breathing. Respiratory pathogen screen came positive for Rhinovirus. Her severe hyponatremia was corrected slowly, her mental status improved and she was eventually extubated.

IMPACT/DISCUSSION: The patient had been taking hydrochlorothiazide and sertraline), for many years. sodium six months prior to was normal. We think her severe hyponatremia multifactorial, with Rhinovirus infection being

the major contributing factor. Previous studies have shown that respiratory tract infections can induce hyponatremia due to an unknown mechanism, most likely SIADH. When rhinovirus present with hyponatremia, it is associated with a worse course. Multiple previous studies showed the link between rhinovirus and hyponatremia in the pediatric population, but no sufficient data has been reported for the adult population.

CONCLUSION: Rhinovirus can induce severe hyponatremia in high risk patients and low serum sodium at initial presentation is associated with worse clinical outcome in adults. However, larger studies are needed to elucidate the exact mechanism.

RING AROUND THE ENHANCING LESIONS

Justine Phifer; Andrea Porrovecchio. Montefiore Medical Center, Bronx, NY. (Control ID #3186330)

LEARNING OBJECTIVE #1: Identify etiologies of ring enhancing lesions in brain

LEARNING OBJECTIVE #2: Understand legal and ethical consent process for obtaining HIV testing

CASE: A 60 year old woman from Ghana with unknown HIV status presented with altered mental status of four days and weight loss with trouble ambulating of a few months. On presentation patient was inattentive, disoriented, and had left upper and lower extremity weakness. CT head revealed mass effect in right temporal lobe and right caudate head and a MRI brain revealed 30 predominantly ring enhancing lesions in cerebrum/ cerebellum. Patient was started on dexamethasone given the mass effect of her brain lesions and treated empirically for toxoplasmosis given high clinical suspicion. CSF was eventually positive for toxoplasmosis and HTLV. Although initially unable to provide consent for HIV testing due to her altered mental status, she was eventually able to provide informed consent and was found to have new diagnosis of AIDS with a CD4 count of 29. Given her AIDS status and unusually high number of lesions on MRI, she was thought to potentially have concurrent CNS lymphoma. Brain biopsy was deferred until full malignancy workup had been performed and follow up imaging had been obtained to assess for improvement in lesions with toxoplasmosis treatment.

IMPACT/DISCUSSION: The differential for ring enhancing lesions in the brain may be narrowed based on degree of patient's immunosuppression as well as whether lesions cause mass effect. In immunocompetent patients as well as those with CD4 count >500, benign and malignant brain tumors and metastases predominate. Moderately immunosuppressed patients or HIV positive patients with CD4 count 200-500 rarely present with focal brain lesions. Severely immunosuppressed patients and those with CD4<200 most likely have an opportunistic infection or AIDS-associated tumors. CNS lesions with mass effect are most often caused by Toxoplasma encephalitis and primary CNS lymphoma in the developed world, and in developing world, tuberculomas. One study of HIV positive persons who underwent brain biopsy for the diagnosis of focal CNS lesions revealed that 6 percent had more than one etiology of a lesion. Laws regarding HIV testing differs amongst states, but in New York, verbal consent must be obtained prior to testing. The law mandates that all patients are offered HIV testing (an "opt-out" program). Certain exceptions do exist, such as for newborns, when testing blood or organs for donation, for instances of occupational exposure, certain cases of indicted sex offenders, etc. While HIV status would have possibly helped narrow the differential in our patient, legal and ethical considerations must be made and under most circumstances, patients have the right to decline testing. **CONCLUSION:** Toxoplasmosis should be empirically treated if clinical suspicion is high enough, even if HIV status is unknown. In some states,

HIV testing may only be performed after verbal consent has been obtained, despite clinical scenario

RISING PSA, FALLING FIBRINOGEN: A POTENTIAL PERIL OF METASTATIC PROSTATE CANCER

Clare Cene-Kush; Sunmin Park; Alfred Shoukry. UPMC, Pittsburgh, PA. (Control ID #3181524)

LEARNING OBJECTIVE #1: Recognize disseminated intravascular coagulation (DIC) with excessive fibrinolysis as a potential complication of metastatic prostate cancer

LEARNING OBJECTIVE #2: Describe the management of acute DIC in the setting of prostate cancer

CASE: A 58-year-old man presented with unintentional 25-lb weight loss and a prostate-specific antigen (PSA) elevation to 602.4 ng/mL. Imaging revealed an enlarged prostate and widespread metastatic osseous disease involving the pelvis, thoracolumbar spine and lower ribs with diagnosis of prostate carcinoma confirmed by iliac lymph node biopsy. He was admitted to our inpatient medicine service for worsening anemia, recurrent epistaxis, spontaneous ecchymosis, hematuria and hemoptysis. Physical exam revealed oozing from bilateral knee abrasions and a large ecchymosis over the right buttock. Laboratories were significant for hemoglobin 6.9 g/dL, platelets $108 \times 10^9/L$, fibrinogen 70 mg/dL, haptoglobin < 30 mg/dL, lactate dehydrogenase 248 IU/L, D-dimer > 20 ug/mL, positive fibrin degradation products, prothrombin time (PT) 20.2 seconds, partial thromboplastin time (PTT) 45.2 seconds and INR 1.8. His deranged coagulation profile persisted, with fibrinogen levels declining to a nadir of 56 mg/dL despite supportive transfusions with packed red blood cells and cryoprecipitate, but began to improve six days after initiation of hormonal treatment of his metastatic prostate cancer with bicalutamide and leuproide.

IMPACT/DISCUSSION: This case highlights the need for internists to recognize DIC with excessive fibrinolysis as a potential complication or presenting symptom of prostate cancer. Treatment includes supportive transfusions and urgent initiation of complete androgen blockade or deprivation. In this case, correction of coagulopathy and reduction in spontaneous bleeding occurred within one week of initiation of treatment for his prostate cancer.

CONCLUSION: No single test is diagnostic of DIC; instead it requires recognition of a predisposing clinical scenario combined with characteristic laboratory derangements. Treatment is aimed at reversing the underlying cause. In patients with solid tumors, DIC is usually a chronic, compensated and asymptomatic laboratory phenomenon marked by thrombocytopenia with prolonged PT and PTT. A moderate degree of fibrinolysis is often indicated by an elevated D-dimer, but fibrinogen levels themselves are typically normal. However, a form of acute DIC with prominent fibrinolysis has been described in several case reports as occurring more frequently in prostate cancer, making it unique among the solid tumors associated with this consumptive coagulopathy. It has also been suggested that excessive fibrin degradation portends a poorer prognosis with greater risk for catastrophic bleeding. In this case, our patient's DIC and spontaneous bleeding symptoms began to resolve shortly after initiation of prostate cancer treatment despite a significant degree of fibrinolysis on presentation.

RITUXIMAB IN SYSTEMIC LUPUS ERYTHEMATOSUS FRIEND OR FOE

Shane Murray¹; Gustavo Contreras Anez¹; Ana B Arevalo¹; Yousaf Ali^{1, 2}.

¹Mount Sinai St Luke's - West, New York, NY; ²Mount Sinai Hospital, New York, NY. (Control ID #3185917)

LEARNING OBJECTIVE #1: Recognize rituximab as a cause of neutropenia in systemic lupus erythematosus

CASE: 47-year-old Female with a past medical history of systemic lupus erythematosus (SLE) presented to the Emergency department with a three-day history chest pain. She described a sharp pain, exacerbated by lying flat associated with chills, muscle ache and sore throat. No rash, joint pain, headache or oral ulcers were noted. Medications included mycophenolate mofetil 2g daily, prednisone 1mg daily and rituximab (RTX) given as a weekly infusion for two weeks every two months. Physical Exam was remarkable for a cardiac friction rub. ECG demonstrated diffuse PR depressions. Initial Laboratory studies revealed troponinemia (peak 2.1ng/ml) and neutropenia with an absolute neutrophil count of zero. Chest radiograph was unremarkable. Treatment was begun with high dose oral corticosteroids and broad-spectrum antibiotics. Initial transthoracic echocardiogram was unrevealing but subsequent cardiac MRI confirmed myopericarditis. Examination of peripheral blood smear noted bands and occasional myelocytes. Laboratory testing for extractable nuclear antigens, including double stranded DNA was negative. Complement levels were normal. Bacterial, viral and fungal testing was unrevealing. Neutrophil counts improved and patient was discharged with a Prednisone taper. Outpatient testing off the drug resulted in normalization of neutrophil counts.

IMPACT/DISCUSSION: RTX has gained popularity in recent years as an off-label therapy for refractory SLE. Studies on the efficacy of the drug have yielded conflicting results and its role as a treatment in SLE remains controversial. Treatment duration is poorly defined and uncertainty exists over the safety and efficacy of redosing. Typically, SLE patients receive between two and four doses as therapy. Retreatment is only considered in those who responded and show signs of disease flare. Here we demonstrate a case of RTX infusions given under a modified protocol at an outside institution which may have contributed to a case of late onset neutropenia (LON). RTX is increasingly recognised as a cause of LON. Recent literature suggests a higher occurrence of LON in SLE patients compared to others treated with the drug. High cumulative doses, as in this case, have also been linked to increased rates of LON. While it is difficult to exclude lupus or infection as contributing factors, we felt that RTX was the likely culprit due to the relatively high dose and improvement in neutropenia upon cessation of the drug. Providers should remain cautious when prescribing RTX in SLE patients, record cumulative doses and monitor patients frequently for neutrophil count and signs of infection.

CONCLUSION: Safety and efficacy of RTX in SLE is poorly defined and requires further research. RTX related LON may be more prevalent in SLE patients and high cumulative doses may increase risk. Patients should be monitored closely for neutrophil counts and signs of infection after treatment.

ROLE OF C-INHIBITOR TREATMENT IN GLIOBLASTOMA MULTIFORME WITH REFRACTORY EDEMA

Gillian R. Naro; Nicholas Noverati; Timothy Craig. Penn State College of Medicine, Hershey, PA. (Control ID #3165785)

LEARNING OBJECTIVE #1: Recognize the role of bradykinin in clinical complications of Glioblastoma Multiforme (GBM).

LEARNING OBJECTIVE #2: Discuss the utility of immune-targeted therapy in glioblastoma associated edema through a clinical vignette.

CASE: A 49-year-old male whose medical history is significant only for GBM diagnosed on 9/26/2016, sought treatment for his cerebral edema and angioedema in 3/2018. His disease progressed significantly despite two craniotomy resections, adjuvant chemotherapy, and radiation. On 1/31/2018 he developed angioedema of the pharynx and intermittent swelling of various

cutaneous sites that was refractory to antihistamines, as well as progressive cerebral edema that did not respond to high dose corticosteroids. Despite a normal C1q, C4 and C1-inhibitor protein and function, C1-inhibitor treatment was started on 3/12/18 at 20 units/kg IV twice weekly, based on literature suggesting that edema may be bradykinin generated. The patient subsequently reported significant improvement in mental status. An MRI on 5/18/2018 confirmed reduced cerebral edema and midline shift after two months of treatment. He has since been maintained on C1-inhibitor infusions twice a week.

IMPACT/DISCUSSION: GBM is one of the most common adult primary brain tumors. It has a poor prognosis with 5-year survival after radiation and temozolamide chemotherapy at 9.8%. It is thought that mesenchymal stem cells influence GBM invasiveness through cross-talk pathways that lead to an upregulation of bradykinin receptors. Further, bradykinin is also involved in the formation of vasogenic edema by disrupting the blood-brain barrier. Edema adds to the tumor's mass effect as it invades surrounding parenchyma, ultimately increasing intracranial pressure and contributing to overall morbidity and mortality. Treatment of cerebral edema usually entails corticosteroid therapy; however, if unresponsive, there are few additional medical therapies available. Recent research supports bradykinin's role in both tumor invasion and vasogenic edema, has led to interest in the usefulness of C1-esterase inhibitor as a potential therapy to decrease the amount of bradykinin generated by malignant GBM cells. Our case discusses a patient with advanced GBM who had diffuse edema refractory to steroid therapy, and responded well to recombinant C1-inhibitor. This success may help inspire future trials to explore the utility of this drug as an addition to the arsenal of available treatment modalities for highly aggressive glioblastomas.

CONCLUSION: •GBM is an aggressive tumor that uses bradykinin pathways to advance its borders and distort the blood-brain barrier to create surrounding edema, which can worsen morbidity and mortality. •C1-inhibitor works by inhibiting the contact activation system and thus reducing bradykinin levels available to the tumor. •In a patient with vasogenic edema of the CNS that is refractory to other first-line therapies, C1-inhibitor may be a safe and effective option.

ROOTING OUT A CURIOUS GARDNER'S RASH

Justin B. Roy¹; Melissa Yacur²; Ami DeWaters³. ¹Penn State Hershey, Hummelstown, PA; ²Hershey Medical Center, Hershey, PA; ³Penn State Hershey Medical Center, Hershey, PA. (Control ID #3185468)

LEARNING OBJECTIVE #1: Discuss the clinical signs, symptoms and diagnosis of disseminated nocardiosis.

LEARNING OBJECTIVE #2: Describe the risk factors for nocardiosis.

CASE: A 70 year old man with a history of Hodgkin's lymphoma and Follicular lymphoma treated with chemotherapy one year prior, presented to the hospital due to diffuse subcutaneous nodules, rash and weakness. He had developed an erythematous, mildly painful rash that began on his back six months prior to admission, which progressed to disseminated subcutaneous nodules. He was diagnosed with dermatomyositis and was managed as an outpatient with high intensity glucocorticoids. A biopsy was obtained due to concerns for recurrent lymphoma, but returned with only neutrophils. A follow-up PET-CT scan showed innumerable lesions in the lungs, abdomen, diffuse subcutaneous and muscle tissues. A neck lesion was biopsied and cultured, and returned positive for possible *actinomycetes* infection, at which time the patient was referred to the hospital. He had no other pertinent medical, surgical, family or social history apart from the fact that he had been an avid gardener up until six months ago at the onset of his symptoms. On admission, a repeat culture of a biopsy of a nodule in the neck was obtained

and sent for additional testing, including *nocardia* cultures. When his cultures returned positive for *nocardia veterana*, he was immediately placed on intravenous trimethoprim-sulfamethoxazole. However, his clinical condition continued to deteriorate and he eventually succumbed to his infection one month after the diagnosis of disseminated nocardiosis was made.

IMPACT/DISCUSSION: Nocardiosis is often an elusive diagnosis. The usual hallmarks of infection, such as fever and leukocytosis, can be lacking, particularly when the infection is limited to the skin prior to pulmonary involvement. Subcutaneous, pulmonary, and brain nodules, which have a neutrophil predominance on gram stain, are the most common sign. Cultures (blood/fluid), which require a fourteen day incubation period specifically for *nocardia*, are necessary for diagnosis. Early diagnosis is critical, since disseminated nocardiosis has mortality rates as high as 64% without appropriate treatment. Prompt initiation of therapy has been associated with reduction in mortality to 10%. Therefore, clinicians need to maintain a high degree of suspicion to diagnose patients quickly. Identifying risk factors for nocardiosis may help with early diagnosis. Risk factors include immunocompromised states, such as a history of HIV infection, lymphoma, and chronic treatment with high dose glucocorticoids. This patient had both of the later two risk factors. In the presence of subcutaneous nodules, attention to these risk factors may allow for earlier diagnosis and initiation of appropriate management for nocardiosis.

CONCLUSION: Clinicians should be able to describe the risk factors and common presentation of disseminated nocardiosis in order to prevent delays in diagnosis that significantly raise mortality.

ROSAI DORFMAN SYNDROME AS AN UNCOMMON PRESENTATION OF SINUS HISTIOCYTOSIS.

Merza Nooraldin¹; Assad Mohammedzein²; Mazin Saadaldin¹; Omar Salh¹; ahmed qasim³; Kaylee J. Shepherd⁴. ¹tuhsc, Amarillo, TX; ²Texas Tech University Health Science Center, Amarillo, TX; ³Texas Tech University Health sciences, Amarillo, TX; ⁴Texas Tech University Health Sciences Center, Amarillo, TX. (Control ID #3184561)

LEARNING OBJECTIVE #1: 1. Recognize Rosai-Dorfman syndrome as a cause of generalized lymphadenopathy 2. Learn the available treatment options of this benign rare disease

CASE: A 77-year-old male with medical history of chronic obstructive pulmonary disease on home oxygen, diabetes, hypertension and heart failure with reduced ejection fraction presented with 1 day of worsening shortness of breath, dry cough, orthopnea and lower extremity swelling. Other review of systems unremarkable. Physical exam notable for blood pressure 172/92 mmHg, oxygen saturation 96% on 2 L nasal cannula, labored breathing, decreased breath sounds in right lung base, bibasilar crackles, pitting edema in lower extremities up to abdomen, and soft and nontender bilateral cervical, axillary, and inguinal lymphadenopathy. Laboratory studies remarkable for eosinophilia 1.1 (0-0.2 10x3/ul), albumin 2.2 g/dL, LDH 311 UI/L (87-241), CRP 12.9 mg/l (0-2.9) BNP 1000 pg/ml (0-450), D Dimer 1.8 ng/l (0.19-0.49) with ABG consistent with acute respiratory acidosis and hypoxemia. Chest x-ray with pulmonary congestion and EKG with rate controlled atrial fibrillation. Transthoracic echocardiogram with preserved ejection fraction, grade 1 diastolic dysfunction, and RVSP 60-70 mmHg. CT pulmonary angiogram revealed right lower lobe subsegmental pulmonary embolism, right pleural effusion, and extensive cervical, axillary, and prevascular adenopathy. CT abdomen was obtained which revealed further lymphadenopathy. Pleural fluid analysis was transudative, but had predominant lymphocytes (negative cytology) with reactive mesothelial cells, histiocytes, and lymphocytes. Excisional biopsy of right groin lymph node showed central

fatty replacement and fibrosis with sinus histiocytosis without significant cortical hyperplasia. There was no evidence of lymphoma or metastatic malignancy.

IMPACT/DISCUSSION: Besides his acute issue for respiratory failure which was multifactorial, our patient had incidental diffuse soft nontender lymphadenopathy with sinus histiocytosis. Sinus histiocytosis itself is a common benign problem often seen as a reaction to infectious or inflammatory process. When accompanied by diffuse bulky lymphadenopathy, which is rare, it's called sinus histiocytosis with massive lymphadenopathy (SHML) or Rosai-Dorfman syndrome. It's often associated with chronic infections or autoimmune disease which our patient had no evidence. Around 40% of these patient has extranodal manifestation with involvement of the skin, eyes, respiratory tract and CNS. Twenty percent of patients do experience spontaneous resolution hence observation is recommended in most. Alternatively, chemotherapy, radiotherapy or surgery can be considered depending on the extent of the disease.

CONCLUSION: Rosai-Dorfman disease, or SHML, is a disease of benign histiocytic proliferation of unknown etiology. Patients are often asymptomatic, some present with palpable lymphadenopathy, fever or complications from bulky lymph nodes compression.

SACRAL SARCOIDOSIS

Kenneth M. Fifer. Icahn School of Medicine at Mount Sinai, New York, NY. (Control ID #3185026)

LEARNING OBJECTIVE #1: Assess an atypical presentation of low back pain

LEARNING OBJECTIVE #2: Recognize extrapulmonary manifestations of sarcoidosis

CASE: A 49 year old man with no significant past medical history presented with several months of progressive bilateral low back pain. The pain was exacerbated by standing for long periods of time at his job. The pain did not radiate to the abdomen or into either lower extremity. He had no fever, cough, shortness of breath, weight loss, or urinary/bowel incontinence. Review of systems was otherwise negative. Physical exam was significant for moderate point tenderness to palpation over the L3-L4 spine. Laboratory studies were significant for a mild anemia (Hgb 12.6) and leukopenia (WBC 4.0), ESR 24, Vitamin D 17. Serum protein electrophoresis was unremarkable. Plain films of the lumbosacral spine demonstrated lytic-like lesions. CT chest/abdomen/pelvis and MR imaging demonstrated multiple lytic-appearing lesions throughout the lumbar and sacral spine with the appearance of possible metastatic disease or bone marrow replacement process. An enlarged right hilar lymph node was noted. The patient subsequently underwent a CT-guided biopsy which revealed non-necrotizing granulomas. A chest x-ray was unremarkable. Given the back pain, cytopenia and lack of respiratory symptoms, a diagnosis of sarcoidosis of the lumbosacral spine was made.

IMPACT/DISCUSSION: Impact This case demonstrates a valuable lesson in avoiding anchoring bias and evaluating each new piece of clinical data as it is obtained. Each step in the clinical decision making process in this case (physical exam, laboratory testing, imaging, and tissue pathology) had a significant impact on the evolving differential diagnosis. This case adds an unusual presentation of sarcoidosis of the lumbosacral spine to the existing literature. Discussion There are various important extrapulmonary manifestations of sarcoidosis. The musculoskeletal system can be affected in approximately 10% of patients. The most typical musculoskeletal manifestations include acute and chronic polyarthralgias, periarticular soft tissue swelling, and bone resorption. Less commonly, patients can be afflicted with a progressive diffuse, granulomatous myositis. Bone marrow involvement, however, is

relatively uncommon. Case studies as early as 1978 have described sarcoidosis of bone marrow established by histology in the abstract of chest x-ray findings. In one study of 50 patients with sarcoidosis who consented to bone marrow biopsy, 11 were found to have anemia while only 3 of those 11 were found to have bone marrow involvement on biopsy.

CONCLUSION: While extrapulmonary manifestations of sarcoidosis such as musculoskeletal involvement and anemia are relatively common, histological bone marrow involvement is a relatively rare, but important manifestation of systemic sarcoidosis. Providers should consider extrapulmonary involvement in patients with sarcoidosis who present with new, non-pulmonary symptoms

SAVED BY THE SNELL - RECOGNIZING BASILAR SCRAP SYNDROME AS CAUSE OF VERTIGO IN OCCIPITAL CVA

Timothy M. Bober^{1, 2}; Furkan Ertem^{1, 2}; Kristen M. Livesey². ¹UPMC Presbyterian-Shadyside, Pittsburgh, PA; ²University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #3163373)

LEARNING OBJECTIVE #1: Recognize "basilar scrape" syndrome as a cause of vertigo

LEARNING OBJECTIVE #2: Identify importance of visual acuity and visual field and acuity testing in vertigo evaluation

CASE: This was a 72 year-old female with type II diabetes with right eye blindness secondary to proliferative retinopathy, macular degeneration, rheumatoid arthritis, and migraine presenting with a day of frontotemporal headache, dizziness with vertigo, and worsened left-sided vision. She denied diplopia, slurred speech, eye pain, temporal tenderness, jaw claudication, weakness, numbness, chest pain, or palpitations. Admission vitals were notable for hypertension to 168/90 and heart rate of 68 with regular rhythm. Neurology evaluated the patient and, with a normal Dix-Hallpike and neurological exam, recommended head imaging. Admission exam performed by the medical team showed visual acuity of 20/200 (baseline 20/40) in her left eye and 20/800 (baseline 20/100) in her right eye. Tilting her head to the left to see the Snellen chart, the patient was found to have left homonymous hemianopsia with neglect. Differential included occipital stroke, posterior reversible encephalopathy syndrome, cerebral venous thrombosis, central retinal vein occlusion, and giant cell arteritis. A non-contrasted CT Head was negative. A contrasted MRI showed acute right occipital lobe infarct. Transthoracic echo showed mild atrial enlargement. When stable, patient was discharged and with maintained left sided visual deficit. Holter monitoring revealed normal sinus rhythm with rare ectopy.

IMPACT/DISCUSSION: This case shows the value of comprehensive visual testing in evaluating a patient with vertigo, which can reflect changes in vision, vestibular input, or proprioception. Visual testing localizes lesions and informs further imaging, which is not recommended with dizziness without focal signs.¹

CONCLUSION: The evaluation of vertigo includes focused history and neurological examination to differentiate peripheral and central causes.¹ Physicians report "CN II-XII intact" in documentation, but visual testing is often omitted. This exam helped the medical team to provide a more timely diagnosis. This patient's vertigo was attributed to "basilar scrape syndrome" due to transient vertebrobasilar ischemia from an embolus.² Diagnosis warrants evaluation for arrhythmia or cardiomyopathy.³ References: 1. Muncie, H. L., Sirmans, S. M., & James, E. (2017). Dizziness: Approach to Evaluation and Management. *American family physician*, 95(3), 154-162. 2. Koroshetz, W. J., & González, R. G. (2006). Causes of ischemic stroke. In *Acute Ischemic Stroke* (pp. 27-40). Springer, Berlin, Heidelberg. 3. Kamel, H., & Healey, J. S. (2017). Cardioembolic stroke. *Circulation research*, 120(3), 514-526.

SCRATCHING YOUR HEAD OVER CAT SCRATCH DISEASE

Cindy Nguyen; Ashley Busuttil; Chandra Smart. UCLA, Los Angeles, CA.
(Control ID #3177541)

LEARNING OBJECTIVE #1: Recognize an atypical presentation of Cat Scratch Disease in an elderly patient

CASE: A 71 year old woman presented with fever, fatigue, rigors and confusion. Exam was notable for T 102.7F, 94% RA, encephalopathy and bibasilar rales. WBC was 9.8. There was no pulmonary consolidation and initial infectious work up was negative. She was empirically treated for presumed atypical pneumonia; however, she continued to have fevers. She had cats at home that do not scratch or bite. She noted a right forearm pustule that was intermittently purulent and crusted over the past two months. Imaging revealed 10-15 hypodense hepatosplenic lesions and abdominal lymphadenopathy. TTE and TEE were normal. A liver biopsy and punch biopsy of the arm pustule were non-diagnostic. Although initial *Bartonella* serologies and PCR were negative, given the clinical findings of fever, lymphadenopathy, hepatosplenic involvement and cat exposures at home, the patient was treated for presumptive Bartonellosis. She clinically improved and serial serologies (*Bartonella* IgG) became positive with a titer of 1:256 at 4 weeks. The hepatosplenic lesions and lymphadenopathy decreased in size after four weeks of azithromycin. The positive convalescent serologies and clinical improvement with antibiotics confirmed the diagnosis of Cat Scratch Disease.

IMPACT/DISCUSSION: Cat Scratch Disease commonly presents in children with self-limited regional lymphadenopathy. Elderly patients are more likely to present atypically with endocarditis, encephalitis, and fever of unknown origin. Due to a lower suspicion for Cat Scratch Disease in older patients, the diagnosis is often delayed. A diagnosis is usually made clinically with a history of cat exposure. Serological testing may be performed, however it has poor sensitivity and specificity. IgG titers 1:256 or more suggests active or recent infection. Biopsies are not routinely performed for diagnosis, but the Warthin-Starry stain may reveal *B. henselae* bacilli. In this case, the patient is an elderly woman with vague symptoms and found to have lymphadenopathy and hepatosplenic lesions. Despite negative serology and biopsy stains, her clinical presentation was consistent with Cat Scratch Disease, and she was empirically treated with antibiotics. The improvement in hepatosplenic lesions and the positive convalescent serologies confirmed the diagnosis of Bartonellosis. Negative serology does not exclude the diagnosis and patients should be treated if there is clinical suspicion. Cat Scratch Disease should be considered in patients with unexplained fevers with known cat exposure, even without a history of scratches or bites. Transmission of Cat Scratch Disease has been observed in individuals with cats with fleas and in younger cats.

CONCLUSION: Elderly patients often present atypically with more generalized and systemic symptoms, but Cat Scratch Disease should be considered if the patient's history includes exposures to cats at home, regardless of history of bites or lack thereof.

SECONDARY ADRENAL INSUFFICIENCY UNMASKED BY INFECTIOUS DIARRHEA

Andrea Pagan; Denise Feradov. University of South Florida, Tampa, FL.
(Control ID #3186554)

LEARNING OBJECTIVE #1: Clinicians should consider adrenal insufficiency in all acutely ill patients presenting with undifferentiated shock.

LEARNING OBJECTIVE #2: Adequate treatment of adrenal crisis using stress-dose intravenous steroids shouldn't be delayed for confirmatory testing.

CASE: A 22-year-old African American male with no past medical history presented to the ED with altered mental status, fever and diarrhea for one day.

On physical examination he was febrile, hypotensive, tachycardic and oriented by only to person. Initial workup revealed leukocytosis with a left shift, normal BMP, elevated lactic acid of 2.50 mmol/L, and elevated procalcitonin of 2.23 ng/mL. Imaging including CXR and CT abdomen with oral contrast were unremarkable. CSF, blood and urine cultures were sterile. Stool GI pathogen panel was positive for Enteropathogenic *Escherichia coli*. The patient's symptoms improved after antibiotics were started. However, he continued to have episodes of hypotension requiring fluid boluses. Upon further interviewing, the patient reported weight loss, fatigue, and weakness for two years prior to his current presentation. A random cortisol and ACTH stimulation test were ordered, and the results were consistent with secondary adrenal insufficiency. Stress dose steroids were started followed by a taper. MRI of the brain with contrast showed an atrophic pituitary gland without masses. His symptoms improved, and he was discharged on daily hydrocortisone. On outpatient follow-up, repeated testing confirmed the diagnosis of secondary adrenal insufficiency with suppressed ACTH and cortisol levels. The rest of the pituitary workup was normal.

IMPACT/DISCUSSION: Approximately 6,000,000 people in the United States are believed to have undiagnosed adrenal insufficiency, which becomes clinically significant only during times of physiologic stress, as in our patient. Chronic exogenous steroid use is the most common cause of hypothalamic-pituitary axis suppression that can result in adrenal insufficiency, although hypopituitarism should also be considered. Secondary adrenal failure is easily missed, since many of the classical symptoms of Addison's disease are absent. Clinicians should be aware that the major impact of a stressor in a patient with corticosteroid insufficiency is on the systemic inflammatory and immune response. When the body is unable to modulate this reaction, it creates the exaggerated response observed in this case and mimics shock. This information is important since patients with undiagnosed and diagnosed adrenal insufficiency and are experiencing an active adrenal crisis episode have a dismal prognosis if left untreated.

CONCLUSION: Secondary adrenal insufficiency occurs because of a disruption in the hypothalamic-pituitary-adrenal axis, causing a myriad of non-specific symptoms. The hallmark of adrenal crisis is hypotension and shock refractory to fluid resuscitation and vasopressors. This one is a life-threatening condition and treatment shouldn't be delayed for confirmatory testing.

SECONDARY EVAN'S SYNDROME: A RARE PRESENTING MANIFESTATION OF SYSTEMIC LUPUS ERYTHEMATOSUS

Ankita Aggarwal¹; Anubhav Jain¹; Sarwan Kumar². ¹Wayne State University, Auburn Hills, MI; ²Crittenton Hospital/Wayne state university, Rochester, MI.
(Control ID #3186364)

LEARNING OBJECTIVE #1: To Diagnose Evans Syndrome(ES)

LEARNING OBJECTIVE #2: To identify systemic lupus erythematosus(SLE) as a cause of secondary Evans Syndrome

CASE: A 24 years old female with previous normal menstrual cycles presented with a history of intermittent spontaneous vaginal bleeding for two months and generalized weakness for six months. No obvious gynecological cause for bleeding was apparent after preliminary workup. A detailed evaluation revealed no history of fever, weight loss, hair loss, oral ulcers, photosensitivity and arthropathic symptoms including morning stiffness. On examination, she had stable vitals, conjunctival pallor with a scleral clot over the right eye and petechial hemorrhages all over the body. Detailed systemic examination was unremarkable. Her routine blood examination detected anemia (Hb-4.3gm/dl), low platelet count (5x103/ μ L), normal total leukocyte count and corrected reticulocyte count of 7.4%. Peripheral smear (PS) showed microcytic hypochromic anemia with spherocytes. Bone marrow (BM) aspirate was

cellular with erythroid hyperplasia and megakaryocytes. BT, CT, PT, APTT, d-dimer levels were normal. There was unconjugated hyperbilirubinemia with normal transaminases. Direct antiglobulin (Coombs's) test was positive {3+}. Anti-nuclear antibody (ANA) study was positive (2+, diffuse homogenous pattern) with a titer of 1:320, positive dsDNA (2+) with a titer of 95.0 IU/ml which was suggestive of SLE. Coagulation profile was positive for lupus anticoagulant (LA) and anti-cardiolipin antibodies. She was given three units of whole blood on two consecutive days after admission and eight units of platelets during the hospital stay. She was also started on the treatment of SLE with methylprednisolone 1 gm/day as an infusion for 3 days by intravenous route and was started on tablet prednisolone 1mg/kg from the fourth day onwards. Twelve days after hospitalization, she was discharged in a relatively improved condition with a hemoglobin of 9.1 gm/dl and platelet count of 1.52 x 10³ /µl on a daily dose of 1mg/kg of oral prednisolone.

IMPACT/DISCUSSION: ES was previously considered as a combination of ITP and IHA and /or autoimmune neutropenia in absence of any underlying cause. However, recently the spectrum of illness has broadened to include other systemic diseases, aptly called secondary Evan's syndrome. Though case reports of secondary ES have been reported in literature it is extremely rare to have a patient of SLE presenting as ES. The classical presenting clinical features of SLE like musculoskeletal, constitutional, mucocutaneous, renal and neurologic manifestations were absent with our case making the diagnosis difficult.

CONCLUSION: Our study highlights the need for awareness of the rare entity of secondary ES. A high index of suspicion should be kept by primary care physicians, gynecologists in cases having thrombocytopenia and evidence of hemolysis to look for any underlying secondary etiologies in order to avert a misdiagnosis with attendant consequences in treatment and prognosis.

SECONDARY HYPERTENSION: AN ESSENTIAL DIAGNOSIS

Samantha J. Allen; Elena Lebduska. University of Colorado, Denver, CO. (Control ID #3184683)

LEARNING OBJECTIVE #1: Perform an appropriate workup for newly diagnosed chronic kidney disease

LEARNING OBJECTIVE #2: Consider a diagnosis of autosomal dominant polycystic kidney disease in patients without a textbook presentation

CASE: A 58-year-old man presented to his new PCP to establish care. He had recently visited a health fair and was told his blood pressure was high. He had not seen a doctor for ten years and had no complaints. He denied any past medical history and was not on any medications, including NSAIDs. He was a current ten pack-year smoker but denied alcohol and drug use. He worked as a landscaper. His mother had lung cancer and his father had COPD; both were heavy smokers. Physical exam was notable for blood pressure 144/94 and BMI 27; exam was otherwise normal. Labs were notable for serum creatinine 2.7 (GFR approximately 30) and hemoglobin of 13.3 with MCV 92; lipid panel was normal. Urinalysis showed moderate protein; spot urine protein:creatinine was 0.2. EKG was normal. He underwent renal ultrasound, which showed normal bladder and polycystic kidneys, and MRI, with findings consistent with autosomal dominant polycystic kidney disease (ADPKD).

IMPACT/DISCUSSION: Initial workup to evaluate for target organ damage, screen for a limited number of causes of secondary hypertension, and assess cardiovascular risk is indicated at the time of diagnosis of hypertension. This should include serum chemistry, urinalysis, lipid panel, and EKG. A finding of elevated serum creatinine should prompt urinalysis with microscopy as well as serum and urine electrolytes. Renal ultrasound should be considered to assess size, morphology, and symmetry, and rule out obstruction. In this case, obstruction was considered likely given the patient's age-associated risk of

BPH. Obstruction was ruled out with ultrasound, and a surprising and important diagnosis was made. Classically, a diagnosis of ADPKD is made in a patient with a positive family history and is heralded by flank pain and palpable kidneys on exam. However, up to 25% of patients with the disease have a negative family history, and the majority of patients are asymptomatic. ADPKD is the cause of less than 1% of cases of secondary hypertension. Conversely, hypertension is the most common clinical manifestation of ADPKD and is often present before renal impairment. Blood pressure management is key in slowing the decline of renal function in ADPKD.

CONCLUSION: All patients should undergo a basic workup at the time of diagnosis of hypertension for risk stratification and screening for secondary hypertension. Renal disease is one of the most common causes of secondary hypertension and should be evaluated with serum and urine labs and ultrasound to assess for obstruction and evaluate kidney size and morphology. ADPKD is often asymptomatic and up to 25% of patients have a negative family history. Early and effective blood pressure control is key to slowing the decline of renal function in ADPKD.

SEEING THE POSSIBILITIES: DIAGNOSTIC UNCERTAINTY IN BILATERAL OPTIC NEURITIS

Grace L. Lisius¹; Andrea Carter². ¹University of Pittsburgh, Pittsburgh, PA;

²University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #3167499)

LEARNING OBJECTIVE #1: Describe the typical history, physical exam, and fundoscopic findings of optic neuritis (ON)

LEARNING OBJECTIVE #2: Identify atypical ON findings that should prompt workup for systemic inflammatory and infectious causes

CASE: A 38-year-old healthy male photographer presented to clinic with worsening vision. He had a 1-week history of left eye pain with extraocular movements, 4 days of left peripheral vision distortion with flashes and floaters, and 1 day of diffusely grayed-out left vision. He also had a frontal headache, most severe on awakening, and recent exposure to cats. Exam revealed normal right visual acuity, decreased left visual acuity to finger-counting at 2 feet, and a left afferent pupil defect. Fundoscopic exam revealed bilateral (left greater than right) swelling of the optic nerve. He was admitted. A brain MRI showed bilateral (left greater than right) optic neuropathy without signs of increased intracranial pressure, mass, ischemia, or white matter lesions. Lumbar puncture had normal opening pressure with negative viral and multiple sclerosis (MS) panels. Serologies revealed reactive toxoplasmosis IgM and non-reactive IgG; other infectious and inflammatory markers were negative. Differential diagnosis included primary ON versus ocular toxoplasmosis, and he was treated empirically for both with high dose intravenous corticosteroids and a 6 week course of trimethoprim-sulfamethoxazole, respectively, with complete resolution of headache and vision changes at his 1 month follow up appointment.

IMPACT/DISCUSSION: ON is an acute inflammatory demyelinating injury to the optic nerve and should be suspected in patients with unilateral painful eye movements and hours-to-days progressive vision loss, classically in a central scotoma. Exam always reveals an afferent pupillary defect on the Swinging Flashlight test, with slower pupil constriction when light is shone in the affected eye if the other eye is unaffected. Fundoscopic exam may reveal papillitis with optic nerve swelling. Intravenous corticosteroids speed the visual recovery in ON and reduce the 2-year risk of developing MS. Bilateral ON or signs of infection are atypical, and should prompt evaluation of systemic inflammatory and infectious causes. An acute ocular toxoplasmosis infection, considered here due to a reactive IgM with a non-reactive IgG, was less likely responsible given his lack of chorioretinitis or posterior uveitis.

Ocular toxoplasmosis usually resolves spontaneously, but atypical presentations, such as our patient with concomitant ON, are an indication to treat with antibiotics.

CONCLUSION: Young adult patients with acute unilateral painful vision loss can be diagnosed clinically with ON, but atypical features such as bilateral findings should prompt workup and treatment of alternative systemic inflammatory or infectious processes, especially given the importance of avoiding consequences in vision-related safety, career, and quality of life.

SEGMENTAL ARTERIAL MEDIOLYSIS (SAM) AS A MIMIC OF SYSTEMIC VASCULITIS

Bilal Saqi. Cleveland Clinic Foundation, Cleveland, OH. (Control ID #3186314)

LEARNING OBJECTIVE #1: To diagnose SAM in a patient being treated primarily as vasculitis resulting in harm

LEARNING OBJECTIVE #2: To recognize dissections, aneurysms, hemorrhage or ischemia in the celiac, superior mesenteric and other abdominal arteries as features of SAM

CASE: A 44 year old male with history of hypertension and gout who initially presented with chest and epigastric pain. Initial workup was negative for myocardial infarction and pulmonary embolism, but subsequently on worsening of the pain and elevation of white count and liver enzymes, CT angiography was performed and revealed extensive mesenteric thrombosis including hepatic, splenic and gastroduodenal artery occlusion, portal venous air involving the left lobe of the liver and gastric wall pneumatosis. Heparin was started but ensuing CT revealed new splenic and bilateral kidney infarcts. Furthermore he developed flank pain, thrombocytopenia and anemia. Repeat imaging revealed new right perinephric and retroperitoneal hematomas and increased number of bilateral renal infarcts. Heparin was held and initial workup revealed Heparin Induced Thrombocytopenia but confirmatory test was negative. Angiography revealed dissection in the celiac artery but no active bleeding. His course was further complicated by large left main and segmental right lower lobe pulmonary embolism in the setting of new atrial fibrillation, but his echo was negative for vegetation, thrombi or shunt. Treatment with Argatroban was started and extensive hypercoaguable and rheumatological workup including test for Ehlers-Danlos was negative. He was treated primarily as a patient of vasculitis with steroids and cyclophosphamide and discharged with warfarin. He presented again for flank pain and hematuria and was found to have new interval occlusions of the common hepatic artery and evolving bilateral renal and left hepatic infarcts. In light of celiac dissection and diffuse arterial thrombosis, lack of an inflammatory picture, findings on CTA and Angiography, and exclusion of hypercoagulable state, he was diagnosed with SAM. He was treated with Bivalirudin and discharged on Fondaparinux.

IMPACT/DISCUSSION: SAM is an arteriopathy characterized by vacuolization and lysis of the arterial smooth muscle cells, arterial gaps, separation, and reparative fibrosis. The pathogenesis of SAM is still unknown. Presentation can range from abdominal pain due to acute intestinal ischemia from thrombosis or dissection to intra-abdominal hemorrhage. Systemic vasculitis, connective tissue diseases, congenital vascular diseases such as Ehlers-Danlos syndrome should always be excluded. Misdiagnosis and treatment directed towards vasculitis can lead to harm such as in our patient. Appropriate therapy with angiography and transcatheter embolization should be performed immediately when indicated.

CONCLUSION: In patients presenting with abdominal pain, flank pain, hematuria and arteriopathy, SAM should not be forgotten.

SEIZE THIS PAIN: A CURIOUS CASE OF ACUTE INTERMITTENT PORPHYRIA

Hongyang Pi¹; Benjamin Sprague¹; Akshata Moghe². ¹University of Pittsburgh Medical Center, Pittsburgh, PA; ²University of Pittsburgh, Pittsburgh, PA. (Control ID #3185807)

LEARNING OBJECTIVE #1: Recognize the clinical features of acute intermittent porphyria (AIP)

LEARNING OBJECTIVE #2: Diagnose and treat an AIP attack

CASE: A 34 yr-old woman with migraines presented with two weeks of severe, intensifying, diffuse abdominal pain. For the past year, she had experienced sporadic abdominal and back pain. Three weeks prior to presentation, she was treated for a urinary tract infection with trimethoprim-sulfamethoxazole. She reported nausea with occasional emesis, without fevers or changes in bowel habits. Family history was notable for functional abdominal pain in her father. She did not use alcohol, tobacco, or illicit drugs. Home medications included acetaminophen-hydrocodone and cyclobenzaprine. She was afebrile, with BP of 179/118 mmHg, HR of 144 bpm and RR of 18/min. She was alert with dry mucus membranes. Her abdomen was soft, nondistended, diffusely tender without rigidity or guarding, with reduced bowel sounds. Neurological exam was non-focal. The day after presentation, she had a witnessed generalized tonic-clonic seizure. At that time, her serum sodium level had fallen to 110 mEq/L, from 136 mEq/L on presentation. Liver function tests were normal. CT of the abdomen was unremarkable. EEG showed mild diffuse encephalopathy. Her urine was reddish-orange but urinalysis showed no RBCs. Differential diagnosis included AIP, cyclobenzaprine toxicity and vasculitis. Urine porphobilinogen (PBG) level returned at 100 mg/24hr (normal < 2.4) clinching the diagnosis of AIP. Daily hematin infusions were initiated with gradual resolution of abdominal pain and normalization of vital signs.

IMPACT/DISCUSSION: AIP is an autosomal dominant metabolic disorder caused by deficiency of the enzyme porphobilinogen deaminase (a.k.a. hydroxymethylbilane synthase) from the heme biosynthesis pathway. Diagnosis of AIP is challenging as i) symptoms can be intermittent & vague, ii) abdominal pain has a large differential diagnosis, and iii) as a rare disease, AIP is often not considered or appropriate testing is not performed. Presentation of AIP is highly variable, however most attacks begin with abdominal pain and neurological symptoms. Tachycardia and limb paresthesias are common signs of autonomic and peripheral neuropathy, respectively. Hyponatremia is the most common electrolyte abnormality, and can lead to seizures. Urine appears red-brown due to the presence of porphyrins. As in the case of our patient, drugs are common triggers of AIP. Other triggers include dehydration, alcohol, infections, starvation, and hormonal changes of menses or pregnancy. Spot urine PBG is the best diagnostic test, and if elevated, is sufficient to diagnose AIP. Treatment includes daily infusions of hematin in severe attacks, while mild symptoms can be alleviated with carbohydrate loading with IV dextrose.

CONCLUSION: Consider AIP in a patient with abdominal pain, neurological symptoms & electrolyte abnormalities. Spot urine PBG is the preferred diagnostic test. Treat with hematin in severe cases, or carbohydrate loading in mild cases.

SEPTIC KNEE MONOARTHRITIS DUE TO HISTOPLASMA CAPSULATUM AFTER BONE MARROW TRANSPLANT IN AN APLASTIC ANEMIA PATIENT

Bhavyaa Bahl; Lourdes Corman. UAB Huntsville Regional Medical Campus, Huntsville, AL. (Control ID #3186107)

LEARNING OBJECTIVE #1: Recognize monoarthritis as a rare presentation of Histoplasmosis

LEARNING OBJECTIVE #2: Evaluate diagnostic testing for histoplasmosis in an immunocompromised host

CASE: An 18-year-old male from Alabama presented with progressively worsening right knee swelling and pain for four days associated with fever and chills. He had undergone allogeneic bone marrow transplant a year ago as treatment of aplastic anemia for which he had been on an immunosuppressive regimen with prophylactic antimicrobials till two months ago. He was sexually active with his girlfriend and was recently treated for *Chlamydia trachomatis* urethritis. Magnetic resonance imaging (MRI) knee done five days ago did not reveal any abnormalities. On exam, he was febrile with a T_{max} of 102.9°F. His right knee was inflamed and tender with restricted range of motion. Arthrocentesis done for the knee effusion noted on radiograph revealed grossly purulent synovial aspirate with 19,000 total nucleated cells (90% neutrophils) along with 1+ yeast on gram stain. He was empirically started on vancomycin, piperacillin-tazobactam, and fluconazole for septic arthritis. Arthroscopic synovectomy revealed diffuse inflammation of the joint with the involvement of synovium and vessels on pathology. Blood, synovial fluid and biopsy specimens did not reveal bacterial infection on culture and molecular testing. (1,3)-Beta-D-Glucan assay (Fungitell®), T2Candida® and Histoplasma serology resulted as negative. He was switched to micafungin and discharged after being afebrile for 24 hours to complete 6 weeks of treatment for a fungal septic joint. Five days after discharge, Histoplasma polymerase chain reaction (PCR) on the synovial fluid was reported as positive following which he was changed to itraconazole. Two weeks later fungal cultures from blood and synovial fluid resulted as growing mold identified as *Histoplasma capsulatum*.

IMPACT/DISCUSSION: *Histoplasma capsulatum* is a dimorphic fungus endemic to the Ohio and Mississippi river valley with primarily asymptomatic pulmonary involvement in immunocompetent hosts. Immunocompromised individuals are particularly at risk for a severe and disseminated disease. Bone and joint infection is very rare and mostly manifests as monoarthritis of the knee due to local inoculation or hematogenous spread. Although tedious, fungal culture is the gold standard of diagnosis with 85% sensitivity in disseminated disease and was demonstrated in both synovial fluid and blood specimen at four weeks in this case. Earlier diagnosis can be facilitated with PCR testing (100% specificity) in immunocompromised and disseminated states where *Histoplasma* antibody testing has a high false negative rate and antigen testing has low sensitivity as seen here.

CONCLUSION: Septic arthritis and tenosynovitis are rare complications of Histoplasmosis that must be suspected in immunocompromised hosts particularly in endemic areas. Molecular testing can aid in the earlier diagnosis of Histoplasmosis even in cases with negative serology.

SEVERE HUNGRY-BONE SYNDROME AFTER RESECTION OF FOLLICULAR PARATHYROID CANCER

Norman N. Aiad^{1, 2}, Mat Kladney^{2, 1}. ¹NYU Langone Medical Center, New York, NY; ²Bellevue Hospital, New York, NY. (Control ID #3162804)

LEARNING OBJECTIVE #1: Recognize, manage, and prevent hungry-bone syndrome (HBS)

CASE: A 46-year-old male with a history of hypertension presented with urinary hesitancy and frequency for two months. His only other complaint was aching pain in his back and bilateral legs. Physical exam was significant for tenderness of his lower extremities. Labs were significant for

creatinine of 3.9 mg/dL, calcium of 12.5 mg/dL, and an alkaline phosphatase of 916 U/L. Parathyroid hormone (PTH) was 4393 pg/mL. Phosphate and 25-hydroxy vitamin D were normal, but 1,25-dihydroxy vitamin D was low at 9.1 pg/mL. Renal ultrasound demonstrated bilateral hydronephrosis. CT imaging revealed a left paratracheal soft tissue mass, extensive lytic bone lesions, and multiple renal calculi. Core biopsy of the mass was consistent with follicular parathyroid cancer. The patient received alendronate then underwent parathyroidectomy of the affected gland with post-operative perioral tingling and paresthesias and hypocalcemia with a nadir of 5.5 mg/dL. This patient then required 138g of oral calcium carbonate and 118g of intravenous calcium gluconate along with calcitriol and cholecalciferol over the course of thirteen days.

IMPACT/DISCUSSION: This case exemplifies the potential severity of HBS. This patient's calcium requirement was 256g or an average of 20g/day, significantly higher than reported 6 to 12g/day that a typical HBS patient requires. HBS is defined as rapid and profound hypocalcemia due to an acute withdrawal of PTH after a parathyroidectomy. This is caused by a reduction of osteoclast activity and an increase in osteoblast activity leading to unopposed deposition of bone and resultant hypocalcemia. Hypophosphatemia and hypomagnesemia may also develop. These electrolyte abnormalities will last for weeks to months, but rarely have been reported to last for over a year. Patients who develop HBS are at risk of arrhythmias, heart failure, and seizures. These problems can be prevented with regular serum testing and repletion of calcium, phosphate, magnesium, and vitamin D. Preoperative bisphosphonates and vitamin D repletion have been shown to decrease the magnitude of hypocalcemia post operatively. Patients at risk of developing HBS include those with older age, higher preoperative serum calcium, alkaline phosphatase, and PTH levels, lower preoperative serum magnesium and albumin, parathyroid mass larger than 5 cm³, and those with evidence of brown tumors or osteitis fibrosa cystica. This patient's impressive calcium requirement may have stemmed from his preoperative kidney disease, vitamin D deficiency, and extensive lytic bone lesions.

CONCLUSION: HBS is a life threatening complication that develops as a result of rapid withdrawal of PTH with subsequent electrolyte disturbances. Some evidence suggests that HBS can be prevented with preoperative administration of bisphosphonates and vitamin D. HBS can be managed with frequent electrolyte monitoring and aggressive repletion.

SEVERE LACTIC ACIDOSIS AND PERSISTENT HYPOGLYCEMIA AS A UNIQUE PRESENTATION OF BURKITT'S LYMPHOMA

Sarah Rawi¹; Arundati Rao¹; Bryan F. Stringer². ¹University of Connecticut, Hartford, CT; ²University of Connecticut, New Britain, CT. (Control ID #3185031)

LEARNING OBJECTIVE #1: Recognize and diagnose a unique presentation of Burkitt's Lymphoma associated with electrolyte abnormalities.

LEARNING OBJECTIVE #2: Identify the Warburg Effect.

CASE: 67-year-old male from Ghana with medical history significant for hepatitis B presented with six months of weakness, fatigue, weight loss, dyspnea, and abdominal distension. On physical exam his vitals were stable, he had a soft, non-tender, distended abdomen, bilateral peripheral pitting edema, and penile ulcers noted. His labs were significant for hemoglobin 7.4 g/dL, lactic acid 19.5, mmol/L, corrected calcium of 8.6 mg/dL, glucose of 60 mg/dL, and LDH of 848 U/L. Abdominal CT showed extensive stranding and abnormal density throughout the retroperitoneum, extraperitoneal, presacral and perirectal spaces. There

was diffuse anasarca, a stable right adrenal nodule and mild bilateral hydronephrosis. During the first few days of his ICU stay, he exhibited persistent hypoglycemia despite dextrose infusions. C-peptide, insulin and IGF-1 were all low, supporting a malignant process. Lactic acid peaked at 21 mmol/L, LDH peaked at 1105 U/L and the corrected hypocalcemia trended as low as 7.6 mg/dL. An infectious workup revealed positive testing for HIV, CMV, HSV-1, HSV-2, HSV-6, Syphilis and latent TB. EBV was negative. His HIV viral load was 608k with a CD4 count of 70. He was started on appropriate therapy. Biopsy of his retroperitoneal mass showed aggressive B cell non-Hodgkin Lymphoma. FISH Studies demonstrated rearrangement of MYC without rearrangement of BCL2 or BCL6, favoring Burkitt Lymphoma. He was started on chemotherapy with CHOP and Rituxan, following which his metabolic derangements normalized.

IMPACT/DISCUSSION: Lactic acidosis and hypoglycemia are rare complications of lymphoma. There have been six cases reported with these as the primary presentation of Burkitt Lymphoma. We present a case of a retroperitoneal lymphoma manifesting as severe lactic acidosis and persistent hypoglycemia. The Warburg Effect rationalizes these derangements, namely, tumor cells favor aerobic glycolysis for their high-energy demand, with resultant lactic acidosis and hypoglycemia. This demonstrates the value of recognition of a constellation of symptoms, signs, and lab abnormalities to identify a life threatening illness.

CONCLUSION: This case vignette increases awareness of and shows the precedence of metabolic derangements such as lactic acidosis and persistent hypoglycemia as initial signs of an underlying Non-Hodgkin's Lymphoma. It demonstrates the value of maintaining a broad differential in patients without a unifying diagnosis.

SEVERE NEUROLOGICAL SIDE EFFECTS OF NOVEL IMMUNE CHECKPOINT INHIBITORS USED IN ONCOLOGY

Joshua M. Lennon^{1, 2}; Benjamin P. Liu³. ¹Northwestern Memorial Hospital, Evanston, IL; ²Ann and Robert H. Lurie Children's Hospital of Chicago, Chicago, IL; ³Northwestern Memorial Hospital, Chicago, IL. (Control ID #3184900)

LEARNING OBJECTIVE #1: Review the scope of use, and mechanism of action of immune checkpoint inhibitors

LEARNING OBJECTIVE #2: Recognize severe neurological complications associated with immune checkpoint inhibitors

CASE: A 62 year old male presented to orthopedic surgery on 6/2016 for L elbow pain. During 9/2016 he was found to have a left axillary mass. Biopsy revealed malignant melanoma. In 11/2016 he had L axillary dissection, which was staged at IIIc disease. He completed 4 cycles of ipilimumab from 1/2017-3/2017. During 5/2017, he noted bilateral arm pain, stiffness, and thigh pain for 3 weeks. He was diagnosed with polymyalgia rheumatica, and started on low dose steroids with some improvement. He then complained of R sided headache and jaw pain, hyponatremia, and word finding difficulties. Differential diagnosis included temporal arteritis, but also side effects from the ipilimumab. Lumbar puncture was performed, noting CSF with 97 WBCs, 90% lymphocytes, and elevated protein and glucose. Infectious workup was negative. He was started on methylprednisolone 1g for 5 days with improvement of symptoms. He was discharged on 60mg prednisone. He returned to ED 2 days after discharge with sleepiness, confusion, and hyponatremia to 126. Infectious workup remained negative. He was treated for SIADH, and restarted on methylprednisolone 1g x 5 days and IVIG. He was discharged on 80mg prednisone, and weekly 1g IV methylprednisolone. During 7/2017, he was found by police after a motor vehicle accident confused, with delirium. An

MRI brain showed multiple tiny infarctions. Lumbar puncture showed persistent lymphocytic CSF. He was restarted on high dose steroids and IVIG, and discharged on weekly tapering IVIG.

IMPACT/DISCUSSION: Immune checkpoint inhibitors are approved for multiple cancers, and will continue to be more common in oncology therapies. Their method of action involves boosting the immune response to cancer cells, by stopping the inhibitory signals produced by cancer cells to T-cells. Side effects most commonly involve the gastrointestinal system and the skin, but can affect any organ system. The most severe side effects can affect the lungs, and any part of the neurological system. This case is one of three patients that I have cared for and will present regarding severe neurological side effects from immune checkpoint inhibitors. Effects can occur days, or weeks after treatment begins, and the effects can last for long periods of time. Because of the wide variety of possible adverse effects, primary care and hospital medicine physicians need to be educated about the method of action of these medications, the possible side effects of these therapies, and the need to be vigilant to look for possible signs and symptoms in their patients.

CONCLUSION: - Immune checkpoint inhibitors have been approved for and are used to treat many cancers - Severe side effects can be seen in any organ system, including the neurological system - These symptoms can be recurrent and persistent, and start from days to weeks after therapy is started

SGLT-2 INHIBITOR ASSOCIATED EUGLYCEMIC DIABETIC KETOACIDOSIS (DKA)

Hajira Amir; Sarah Fishman. Lenox Hill Hospital, New York, NY. (Control ID #3186058)

LEARNING OBJECTIVE #1: Diagnose euglycemic DKA

LEARNING OBJECTIVE #2: Recognize euglycemic DKA as a complication of SGLT-2 inhibitors

CASE: A 36 year old male with type 1 diabetes mellitus (DM) presented with complaints of chest pain, dyspnea and vomiting. His home medications included glargin 40 units daily, aspart 15 units with meals and ertugliflozin 15 mg daily. On arrival, he was afebrile, normotensive, and tachycardic at 104 bpm. He was not in respiratory distress and physical exam was unremarkable. Initial blood work was significant for blood glucose 183 mg/dl (70-99), lipase 666 U/L (7-60), trop T 0.15 ng/ml (0.00-0.01), anion gap 17 mmol/L (5-17), HCO₃ 18 mmol/L (22-31), HbA1c 6.8% and urine positive for ketones. He was admitted for suspected atypical acute coronary syndrome. Coronary catheterization, echocardiogram, and CT of the chest, abdomen, and pelvis did not reveal any abnormalities to account for the patient's symptoms and blood test results. He was kept NPO and treated with insulin sliding scale with blood glucose values ranging between 160-260 mg/dl. His chest pain and dyspnea worsened over his first two days of admission. Subsequent blood tests revealed worsening acidosis and increasing anion gap. A diagnosis of euglycemia DKA was considered and beta hydroxy butyrate was measured at 11.5 mmol/L (<0.4) with pH of 7.1 on venous blood gas. A continuous insulin infusion was initiated and symptoms of dyspnea, nausea, and vomiting slowly improved. The patient was transitioned to subcutaneous insulin with glargin and lispro once ketoacidosis resolved. He was discharged on his pre-admission insulin regimen and advised to discontinue ertugliflozin.

IMPACT/DISCUSSION: DKA is a life-threatening complication of DM that occurs as a result of insulin deficiency, often in association with a precipitating trigger such as infection. It is defined by the presence of

metabolic acidosis, elevated anion gap and ketosis. Most often, DKA occurs in the setting of hyperglycemia, however some patients have normal blood glucose, a condition termed euglycemic DKA. SGLT-2 inhibitors are associated with an increased incidence of DKA. These medications inhibit glucose uptake in the proximal tubules of the kidney. The resultant glycosuria and reduced blood glucose concentrations contribute to increased glucagon secretion and ketone production as well as decreased insulin production. Furthermore, ketone elimination by the kidney is reduced further promoting ketonemia. In this ketogenic setting, surgical stress, infection and extended fasting can precipitate ketoacidosis. SGLT-2 inhibitor associated euglycemic DKA has been associated with poor B cell functional reserve, longer duration of DM, poor control of DM, lower BMI, and Type 1 DM.

CONCLUSION: DKA is a life threatening complication of DM. SGLT-2 inhibitors have been associated with euglycemic DKA and require treatment with insulin infusion and discontinuation of the medication.

SHE'S GONE BANANAS! A CASE OF ECTOPIC CUSHING'S SYNDROME PRESENTING AS HYPOKALEMIA AND PARANOID DELUSIONS

Christopher C. Marino; Michelle-Linh Nguyen. University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #3184590)

LEARNING OBJECTIVE #1: Recognize the neuropsychiatric manifestations of ectopic Cushing's syndrome (ECS) and their implications on management.

LEARNING OBJECTIVE #2: Distinguish the clinical features and management of ECS from Cushing's disease.

CASE: A 67-year-old woman with previously controlled hypertension and recent admission for hypokalemia presented with the urging of her daughter for evaluation of paranoid behavioral changes and hypokalemia refractory to lisinopril and spironolactone. Among several unusual behaviors, she became increasingly reclusive, suspicious of family members, and began donating large sums of money to organizations. On admission, she was found to be hypertensive with plethora, proximal muscle weakness, and peripheral edema. Preceding evaluation for hyperaldosteronism was unremarkable. Plasma cortisol and ACTH levels were markedly elevated. Low-dose and high-dose dexamethasone suppression tests failed to suppress her cortisol. Pituitary MRI and inferior petrosal sinus sampling did not localize a pathologic pituitary ACTH source supporting a diagnosis of ECS. Investigation for the ACTH source with FDG-PET and octreotide scintigraphy failed to identify the ectopic lesion. She ultimately underwent laparoscopic bilateral adrenalectomy and her hypokalemia and neuropsychiatric symptoms resolved.

IMPACT/DISCUSSION: ECS is a rare condition with high morbidity and mortality prompting the need for early recognition and management. Localizing the ectopic source of ACTH is critical as surgical resection is frequently curative and ACTH-secreting tumors are often malignant. Cortisol excess results in a multitude of common disease findings including cardiovascular disease, hypertension, diabetes, myopathy, and osteoporosis, therefore making the diagnosis challenging on initial evaluation. Resistant hypokalemia has been found to be a more prevalent feature of ECS than of Cushing's disease and is associated with a higher severity of hypercortisolism and worse prognosis. Depression, anxiety, and cognitive impairment are the most common neuropsychiatric symptoms, though psychosis and mania can also occur. Neuropsychiatric symptoms generally improve with resolution of hypercortisolism though approximately one-third of patients have been found to have residual symptoms one year in

remission. Our case demonstrates that neuropsychiatric manifestations significantly contribute to morbidity and can disrupt the patient's ability to receive appropriate treatment. The preferred treatment of ectopic ACTH syndrome is surgical resection of the ACTH-secreting tumor. However, up to 20% of tumors are never identified despite thorough evaluation thus necessitating management with bilateral adrenalectomy or adrenal enzyme inhibitors.

CONCLUSION: Early diagnosis of ECS is challenging but critical for timely management and potential cure. Neuropsychiatric symptoms of ECS can disrupt care and make follow up challenging. In these circumstances, bilateral adrenalectomy or adrenal enzyme inhibitor therapy may have to be considered earlier.

SHIFTY MIND AND SHAKEN VOICE

Bishir Clayton¹; Ann Goh²; Michelle Sweet². ¹Rush University, Chicago, IL; ²Rush University Medical Center, Chicago, IL. (Control ID #3186033)

LEARNING OBJECTIVE #1: West Nile Virus (WNV) can lead to a variety of neurologic symptoms such as dysphasia, parkinsonism, and bulbar symptoms

LEARNING OBJECTIVE #2: West Nile Virus Encephalitis can have an oscillating presentation which can delay diagnosis

CASE: A 70 year old female with past medical history of diabetes mellitus presented to the emergency department with a 3 day history fever, confusion, and generalized weakness. She had simultaneously developed nausea and anorexia for 2 days that was followed by diarrhea. She was admitted with a diagnosis of viral gastroenteritis, improved with supportive care, and was discharged. Two days after discharge, she began to stare blankly and did not respond to any questions. The fluctuating cognition was accompanied by malaise and persistent fevers. She returned to the hospital and was noted to have oral and abdominal tremulousness. Her labs were significant for leukocytosis with predominant neutrophilia in both serum and CSF, normal CSF glucose, elevated CSF protein, and negative HSV PCR. A CT scan of her brain showed no acute abnormalities. On day 2 of hospitalization, she appeared to be responsive early in the day, but later would not respond to questions or commands. This wavering course continued through hospital day 4 despite labs indicating a down-trending WBC and negative blood cultures. On day 4 of hospitalization her serum and CSF West Nile Virus IgM returned elevated. She continued to improve with supportive care and on day 8 was transferred for acute rehabilitation.

IMPACT/DISCUSSION: WNV can cause a variety of neurologic symptoms in affected individuals that can include combination of parkinsonism, tremors, myoclonus, and encephalitis. Bulbar weakness with symptoms of dysphagia and respiratory failure has been experienced by more than half of individuals. The time it takes from onset of symptoms to development of neurologic disease typically ranges from one day to one week. This patient presents with two notable findings in WNV encephalitis. She experienced bulbar symptoms including dysphasia. While the patient had facial tremors during the course of her illness, the difficulties she displayed appeared to be a challenge of speech production rather than articulation. The fluctuant features of the disease course are also of interest. The initial prodrome that she displayed stereotyped a viral illness with associated confusion and somnolence. The onset of overt encephalitis was unexpected.

CONCLUSION: Awareness of the variable presentations of West Nile Encephalitis may allow clinicians to consider West Nile as a possible etiology of illness in the face of a variety of neurological and/or infectious symptoms that can oscillate in severity.

SICKLE CELL TRAIT, IMMOBILITY AND A CASE OF SEVERE RHABDOMYOLYSIS

Michael Fattouh; Andrew Hunter; Peter C. Smith. Boston Medical Center, Boston, MA. (Control ID #3165665)

LEARNING OBJECTIVE #1: Recognize multiple less commonly cited risk factors for rhabdomyolysis

CASE: Mr. N is a 40-year-old black male with a chief complaint of "I'm in kidney failure." The patient reported darkened urine and a subjective decrease in urine output. On the day prior, he had used intranasal heroin and woke up 5 hours later leaning on a gate with right shoulder pain. Mr. N has a history of schizoaffective disorder, for which he takes aripiprazole 20mg daily, and a longstanding history of intranasal heroin use. Exam was notable for tenderness along his right deltoid. Labs were remarkable for a creatine kinase (CK) elevated to 79,946 IU/L and a creatinine to 6.59 mg/dL. A urine tox screen was positive for only fentanyl. The patient was diagnosed with rhabdomyolysis and acute kidney injury (AKI) and started on IV fluids. The next day, the CK decreased to 41,907 IU/L, however the creatinine increased with an eventual peak three days later to 11.34 mg/dL. When asked how he knew he was in "kidney failure," Mr. N reported a similar presentation 7 months prior: after using heroin he was immobile for multiple hours and was admitted by an outside hospital for rhabdomyolysis with AKI. After accessing the outside records, it was found that his CK was 17,442 IU/L and his creatinine peaked at 19.83 mg/dL. It was unclear why a patient without a history of primary muscular/neuromuscular pathology and without any clear inciting event had two episodes of such severe rhabdomyolysis. Work up was initiated and a hemoglobin electrophoresis eventually revealed sickle cell trait.

IMPACT/DISCUSSION: Sickle cell trait is recognized as a risk factor for exertional rhabdomyolysis. Further, the use of antipsychotic medications has been reported to increase the risk for exertional rhabdomyolysis in sickle cell trait patients¹. One small case series suggests heroin itself may increase the severity of rhabdomyolysis². Here we describe a case of rhabdomyolysis and AKI – with CK and creatinine levels seen in patients with crush injury or malignant hyperthermia – secondary to mild muscle compression in an immobile patient with multiple less commonly recognized risk factors: opioid use, antipsychotic use, and sickle cell trait. With an increasing prevalence of opioid use in black patients coupled with higher prevalence of sickle cell in people of African descent, the risk for rhabdomyolysis may be of particular concern in an already vulnerable patient population.

CONCLUSION: - Sickle cell trait increases a patient's risk for exertional rhabdomyolysis - Patients with sickle cell trait may be at an increased risk for severe rhabdomyolysis even without exertion or notable trauma *Citations* 1. SIGNIFICANT VISUAL IMPAIRMENT IN AN ALCOHOLIC PATIENT

Tatsuya Fujikawa; Atsushi Taniguchi; Yuka Sogabe. Mitoyo General Hospital, Kanonji, Japan. (Control ID #3142142)

LEARNING OBJECTIVE #1: Recognize the clinical features of Wernicke encephalopathy (WE), exhibiting not only typical but non-typical symptoms, such as vision loss

LEARNING OBJECTIVE #2: Treat with intravenous vitamin B1 when WE is suspected

CASE: A woman in her late 20s, who had depression and alcoholism, complained of vision loss for the past 10 days and reduced dietary intake since the last 3 months. Her clinical history includes alcoholic liver injury and depression. She experienced intermittent appetite loss, nausea, and vomiting 3 months ago, but continued consuming alcohol heavily till 2 months ago. She finally visited the Department of Ophthalmology and General Internal Medicine in our hospital on experiencing vision and appetite loss. On presentation to our hospital, her blood pressure, pulse, respiratory rate, and body temperature were 120/87, 113/min, 18/min, and 97.0 °F, respectively. She had a Glasgow coma scale score of 14 as E4V4M6. Ophthalmologic examination revealed vision loss associated with prominent optic disc edema; physical examination revealed bilateral abduction restriction, gaze-evoked nystagmus, anarthria, and muscle weakness of extremities with Manual Muscle Testing grade 3. FLAIR MRI revealed hyperintense signals in bilateral thalamus, areas around the third ventricle, and the Sylvian aqueduct. Hence, she was diagnosed with WE based on clinical history, physical examination, and MRI findings. Intravenous thiamine replacement therapy was, therefore, started. Metabolic work-up, conducted before the thiamine replacement therapy, revealed thiamine deficiency (15 ng/mL, reference range 24-66 ng/mL). Thiamine supplementation improved the patient's impaired consciousness and appetite loss within 2-3 days of treatment respectively, abducens nerve paresis within 2 weeks, vision loss over 3 weeks, optic disc edema by 8 weeks, and the nystagmus over several months.

IMPACT/DISCUSSION: WE, an acute neuropsychiatric syndrome, results from thiamine deficiency, mostly due to alcoholism. WE is characterized by a classical triad of symptoms: nystagmus and ophthalmoplegia, mental status changes, and unsteadiness of stance and gait; these conditions were observed in our case. However, optic disc edema, especially associated with vision loss, is rarely reported in WE. MRI can serve as a valuable tool in WE diagnosis; changes in the thalamus, mammillary bodies, tectal plate, and periaqueductal area are typically observed. WE prognosis depends on a prompt diagnosis followed by thiamine supplementation at high doses. Early treatment prevents its evolution to Korsakoff syndrome, a chronic form of anterograde and retrograde amnesia, that responds poorly to thiamine.

CONCLUSION: Physicians must highly suspect WE when patients manifest the aforementioned characteristic symptoms. Patients may sometimes visit hospitals with vision loss. If WE is even remotely suspected, thiamine injections should be administered to achieve symptom resolution.

SLOW AND SLEEPY: VALPROIC ACID-INDUCED HYPERAMMONEMIC ENCEPHALOPATHY

Jake Schlemmer; Ambili Ramachandran. UT Health San Antonio, San Antonio, TX. (Control ID #3150143)

LEARNING OBJECTIVE #1: Recognize the clinical features of hyperammonemia.

LEARNING OBJECTIVE #2: Identify valproic acid as a potential cause of hyperammonemic encephalopathy.

CASE: A 30 year-old man presented with two weeks of progressively worsening fatigue and psychomotor slowing. Other associated symptoms included periodic episodes of confusion, generalized weakness, fine motor deficits, and shuffling gait. The patient's medical history included a traumatic brain injury in 2016 with subdural hematoma status post decompressive hemicraniectomy and cranioplasty, with resulting seizure disorder

and mood disorder. He had had a recent bone flap excision two months prior that had been complicated by coagulase negative Staphylococcus infection for which he completed 6 weeks of vancomycin. Current medications included brivaracetam, valproic acid, and risperidone. All vital signs were within normal limits. The patient was fully oriented but slightly confused. Strength and sensation were globally intact with normal reflexes and no asterixis. An antalgic, shuffling gait was noted. CT head revealed recent craniectomy changes but was otherwise unremarkable. Electrolytes, cell counts, and liver enzymes were within normal limits. Serum ammonia was 100 micromoles/liter. On further questioning, the patient revealed that he was switched from quetiapine to risperidone a few weeks prior to symptom onset. The patient initially improved with lactulose, levocarnitine, and vitamin B6. Risperidone dose was decreased, and valproic acid was eventually discontinued. At clinic follow-up one month later, patient was improving and eventually reached his baseline at three months after discharge.

IMPACT/DISCUSSION: Altered mental status involves a wide range of etiologies and is a problem commonly encountered by the internist. Determining the etiology of symptoms is key to minimizing morbidity and mortality, especially when the etiology is a patient's own medications. Hyperammonemia can occur in roughly 28% of patients on valproic acid, even in the absence of liver dysfunction. In patients with elevated ammonia from any cause, presenting symptoms may include gait instability, changes in behavior, slurred speech, excessive sleepiness, and gastrointestinal disturbances. Antipsychotic drugs, including risperidone, have been shown to be an independent risk factor for hyperammonemia in patients on valproic acid, as demonstrated in this case. While treatment may not require immediate cessation of valproic acid, prompt measures to reduce serum ammonia should be taken. Initial treatments may involve lactulose, levocarnitine, antibiotics such as metronidazole, and B vitamins. Continuous renal replacement therapy or hemodialysis may be required in severe cases.

CONCLUSION: Valproic acid-induced hyperammonemia can manifest as acute encephalopathy or other symptoms such as gait instability. Internists should be adept in identifying acute encephalopathy due to medications and medication interactions.

SLOW BUT DEADLY

Alexandra Valdighi; Michael P. Smith. University of Nebraska Medical Center, Omaha, NE. (Control ID #3185928)

LEARNING OBJECTIVE #1: Develop an approach to risk stratify patients for an aortic dissection

LEARNING OBJECTIVE #2: Recognize the varied clinical presentations of aortic dissections

CASE: An 87-year-old woman presented with chest pain on inspiration and shortness of breath which came on suddenly. The pain was located on the left side of her chest and in the substernal region, described as a 4/10 "dull ache" and a "pressure sensation." She also reported a mild, nonproductive cough for the past 2-3 days. She denied any previous chest pain episodes and her past medical history included hypertension, left bundle branch block, dementia, and tricuspid regurgitation. She had stable vital signs. She had a known 2/6 murmur along the left sternal border and pain over the xiphoid process with palpation or with deep inspiration. An EKG did not show any changes. Cardiac enzymes, pro-BNP, comprehensive metabolic panel, and complete blood count were all unremarkable. She continued to have a dull aching pain in the same location with a minimal increase in her cardiac enzymes to 0.268 ng/L but decreased to 0.098 ng/L. She continued to complain of some shortness of breath at rest and general

chest discomfort. Vitals continued to remain stable until she spiked a temperature of 101.3 and developed atrial fibrillation with rapid ventricular response. A D-dimer was found to be 4,670 ng/mL. CT angiogram showed abnormal dilation of the aortic root with an aortic dissection. She unfortunately coded and was unable to be resuscitated.

IMPACT/DISCUSSION: Aortic dissections often have varied clinical presentations and thus they can be difficult to diagnose. Subsequently, delays in treatment can lead to fatalities. Since aortic dissections are not encountered frequently, it is important for physicians to consider them in the evaluation of chest pain, especially when it is of sudden onset. The majority of patients describe the pain as "sharp." Neurologic symptoms also occur in approximately 50% of patients. Some patients may present with painless dissections or more chronic onset of dissections. Other unusual initial presentations include congestive heart failure, stroke, or syncope. Elderly are more likely to present with an atypical presentation which may complicate diagnosis in this age group; yet the mean age of dissection is also 65. There are twelve history and physical exam findings that have a high sensitivity for detection of an aortic dissection and can be used to risk stratify patients. A D-dimer score of less than 500ng/mL can be used as a screening test

CONCLUSION: Although aortic dissections have a relatively low incidence, they have a high mortality rate acutely and it is essential for the general internist to diagnose rapidly.

SMALL CELL LUNG CANCER PRESENTING AS LIMBIC ENCEPHALITIS.

Muqsita Nashat¹; Sheetal Patel²; M.Azam Mohiuddin². ¹Mercy Nazareth Hospital, Hamilton, NJ; ²Mercy Nazareth Hospital, Philadelphia, PA. (Control ID #3184442)

LEARNING OBJECTIVE #1: Recognize limbic encephalitis as a paraneoplastic syndrome secondary to malignancy.

CASE: A 58 year old female presented with sudden onset of impaired short term memory of few days duration. Past history includes prediabetes and hyperlipidemia. She is a smoker since age 17 and drinks three glasses of wine every weekend. Her only medication is multivitamin once daily. Physical exam was normal except for a right Hoffman and left extensor plantar reflex and her Folstein score was 25/30. Chest x-ray was normal. MRI brain showed mild small vessel ischemic change without acute intracranial abnormality. She was discharged with a clinical diagnosis of TIA of bilateral posterior cerebral arteries affecting temporal lobes and hippocampus. She was readmitted 48 hours later with new onset seizure and worsening memory. Repeat MRI brain showed hyperintense signal abnormality involving the medial temporal lobes and para hippocampal regions suggestive of infectious or limbic encephalitis. Her CSF showed normal WBC, protein and was negative for JC virus, HSV, Lyme disease and malignant cells. A CT chest showed enlarged right precarinal and paratracheal lymph nodes and biopsy confirmed metastatic small cell neuroendocrine carcinoma. She was discharged home and had outpatient chemotherapy with improvement in memory and remission of cancer.

IMPACT/DISCUSSION: Limbic encephalitis represents a group of autoimmune conditions characterized by inflammation of the limbic system and is commonly associated with paraneoplastic process, infection or autoimmune diseases. Paraneoplastic limbic encephalitis (PLE) can present with acute or subacute onset of mood changes, memory loss, seizure or cognitive dysfunction. The neuropsychiatric symptoms can be present without tumor cell invasion which is caused by an immune response directed to the central nervous proteins which are similar to tumor antigens leading to perivascular

lymphocyte infiltration and ultimately neuronal cell loss causing these symptoms. Most frequent neoplasms associated with paraneoplastic limbic encephalitis are small cell cancer of the lung, testicular tumors, thymoma, breast cancer and Hodgkin lymphoma. The diagnosis of PLE is generally based on the following four criteria which includes clinical findings mentioned above, analyses of CSF, MRI or EEG, exclusion of other neuro oncologic complications and interval of <4 years between onset of neurological symptoms and tumor diagnosis. Furthermore, metabolic encephalopathy, neurotoxic drugs, inflammatory disorders, central nervous system tumors, and neurodegenerative disorders must be excluded. PLE is mostly associated with anti-Hu antibodies and has a positive predictive value of approximately 90% for small cell cancer of lung. Anti-cancer therapy in combination with immunomodulation is more effective in improving neurological symptoms than immunosuppressive treatment alone.

CONCLUSION: This case illustrates an example where PLE should necessitate further evaluation to rule out malignancy.

SO SLOW, SO FAST

Sawsan Abulaimoun; Kamelah Abushalha; Peter Silberstein. Creighton University, Omaha, NE. (Control ID #3185954)

LEARNING OBJECTIVE #1: Nivolumab is a monoclonal antibody targeted towards programmed cell death-1 protein (PD-1) and works by blocking the interaction between PD-1 and its ligands, PD-L1 and PD-L2, thereby unmasking the tumor cells expressing these ligands attempting to circumvent T-cell mediated cytotoxicity. By increasing the activity of the immune system, immune checkpoint blockade can have inflammatory side effects, which are often termed immune-related adverse events (irAE). Although any organ system can be affected, irAE most commonly involves the gastrointestinal tract, endocrine glands, skin, and liver.

CASE: A 59-year-old male with metastatic renal cell carcinoma (RCC) presents to the ED with anasarca, difficulty breathing (due to tongue swelling), muscle aches, and progressively worsening fatigue over the course of six weeks. He was being treated for RCC with nivolumab and had received a total of 11 doses every other week. Initial workup revealed an elevated creatinine (1.76, baseline 1.2) and thyroid stimulating hormone (TSH) level (149 mIU/L). Creatine kinase (CK) was then measured and found to be critically elevated at 2,029 U/L. He was treated with intravenous (IV) fluids for the rhabdomyolysis with a slow decline in CK levels. Endocrinology was consulted to assist in management, and he was given a loading dose of 200 µg IV levothyroxine followed by 100 µg the next day. TSH trended down to 71.6 mIU/L on the day of discharge two days later. Patient continues to receive nivolumab infusions along with levothyroxine. CK and TSH both normalized within two weeks after treatment for hypothyroidism was initiated.

IMPACT/DISCUSSION: Nivolumab is approved for patients with RCC who had received prior anti-angiogenic therapy after showing a statistically significant and clinically meaningful difference in overall survival. In nivolumab monotherapy studies, the median time to onset of immune-related hypothyroidism or thyroiditis resulting in hypothyroidism was 2.9 months (range: 1 day to 16.6 months). Given the normal baseline thyroid function test and the time frame within which the hypothyroidism developed, it is safe to extrapolate a correlation between this patient's hypothyroidism and nivolumab treatment. The normalization of the CK levels with levothyroxine alone (no glucocorticoids were used) makes it more likely that his rhabdomyolysis was a direct result of severe hypothyroidism, although the possibility of autoimmune-related myositis can't be completely excluded. To our knowledge, this is the first reported case of a PD-1

inhibitor causing hypothyroidism severe enough to induce rhabdomyolysis. A similar presentation was reported with ipilimumab (anti-cytotoxic T-lymphocyte-associated protein 4) and the condition improved with thyroxine therapy.

CONCLUSION: Patients on nivolumab and other PD-1 inhibitors should be monitored and screened regularly for irAE.

SPONTANEOUS CORONARY ARTERY DISSECTION IN A 47-YEAR OLD FEMALE, AN INFREQUENT PRESENTATION OF ACUTE CORONARY SYNDROME

Michael Gurin. Beth Israel Deaconess, Boston, MA. (Control ID #3181565)

LEARNING OBJECTIVE #1: Diagnose acute coronary syndrome in patients without traditional risk factors.

LEARNING OBJECTIVE #2: Manage and treat spontaneous coronary artery dissection.

CASE: A 47-year old female with past medical history of Hashimoto's thyroiditis resulting in hypothyroidism and irritable bowel syndrome presented to urgent care with indigestion. The prior evening, she felt a lingering sensation of indigestion after preparing a bottle for her baby. She is G5P0 with 3 adopted children, "several" miscarriages, and 1 ectopic pregnancy. She is a former nurse, drinks alcohol occasionally, and does not use tobacco products or illicit drugs. There is no history of premature coronary artery disease or sudden death in her family. Her home medications include levothyroxine, hyoscyamine, and rifaximin. On further evaluation, physical exam did not reveal any abnormalities. ECG showed sinus rhythm with mild T wave flattening in III and aVF. A troponin level was incidentally checked and was 0.16. She was admitted to the hospital and treated with heparin, aspirin, atorvastatin, and metoprolol for a presumed NSTEMI. Troponins peaked at 0.22. Lipid panel revealed total cholesterol 165, triglycerides 78, HDL 95, and LDL 54. She had a coronary angiogram, which showed diffuse narrowing at a small distal left posterolateral branch, consistent with spontaneous coronary artery dissection (SCAD). No obstructive coronary disease was found. Clopidogrel was added to her medication regimen, and she was discharged with cardiology follow-up.

IMPACT/DISCUSSION: The patient was diagnosed with SCAD, a resultant tear within the artery wall that can lead to an intramural hematoma. This case poses the challenge of diagnosing acute coronary syndrome in the absence of obvious cardiac risk factors or significant ECG changes. Her indigestion could have been mistaken for recurrent gastrointestinal symptoms. SCAD is associated with pregnancy, miscarriage, or early postpartum status, as the hormonal effects during these periods lead to weakening of the arterial wall. A suspected recent miscarriage was thought to be the precipitating etiology. Intense Valsalva or weight lifting, hormonal therapy, and emotional stress are other inciting factors. Definitive diagnostic testing is coronary angiography. Many patients with SCAD have underlying connective tissue disorders and fibromuscular dysplasia. Management is typically conservative consisting of antiplatelet therapy, beta-blockers to reduce arterial shear stress, and statins in patients with dyslipidemia. Cardiac rehabilitation has also been shown to be beneficial.

CONCLUSION: 1. Consider SCAD in both young females and males without traditional cardiac risk factors who present with acute coronary syndrome. 2. Management is usually conservative and involves indefinite aspirin, beta-blockers, one year of clopidogrel, and referral to cardiac rehabilitation. 3. Patients diagnosed with SCAD should be evaluated for connective tissue disorders and fibromuscular dysplasia.

STALLED BY STILL'S - A PUZZLING CASE OF ADULT ONSET STILL'S DISEASE S. MAHARJAN MD, A. OHRI MD, S. FERGUSON MD, M. BHARGAVA MD. HIGHLAND HOSPITAL - ALAMEDA HEALTH SYSTEM, OAKLAND, CALIFORNIA

Suresh Maharjan; Ajay M. Ohri; Monica Bhargava; Sancia Ferguson. Alameda Health System - Highland Hospital, Emeryville, CA. (Control ID #3183536)

LEARNING OBJECTIVE #1: Recognize diagnostic complexity of Adult Onset Still's Disease (AOSD). Rule out potential life-threatening coexisting disorders.

CASE: A 30-year-old healthy, Guatemalan male presented to emergency department with high fevers, headache and neck pain of more than a week. Physical exam was remarkable for a non-pruritic, diffuse, salmon-colored macular rash over his body. Extensive sepsis workup was unrevealing for a clear source of infection. Computer Tomography(CT) head and lumbar puncture were negative. Laboratory data was concerning for elevated transaminases, high C-reactive protein and ferritin of 1731 ng/ml. CT chest and abdomen showed hepatomegaly with extensive lymphadenopathy. Additional laboratory findings of high lactate dehydrogenase, bilirubin, triglycerides and low fibrinogen raised a concern for Hemophagocytic Lymphohistiocytosis(HLH). Hematology was consulted. Bone marrow biopsy ruled out HLH and flow cytometry was negative for malignancies. Multitude of serological tests for autoimmune disorders and viral infections returned negative. Rheumatology was consulted. Based on clinical presentation, workup and patient meeting more than five Yamaguchi criteria, AOSD was suspected. Prednisone was initiated which dramatically improved his symptoms supporting the diagnosis. He was eventually discharged on a tapering steroid regimen with close Rheumatology follow up.

IMPACT/DISCUSSION: George Still first described juvenile Still's disease in 1896 however much remains unknown about the exact etiopathogenesis. Involvement of a complex cytokine network mainly involving macrophages, Tumor Necrosis Factors and Interleukins(IL) is suspected. Several diagnostic criteria have been proposed but so far Yamaguchi criteria(sensitivity of 93% and specificity of 92%) has been widely accepted. There's always a possibility of an overlapping/additional clinical entity like HLH, Macrophage Activation Syndrome(MAS) which are thought to be on the same spectrum but can cause life threatening complications. Our patient did not demonstrate hemophagocytosis on bone marrow biopsy, rather, had a rapid clinical improvement in the setting of modest steroids, making these diagnoses unlikely. The goal of treatment is to resolve physical signs/symptoms and laboratory indices of inflammation. Our patient's ferritin decreased to 40 ng/ml within a week into the treatment, along with clinical improvement. Treatment modalities depend on severity of AOSD ranging from nonsteroidal antiinflammatory drugs to steroids to nonbiologic/biologic Disease Modifying Anti-Rheumatic Drugs.

CONCLUSION: AOSD is a diagnosis of exclusion. The Yamaguchi and Fautrel criteria are both very reliable diagnostic tools. Association with HLH/MAS is rare but not uncommon. Timely diagnosis and treatment is the key to reduce mortality and morbidity which is particularly higher among Asians and patients with disseminated intravascular coagulation. With recent advancement in medical research, hope is high that we might be able to stall Still's disease.

STATIN INDUCED RHABDOMYOLYSIS COMPLICATED BY ACUTE RENAL FAILURE LEADING TO DIALYSIS

Dilshan Dhillon¹; Paul Nona²; Sunjay Modi¹; Zarina Alam². ¹Henry Ford Hospital, Oakland, MI; ²Henry Ford Health System, West Bloomfield, MI. (Control ID #3185617)

LEARNING OBJECTIVE #1: Recognize life changing consequences of statin induced injury in patients with stage IV CKD

LEARNING OBJECTIVE #2: Identify statin induced muscle and kidney injury

CASE: 56 year old male with presents with generalized malaise, myalgias, tea colored urine and loose stools for 2 days. He denies sick contacts, flu like symptoms, fevers, recent changes in medications, dehydration or recent strenuous exercise. He is a former smoker with 35 pack years, social alcohol consumer and denies illicit drug use. His medications include: aspirin 81mg, atorvastatin 80mg and metoprolol tartrate 25mg for coronary artery disease, amlodipine 10mg for hypertension, lantus 8 units for type 2 diabetes and lasix 60mg for stage IV chronic kidney disease. On examination he was hemodynamically stable, ill appearing obese gentleman with tenderness in the major muscle groups of his upper and lower extremities. The rest of his exam was unremarkable. Laboratory studies revealed hyperkalemia at 6.2 mEq/L, creatinine 7.70 mg/dL (baseline around 4 mg/dL), calcium 7.8 mg/dL, phosphorus 9.9 mg/dL, his serum ALT was 41 IU/L and AST was 245 IU/L. Urinalysis was significant for hematuria and proteinuria. Creatine protein kinase (CPK) peaked at 452,312. Patient was found to be in rhabdomyolysis leading to acute on chronic renal failure. Statin was removed, patient was started on continuous infusion of normal saline and furosemide drip. CPK was down trending however due to worsening hyperkalemia and hyperphosphatemia despite adequate urine output, a tunneled-cuff catheter was placed and patient was initiated on hemodialysis. Electrolytes and CPK normalized however patients renal function did not improve leading to end stage renal disease.

IMPACT/DISCUSSION: Cardiovascular disease is a major cause of morbidity and mortality in the world with the prevalence of cardiovascular diseases doubling by 2020. Statin therapy is the primary pharmacologic therapy to achieve low LDL cholesterol in efforts to improve atherosclerotic cardiovascular disease outcomes in primary and secondary prevention. High doses of statins increase the risk of rhabdomyolysis. The US FDA Adverse Event Reporting System database reports that there are 3-12.5 cases out of 1 million of statin induced rhabdomyolysis. Rhabdomyolysis is syndrome where muscle pain and weakness is caused by muscle tissue breakdown with release of intramuscular contents (enzymes, myoglobin, electrolytes) into the circulation. Myoglobin is cytotoxic to renal tubules and causing tubular cast formation and acute tubular necrosis. Cytokine induced arteriolar vasoconstriction in combination with dehydration results in decreased glomerular filtration rate and eventually acute renal failure.

CONCLUSION: This case report is aimed to highlight the risks of high dose statin therapy and to consider a medication/dose review in the setting of advanced chronic kidney disease to prolong time to dialysis, ultimately improving quality of life.

STAY THE COURSE AND DON'T PUT DOWN ANCHORS

Nora Kovar; Michael P. Smith. University of Nebraska Medical Center, Omaha, NE. (Control ID #3186112)

LEARNING OBJECTIVE #1: Develop an approach to pancytopenia in a patient with human immunodeficiency virus (HIV)

LEARNING OBJECTIVE #2: Recognize the role of Anchoring bias plays in the diagnosis and management of patients

CASE: A 45-year-old man presented with unexplained pancytopenia in the absence of any acute symptoms. He endorsed mild headache, right shoulder pain, and bilateral ankle swelling that were chronic. He had a previously identified systolic murmur, decreased range of motion at the right shoulder, and symmetrical swollen ankles. An unintentional 10-pound weight loss in the preceding six months was noted. History included well-controlled HIV infection, on antiretroviral therapy and prophylactic trimethoprim-sulfamethoxazole; untreated hepatitis C, including recent ultrasound showing mild splenomegaly; recent hospitalization for bacteremia of unknown source; and aortic stenosis. He admitted to polysubstance abuse with alcohol, methamphetamine, marijuana, and tobacco. Hemoglobin (5.3) and white blood cells (2.9) were decreased from one month prior. Platelets (46) were stable. Differential showed increased nucleated red blood cells. Peripheral smear showed occasional schistocytes. CRP and ferritin were elevated. Other laboratory studies including B12, folate, lactate dehydrogenase, haptoglobin, and testing for parvovirus and herpes simplex virus were negative. Trimethoprim-sulfamethoxazole was held, with small improvement in all cell lines. Bone marrow biopsy showed 21% blasts, myeloperoxidase stain positive, and was diagnostic for acute myeloid leukemia.

IMPACT/DISCUSSION: This patient's complex history highlights many important considerations for this process. Low socioeconomic status and polysubstance abuse increased the risk for nutritional deficits that could impair hematopoiesis. Exposure to toxins such as alcohol can also suppress the bone marrow. Viral infections, including HIV, hepatitis C, Epstein-Barr, and parvovirus can as well. Medications and infiltrative diseases are another potential culprit in cases of bone marrow failure. This patient also had elevated ferritin, which is a diagnostic criterion for hemophagocytic lymphohistiocytosis, and joint pain, which serves as a reminder that rheumatologic disease (e.g., rheumatoid arthritis, systemic lupus erythematosus) can also cause bone marrow failure or hypersplenism. Another important cause of peripheral destruction is disseminated intravascular coagulation. These latter considerations were relevant in this case given the patient's splenic ultrasound and his history of joint pain and bacteremia. In patients with HIV, it can be tempting to attribute new pathology to the virus itself. However, these patients often have complex histories, and HIV carries increased risk for other disorders, as well. In this case, the increased risk of leukemia in HIV was pertinent to the final diagnosis.

CONCLUSION: Pancytopenia is commonly encountered by the general internist. Because of its broad differential, a thorough evaluation is necessary to avoid missed diagnoses.

STEMI IN A YOUNG PATIENT: ROLE OF AN INTERNIST

Anubhav Jain: Ankita Aggarwal. Wayne State University, Auburn Hills, MI. (Control ID #3186424)

LEARNING OBJECTIVE #1: Identify risk factors of coronary artery disease in young patients

CASE: The patient is a 34-year-old male with no past medical history, no known cardiac risk factors and no family history of cardiac disease who presented to the emergency department with acute onset pressure-like chest pain radiating to his back, bilateral shoulders and arms for an hour. In the ED, he continued to have pain, relieved a little with nitro. He was hemodynamically stable. EKG revealed ST elevation in leads V2-V6 suggestive of anterior wall MI. Troponin was negative initially. Cardiology was consulted. He was taken for an emergent left heart catheterization. A left heart catheterization revealed 100 % occlusion of the left anterior descending(LAD). A drug-eluting stent was placed in it. He was started on optimal medical therapy including aspirin 81 mg daily, ticagrelor 90 mg Q 12 hrs, metoprolol 50 mg

Q12 hrs, atorvastatin 80 mg daily. Workup for possible cardiac risk factors revealed dyslipidemia with hypercholesterolemia (Total cholesterol:257), hypertriglyceridemia(TG:772), low HDL(31), prediabetes(HbA1C:5.7), morbid obesity(BMI 35 with complications), metabolic syndrome(Obese, high cholesterol and low HDL) and smoking (3 pack year history). He was advised about lifestyle modification with diet and physical activity and cessation of smoking.

IMPACT/DISCUSSION: The prevalence of coronary artery disease (CAD) in young patients defined as age as less than 45 years is low (1.2%). The most common risk factors in this population are obesity and a history of smoking, unlike older patients where dyslipidemia and history of diabetes are the most important risk factors. In most young patients, the first manifestation of CAD is STEMI unlike stable angina in older patients.

CONCLUSION: Acute coronary syndrome has a rare incidence in young patients. Since obesity and smoking are the most common cardiovascular risk factors in this population, it is important for us physicians to emphasize the importance of lifestyle modification in these patients to prevent major cardiovascular events. Our case highlights the importance of educating our patients about the risk of developing CAD and ACS at a young age with these risk factors even in the absence of family history.

STERNOCLAVICULAR JOINT SEPTIC ARTHRITIS CAUSED BY ESCHERICHIA COLI IN A HEALTHY ADULT WITHOUT RISK FACTORS.

Liwayway R. Andrade; Saurin Gandhi; Jaison John. The University of Texas Dell Medical School, Austin, TX. (Control ID #3186306)

LEARNING OBJECTIVE #1: To recognize the clinical features of sternoclavicular joint septic arthritis for early diagnosis and medical management.

CASE: A 65-year-old woman without significant prior medical history presented to the emergency department with a five-week history of persistent sharp left anterior neck pain radiating to the left shoulder, worse on movement of the left arm. Pain started following a mechanical fall that resulted in a non-displaced fracture of the right distal fibula, managed non-surgically, but no history of direct trauma to the left neck, shoulder, or arm. She reported fever, chills, nausea and vomiting four-weeks prior attributed to having the flu, but no chest pain, dysphagia, odynophagia, numbness or weakness. Physical exam was significant for asymmetry of the left sternoclavicular joint and mild tenderness to palpation over the area without erythema or edema. Laboratory findings were notable for the absence of leukocytosis and elevation in ESR and CRP. An outpatient MRI showed inflammation of the left sternoclavicular joint. Joint aspirate and blood cultures grew gram-negative rods. Patient was started empirically on cefepime, and infectious disease was consulted. A CT of the abdomen and pelvis was non-revealing for the source of the bacteremia. A transthoracic echocardiogram did not demonstrate vegetation or an embolic source. The source of the infection was never elucidated. Cultures later speciated to pan-sensitive Escherichia coli. Patient was discharged home after seven days and successfully completed a six- week course of antibiotic therapy with ceftriaxone.

IMPACT/DISCUSSION: Infection of the sternoclavicular joint is a rare presentation of septic arthritis occurring in 1% of the general population. Diagnosis requires a high index of suspicion particularly in healthy adults without risk factors as it typically presents subacutely with minimal symptoms: chest pain localized over the sternoclavicular joint (78%), shoulder pain (24%), and neck pain (2%). Sternoclavicular joint tenderness (90%) is the most common and reliable physical finding. Fever, leukocytosis and bacteremia are present in only about half of the cases. Risk factors include history of

IV drug use, extra-articular infection, diabetes mellitus, trauma, and infected central venous catheter; however, no risk factors were present in 23% of cases. Methicillin-sensitive *Staphylococcus aureus* (49%) is the most common pathogen in both blood and joint aspirate, while *Escherichia coli* (5%) is less common. Complications include osteomyelitis, chest wall abscess, and mediastinitis. Soft tissue infection without joint involvement is amenable to medical therapy alone. One study documented a 15% failure rate for medical therapy alone, while another noted an 83% failure rate. Joint and bone involvement require surgical debridement or resection.

CONCLUSION: Early diagnosis of sternoclavicular joint septic arthritis will allow for a higher rate of success with medical management alone.

STEROIDS AND SCLERODERMA RENAL CRISIS: NAVIGATING THE UNKNOWN

Bernard Mendis; Chaya Abelow. Montefiore Medical Center, Albert Einstein College of Medicine, New York, NY. (Control ID #3184230)

LEARNING OBJECTIVE #1: Review the diagnostic criteria for systemic sclerosis.

LEARNING OBJECTIVE #2: Review evidence surrounding steroid use and the risk of scleroderma renal crisis.

CASE: A 70-year-old woman with a past medical history of retinitis pigmentosa and recurrent hospitalizations for hand arthralgias of unknown etiology, on chronic Prednisone and Methotrexate, was referred to the ED by her Rheumatologist after an outpatient BMP revealed a rise from her baseline Creatinine of 0.5 to 2.1 in the setting of new onset hypertension. Prior to presentation, work up for her arthralgias had revealed a positive anti-Scl70 serology. However, given her lack of typical symptoms, she had not yet received a formal diagnosis of systemic sclerosis. On admission, the patient was treated empirically for scleroderma renal crisis with Captopril, and by withholding further prednisone therapy. Initial urine studies were remarkable for hyaline casts, hematuria, and proteinuria. Follow up renal ultrasound revealed bilateral hyperechogenicity prompting a renal biopsy, which revealed thrombotic microangiopathy, secondary renal tubular injury, and interstitial fibrosis consistent with scleroderma renal crisis (SRC). Her creatinine stabilized at 5.3 and the patient was deemed safe with a plan to closely monitor her renal function as an outpatient.

IMPACT/DISCUSSION: Systemic sclerosis (SSc) is characterized by inappropriate deposition of collagen in the skin and internal organs. The pathophysiology is not yet well understood, but has been proposed to be autoimmune, genetic, and environmental in nature. As of yet, there remains no clear consensus on the diagnostic criteria for a preliminary diagnosis of SSc. The Eular Scleroderma Trials and Research Group (EUSTAR) recently proposed a diagnostic approach requiring a combination of: a) Raynaud's Phenomenon, puffy fingers, or ANA, and b) disease specific antibodies, or microvascular changes by capillaroscopy. Initiating therapy would ultimately require a positive HRCT, PFT, or esophageal manometry study. This clinical decision making tool has not yet been validated. The role of steroids in the treatment of systemic sclerosis is controversial. Although the American College of Rheumatology cites corticosteroids (CS) as a treatment option for myalgias in systemic sclerosis, several studies have proposed an association between CS exposure and SRC. A retrospective cohort study published by Teixeira et al observed an OR of 17.4 (95% CI 2.1-144.0) at 1 month and 24.1(95% CI 3.0-193.8) at 3 months of developing SRC post-CS exposure. This observation has been supported by other literature.

CONCLUSION: -Systemic sclerosis is a diagnosis with important implications regarding choice of therapy, morbidity and mortality. A consensus on early diagnostic criteria has not yet been reached. -Delaying corticosteroid

therapy in patients with suspected autoimmune or systemic processes in favor of a more stringent diagnostic work up may be reasonable in select cases.

STEVENS-JOHNSON SYNDROME: POLYPHARMACY GONE WRONG

Nikhil Kolluri; Justin Bandler; Anjali Bhagra. Mayo Clinic, Rochester, MN. (Control ID #3183931)

LEARNING OBJECTIVE #1: Stevens - Johnson syndrome (SJS) is characterized as a severe widespread epidermal necrotizing disorder encompassing <10% of the total body surface with the main cause being an idiosyncratic reaction to systemic medications

LEARNING OBJECTIVE #2: Rapid recognition of SJS is crucial as mortality can be as high as 4-10% with therapy revolving around swift removal of the offending agent and supportive cares

CASE: A 25-year-old male presented with a 3-day history of painful oral desquamation, odynophagia, diffuse rash, and sloughing lesions on his genitals. Past medical history was significant for mitochondrial encephalomyopathy, lactic acidosis, and stroke-like episodes and seizure disorder. He was recently started on lacosamide (on chronic lamotrigine) for status epilepticus and Bactrim for prostatitis. Physical examination revealed diffuse erythematous maculopapular rash, oral candidiasis, and desquamating ulcers of the lips, oropharynx, and genitals. Labs showed a hemoglobin of 9.8 g/dL, leukocytes of 6.5×10^9 cells/L, and lactate of 2.9 mmol/L. A dermatology consult was immediately placed and lesions were biopsied. Workup was negative for blood cultures, HSV, VZV, CMV, Syphilis, Chlamydia, Gonorrhea, Tick borne panel, HIV, and Mycoplasma testing. A fungal culture of his oropharynx revealed candida dubliniensis. Pathology results confirmed Stevens-Johnson syndrome. Ultimately, Bactrim and Lacosamide were thought to be the culprit medications.

IMPACT/DISCUSSION: SJS is characterized as a severe widespread epidermal necrosis causing tissue loss at skin/mucosal surfaces. Diagnosis is based on clinical presentation and biopsy showing full thickness necrosis of the epidermis and keratinocyte apoptosis. The main cause for SJS is an idiosyncratic reaction to systemic medications, with the most common culprits being sulfonamide antibiotics, anticonvulsants (phenytoin, lamotrigine), allopurinol, nevirapine, and NSAIDs. Mycoplasma pneumoniae infection has also been reported to cause SJS. Clinical presentation generally consists of a prodrome of fever and upper respiratory symptoms with progression to ulceration of mucosal areas and painful erythematous vesiculobullous rash. Treatment relies predominantly on quick recognition, prompt withdrawal of the culprit drug, and supportive care with fluids, pain control, and treatment of any superimposed infections (staph aureus and pseudomonas). Adjunctive therapies with corticosteroids, IVIG, and cyclosporine have also shown some promise. Mortality from SJS can range from 4-10% with disease severity being the main risk factor for mortality. By reporting this classic presentation of SJS, we reinforce the typical presentation and steps for diagnosis and treatment.

CONCLUSION: This case illustrates the enigmatic way SJS can present in the setting of a complex medical history, the importance of rapid identification and management of SJS which may be potentially life threatening, and exemplifies the principle of polypharmacy and its detrimental consequences to patients.

STREPTOCOCCUS PERITONITIS AND TOXIC SHOCK SYNDROME FROM OCCULT TUBO-OVARIAN ABSCESS

William R. Mazalewski¹; John Ebene²; Sean Amirzadeh¹. ¹University of

South Florida, Tampa, FL; ²Manatee Memorial Hospital, Bradenton, FL. (Control ID #3185692)

LEARNING OBJECTIVE #1: Assess severely septic patients by performing a complete, sometimes invasive physical examination for the investigation to find a source of infection.

LEARNING OBJECTIVE #2: Recognize that group A streptococcal bacteremia and subsequent toxic shock syndrome can arise from tubo-ovarian abscesses.

CASE: A 47-year-old female with a past medical history significant for uterine fibroids presented to the ED with a five-day history of nausea, vomiting, diarrhea, lower abdominal pain, low grade fever, fatigue, and chills. The abdominal pain was non-radiating and described as a sharp pain that was difficult to localize. On physical exam, she was tachycardic with a heart rate of 120 bpm, tachypneic at 30/min and afebrile. Abdominal exam was significant for diffuse tenderness with voluntary guarding in the lower quadrants, no rebound. Pelvic examination was within normal limits, as was the rest of the examination. Labs revealed a WBC at $9 \times 10^3/\mu\text{L}$ with bandemia, anemia with hemoglobin of 10.5, BUN 75 mg/dL, creatinine 6.7 mg/dL, and a lactic acidosis. A CT abdomen and pelvis with contrast revealed trace free fluid in the abdomen with peritoneal enhancement suspicious for peritonitis. A pelvic and transvaginal ultrasound was performed revealing a fibroid uterus without adnexal masses. Blood cultures were positive for group A beta hemolytic streptococcus sp. She was started on broad spectrum antibiotics but subsequently progressed to septic shock, requiring vasopressors, mechanical ventilatory support, as well as continuous renal replacement therapy. On hospital day 3, a repeat pelvic exam was performed which revealed severe adnexal and cervical motion tenderness with cervical friability. An exploratory laparotomy was performed which showed a ruptured tubo-ovarian abscess. A total abdominal hysterectomy with bilateral salpingo-oophorectomy was performed. Pathology showed necrotizing bilateral fallopian tubes and uterus. Following the surgery, she was maintained on IV antibiotics and was successfully weaned from mechanical ventilation and vasopressor support, ultimately making a full recovery.

IMPACT/DISCUSSION: Tubo-ovarian abscesses (TOA) can result from pelvic inflammatory disease in a pre-menopausal woman. Organisms that are typically implicated are *E. coli*, *Bacteroides* sp, and *Klebsiella* sp. Cases of group A streptococcal (GAS) peritonitis from ruptured TOA have been reported, albeit rare in literature. Toxic shock syndrome is a well described complication of staphylococcal and GAS infections that are often fulminant if not recognized and treated eminently. Presenting symptoms for TOA can be broad, and when caring for a female patient with vague abdominal symptoms, a thorough physical exam can be lifesaving.

CONCLUSION: This case signifies the importance of searching for a cause of septic shock, including repeating invasive portions of a physical examination. It highlights the importance of maintaining vital physical examination skills as an internist to aide in diagnosis when caring for critically ill patients.

STROKE FOLLOWING CARDIOVERSION FOR ATRIAL FIBRILLATION DESPITE PATIENT ON ELIQUIS FOR 2 YEARS

Manishkumar Patel¹; Mulham Shikh Hamdon²; Anubhav Jain¹; Zain Kulairi¹. ¹Wayne State University, Clarkston, MI; ²Wayne State University, Shelby Twp, MI. (Control ID #3185254)

LEARNING OBJECTIVE #1: Apixaban was approved for the prevention of stroke and systemic embolism in patients with non-valvular atrial fibrillation. This was based on the Apixaban for Reduction in Stroke and Other Thromboembolic Events in Atrial Fibrillation (ARISTOTLE) trial. Despite the

use of Apixaban for 2 years of anticoagulation, we describe a patient who suffered an ischemic stroke 24 hours following cardioversion.

CASE: 70-year-old male with history of nonvalvular atrial fibrillation with CHADS-VASc of 2 on apixaban for 2 years, and essential hypertension. Due to symptomatic atrial fibrillation, electrical cardioversion was recommended. The patient was compliant with Eliquis which was confirmed with his wife. A TEE study was not performed prior to the cardioversion as the patient had been anticoagulated for the prior 2 years. The cardioversion attempt was successful and the patient was discharged home on Eliquis in normal sinus rhythm. Approximately 24 hours following the cardioversion, the patient was admitted to our hospital with altered mental status, expressive aphasia and dysarthria, with the remainder of the examination unremarkable. Computed tomography scan showed distal right middle cerebral artery infarct. Computed tomography angiography showed occlusion of the posterior branch of the right middle cerebral artery. Magnetic resonance imaging demonstrated large acute right middle cerebral artery infarct with no shift of the midline structures. Clinically it was determined that he had suffered from a cardioembolic event. Carotid duplex ultrasound showed normal bilateral carotid arteries. Echocardiogram showed ejection fraction 55-60% with no evidence of left atrial dilation or left atrial appendage.

IMPACT/DISCUSSION: In patients with atrial fibrillation, electrical cardioversion can be used to restore normal sinus rhythm. The risk of cardioversion, however, is that it is associated with an increased occurrence of dislodged thrombi originating from the left atrial appendage resulting in a thromboembolic event. The American Heart Association recommends for patients with atrial fibrillation of unknown length of time or for >48 hours therapeutic anticoagulation for at least 3 weeks should be given prior to and 4 weeks after cardioversion. TEE can also be used to rule out thrombi within the heart chambers before cardioversion. Cardioversion data for 577 patients from a phase III trial comparing apixaban with warfarin demonstrated no ischemic strokes or systemic 10 emboli over a 90-day follow up period. Our patient had no evidence of thrombi or echo contrast on TEE prior to apixaban being started, had been compliant with more than 3 weeks of apixaban therapy confirmed with outpatient pharmacy records, and had a low annual risk of stroke. Although no intervention can bring an event rate to zero, an event such as this is concerning.

CONCLUSION: We are reporting a case of failed apixaban therapy to prevent stroke after cardioversion despite this patient being on this medication for 2 years.

STROKE VIS-à-VIS VZV: A CASE OF VZV VASCULOPATHY

Xi Chu¹; Leonidas Palaiodimos¹; Charles Esenwa². ¹Montefiore Medical Center, New York, NY; ²Montefiore Medical Center, Bronx, NY. (Control ID #3182572)

LEARNING OBJECTIVE #1: Recognize VZV vasculopathy as an etiology of stroke

CASE: A 70-year-old man with diabetes, hypertension, and hyperlipidemia presented with incoherent speech. On exam, he was found to have fluent aphasia with comprehension difficulty, phonemic paraphasias and right homonymous hemianopia. Labs showed HbA1c 7.9%, LDL 145 mg/dL, ESR/CRP normal, HIV negative, syphilis TP-PA positive. MRI brain showed acute infarction in the left parietal and occipital lobes, as well as splenium of the corpus callosum and hippocampus, and a chronic left frontal infarct. CTA head/neck showed multifocal areas of moderate to severe intracranial arterial stenoses involving the anterior and posterior circulation, including occlusion in the posterior cerebral artery. Presence of multifocal stroke along with the extensive intracranial stenoses prompted a vasculitis workup. CSF analysis

did not show pleocytosis, was negative for HSV and VDRL, but showed CSF to serum varicella zoster virus (VZV) IgG ratio of 1:9, consistent with positive CNS VZV infection. VZV DNA was not detected in the CSF by polymerase chain reaction (PCR). The patient was treated with a two-week course of IV acyclovir for VZV.

IMPACT/DISCUSSION: Stroke is frequently encountered by the internist, who is familiar with the classic etiologies of stroke. Less common etiologies, however, include CNS vasculitides that are difficult to diagnose, especially when not associated with systemic presentation. Recent studies illuminate the prevalence of VZV vasculopathy, also termed VZV vasculitis, caused by infection of intracranial and extracranial arteries with resultant granulomatous vasculitis. Previously characterized by large artery stroke following zoster rash in immunocompromised patients, newer studies show large and small artery involvement. Further, a third of patients have no preceding rash and even in those with zoster rash, there is a four-month interval between rash and clinical CNS involvement. ESR/CRP can be normal or high. MRI shows white and grey matter involvement and highly suggestive multifocal grey-white matter junction lesions, while cerebral angiography shows focal narrowing and beading. Given the spectrum of clinical presentations, internists should consider CNS VZV vasculopathy as an etiology of stroke not only in patients with recent zoster, but also in those without systemic findings who have multifocal strokes involving grey-white matter junction and/or multifocal narrowing and beading of cerebral vessels. If suspected, CSF should be obtained and analyzed for VZV DNA by PCR and anti-VZV IgG, with antibody analysis being more sensitive. Treatment with IV acyclovir and steroids for two weeks is recommended by consensus.

CONCLUSION: Stroke associated with VZV vasculopathy can present in otherwise immunocompetent patients without preceding zoster rash. It should be included in the vasculitis workup in patients who present with stroke and areas of narrowing and beading of cerebral vessels, as there is available and effective treatment.

STROKE-LIKE PRESENTATION IN A YOUNG ADULT: PML

Aiman Zafer¹; Mukesh Kumar¹; Marilou Corpuz². ¹Montefiore Medical center, Bronx, NY; ²Montefiore Medical Center, Bronx, NY. (Control ID #3185549)

LEARNING OBJECTIVE #1: To recognize that progressive multifocal leukoencephalopathy (PML) can present like stroke

LEARNING OBJECTIVE #2: To recognize that PML can be the first manifestation of HIV/AIDS

CASE: A 32 YO man with no prior medical history presented with numbness, tingling and weakness in his left arm, slurred speech and facial muscle weakness for 1 week. His exam showed left sided facial droop, weakness of left upper extremity with decreased sensations and hyperreflexia. MRI brain showed sub-acute to chronic infarcts involving right frontal lobe, centrum semiovale, corona radiata and posterior watershed territory, hence, acute stroke was diagnosed. Extensive work up was done. He was positive for HIV 1 with a CD4 count of 73 cells/uL. Lumbar puncture was positive for JC polyoma virus PCR (3588 copies/ml). Patient was suspected to have PML although his neuro imaging features were not classic PML findings. Antiretroviral therapy (ART) was initiated. Few weeks later he was readmitted with seizures. A contrast MRI brain performed few months later revealed findings that were more consistent with PML. The follow up MRI brain remained stable and the patient showed clinical improvement in his symptoms.

IMPACT/DISCUSSION: PML is a severe, progressive and fatal demyelinating disease of the central nervous system caused by reactivation of the JC

polyomavirus in immunosuppressed individuals. It is now increasingly recognized in patients with HIV and is an AIDS defining illness. It is seen in advanced stages of HIV disease with CD4 count <200 cells/uL and can also herald the manifestation of HIV. Clinical features overlap with stroke and include altered mental status, hemiparesis/monoparesis, gait ataxia, hemianopia and diplopia. Seizures are often seen. On neuroimaging, the lesions are bilateral, asymmetric, multifocal, preferentially involving the periventricular areas and subcortical white matter of frontal/occipital/parietal lobes and do not exhibit mass effect or contrast enhancement. On CT PML lesions appear as hypodense patchy or confluent white matter regions and on MRI brain as areas of increased signal on T2-weighted images and fluid attenuated inversion recovery (FLAIR) sequences. Although brain biopsy is gold standard for making a diagnosis, the presence of JC virus DNA in CSF using PCR and clinical and neuroimaging findings are sufficient to diagnose PML. There is no specific therapy other than improving host's immune response via continuation or initiation of an effective ART.

CONCLUSION: Strokes in patients less than 40 years old are uncommon except for patients with underlying risk factors for atherosclerotic heart disease. Other causes include vasculitis or infections such as syphilis and HIV. Since PML symptoms can overlap with stroke and initial neuro imaging findings can also be misleading, it is crucial to consider HIV testing in a young patient with no known risk factors presenting with stroke like symptoms. High clinical suspicion in the right clinical context is imperative to proper diagnosis.

SUBCUTANEOUS EMPHYSEMA AS A COMPLICATION OF PULMONARY ASPERGILLOMA

Aya Shnawa¹; Mohammad Almeqdadi². ¹Jordan University of Science and Technology, Allston, MA; ²St. Elizabeth's Medical Center, Brighton, MA. (Control ID #3163514)

LEARNING OBJECTIVE #1: Pulmonary aspergilloma could rarely invade the chest wall without evidence of invasive aspergillosis

CASE: The patient is a 73-year-old male with past medical history of severe chronic obstructive pulmonary disease (COPD), coronary artery disease, 50-pack-year smoking and remote left upper non-small cell carcinoma treated with chemoradiation, who presented with one-week history of shortness of breath and hemoptysis. Patient denied any fever, chills, rigors, or night sweats. He had seen his primary care physician who prescribed him a course of antibiotics and a prednisone taper, with no improvement. On exam, he was found to be afibrile, tachycardic, tachypneic, hypoxic (oxygen saturation of 75% on 2 liters of nasal cannula), afibrile and normotensive. His lung exam was pertinent for rales and rhonchi bilaterally in all lung fields. Laboratory studies showed leukocytosis of 21.1 k/uL with 86% neutrophils, hemoglobin of 7.0 mg/dL, and platelets of 304 k/uL. Beta-1,3-D-Glucan levels of < 31 pg/mL, and galactomannan EIA test index of < 0.5. Chest x-ray showed a left apical cavitary lesion with increasing surrounding soft tissue loss. A CT of the chest showed a left apical cavity with a lobulated ring of soft tissue and a 4-cm masslike abnormality. He was stabilized and started on antibiotics for presumed pneumonia without improvement. He had an episode of excessive coughing, after which a chest x-ray showed extensive left chest wall subcutaneous emphysema. The cavitary lesion aspirate grew Aspergillus fumigatus, he was subsequently started on voriconazole therapy.

IMPACT/DISCUSSION: Aspergillomas are fungal balls arising typically within the frame of a previous pulmonary cavity. Complications may include massive hemoptysis and progression to invasive aspergillosis. Here, we present a case of a pulmonary aspergilloma which was complicated by chest wall subcutaneous emphysema. An aspergilloma consists of Aspergillus

fungal hyphae, fibrin, and mucus in an established lung parenchymal cavity. It has a predilection to occur in patients with COPD with history of a cavitary lesion due to tuberculosis, sarcoidosis, or necrotizing infections. Rarely does an aspergilloma progress to invasive aspergillosis. Here, we presented a case of an aspergilloma within a previous pulmonary cavity that caused a cavitary-subcutaneous fistula in the setting of excessive cough resulting in massive chest wall subcutaneous emphysema.

CONCLUSION: This shows pulmonary aspergilloma could rarely invade the chest wall without evidence of invasive aspergillosis, and sheds light on subcutaneous emphysema as a potential rare complication of aspergillomas without prior trauma.

SUCCESSFUL PREGNANCY IN A NULLIPAROUS, MULTIGRAVIDA ESRD PATIENT WITH HEMODIALYSIS

MARYAM MUBASHIR MD, ALINA WASIM MD

SWATI PATHAK MD, ISAIARASI GNANASEKARAN MD

Maryam Mubashir; Alina Wasim. Lincoln Medical center, Bronx, NY.
(Control ID #3185386)

LEARNING OBJECTIVE #1: Early recognition of pregnancy and initiation of dialysis in ESRD

LEARNING OBJECTIVE #2: Optimal dialysis modality & regimen

CASE: 34-year-old female with uncontrolled DM-1 diagnosed at 12, complicated with nephropathy, retinopathy, neuropathy, neurogenic bladder, gastroparesis, on insulin pump. With 2 prior abortions and a stillbirth. Her CKD progressed from stage 4 to stage 5 after the still birth and AV fistula was created. Subsequently she was found to be 8 weeks pregnant on Sonogram. Her BUN was in range of 33-47 mg/dL during first few weeks of her pregnancy. Maintenance hemodialysis was initiated thrice/week for one week (13 hours total). It was subsequently switched to 6 days/week to avoid hemodynamic instability and to maintain steady biochemical profile. She got 122 sessions in total avg. duration 2.5 hrs. Her BP was controlled with MDopa. Glucose was optimized with Insulin pump. Her anemia was managed with IV iron and subsequently with EPO. She received folic acid and Vit D. Predialysis BUN was maintained at <30 mg/dL & Cr <4 mg/dL. At 31 weeks patient underwent elective C-section due to polyhydramnios. She delivered a live, healthy 5lb baby with Apgar score of 8 and 9 at 1 & 5 min. Both mother and baby did well during the follow up period.

IMPACT/DISCUSSION: The incidence of pregnancy in women on chronic dialysis is 1-7% (3). Evidence shows better obstetrical outcomes if women start dialysis after conceiving as compared to getting pregnant while on treatments. Preferred dialysis regimen entails increments in frequency and duration of treatment (5). Shorter and frequent HD was chosen in light of successfully using similar strategy with other cases in past. This resulted in a good maternal and fetal outcome even though CKD had progressed

CONCLUSION: No clear superiority of different modalities of dialysis has been established as long as the objective of optimizing the blood chemistry is achieved without drastic changes in fluid shift and balance (5, 8, 10). Patients require frequent and close monitoring with prompt optimization of maternal BP, Hb, glucose and chemistries using dialysis along with medications management to ensure successful outcome (3). More over pregnancy outcomes are likely to be more favorable in women who start dialysis after conception (12)

SUGAR, SUGAR HOW YOU GET SO LOW: INSULINOMA, A CASE REPORT

Julia E. Girdler; Sienna Kurland; Alicia Cowley. New York University, New York, NY. (Control ID #3170152)

LEARNING OBJECTIVE #1: Recognize the broad differential for hypoglycemia

LEARNING OBJECTIVE #2: Diagnose an insulinoma

CASE: A 33-year-old male with no significant past medical history was admitted after being found unconscious at his desk with a blood glucose of 28 mg/dL. He reported multiple episodes of confusion, slurred speech, and unsteady gait in the context of fasting that was relieved with meals. He reported almost a decade of high sugar intake - consuming 1.5L of soda and multiple candy bars daily - to prevent lightheadedness. He denied medication or drug use. On admission, he was hemodynamically stable with an unremarkable physical exam. Laboratory values were significant for glucose of 156 mg/dL and then 34 mg/dL after a 5-hour fast. Further work-up revealed insulin of 21 uIU/mL, c-peptide of 2.4 ng/mL (RR 0.8- 3.5), B-hydroxybutyric acid <0.2 mmol/L, hemoglobin A1c of 4.3%, a negative sulfonylurea panel, insulin antibody, toxicology screen, and ethanol level, normal thyroid stimulating hormone, liver function tests, and complete blood count, and borderline-normal ACTH stimulation test. Magnetic resonance imaging revealed a hyper-enhancing mass in the head of the pancreas. He underwent local resection and enucleation of the mass; pathology confirmed an insulinoma.

IMPACT/DISCUSSION: Insulinomas are rare neuroendocrine tumors that classically present with Whipple's Triad: neuroglycopenic symptoms, hypoglycemia, and rapid resolution of symptoms with glucose. Due to their rarity, a broad differential diagnosis for hypoglycemia should be considered first. This includes sepsis, starvation, alcohol-induced hypoglycemia, adrenal insufficiency, hepatic and renal failure. Hyperinsulinemic hypoglycemia narrows the differential to autoimmune hypoglycemia, exogenous insulin injection, secretagogue ingestion, and insulinoma. Anti-insulin antibody and sulfonylurea panel further narrow the differential. Patients with a suspected insulinoma should undergo a supervised fast with serum levels of insulin, c-peptide, and B-hydroxybutyrate drawn once glucose levels reach <50 mg/dL for optimal specificity and sensitivity. An insulinoma is suggested by elevated insulin (3 uIU/mL) and c-peptide (0.6 ng/mL) plus low B-hydroxybutyrate (2.7 mmol/L). Localization of the tumor is done with computed tomography, magnetic resonance imaging, or endoscopic ultrasound, which has the highest sensitivity and specificity for insulinoma. A selective arterial calcium stimulation test can also aid in localization. The majority of insulinomas are benign and can surgically resected

CONCLUSION: When a patient presents with Whipple's triad, the key to diagnosis is thorough history taking, observation, and diagnostic testing. Essential questions include timing of symptoms, comorbidities, medications, and social history. During a supervised fast, inappropriately elevated levels of insulin and c-peptide with low B-hydroxybutyrate establish the diagnosis of insulinoma. Once imaging confirms the diagnosis, benign solitary insulinomas can be surgically resected.

SUSPECTING SARCOIDOSIS: AN UNUSUAL CAUSE OF HEART FAILURE

Callie Plafkin. University of Wisconsin Hospital and Clinics, Madison, WI.
(Control ID #3163576)

LEARNING OBJECTIVE #1: Recognize when to consider infiltrative cardiac disease and pursue further diagnostic work-up

LEARNING OBJECTIVE #2: Identify the role of various imaging modalities in the diagnosis and management of cardiac sarcoidosis

CASE: A 43-year-old male with a history of hypertension, obstructive sleep apnea, gout, and third-degree heart block status post dual-chamber pacemaker placement was admitted to the cardiology service in 12/2017 for management of new acute decompensated systolic heart failure. Prior to presentation, in

7/2014, he was found to have bradycardia and complete heart block, for which he received a pacemaker. At that time a transthoracic echocardiogram (TTE) showed normal left ventricular ejection fraction (LVEF) of 60-65%. Myocardial stress testing in 2014 and 2016 showed no evidence of ischemia. In late 2017, he developed orthopnea, paroxysmal nocturnal dyspnea, leg swelling, and progressive exertional dyspnea precipitated by minimal activity. TTE showed severe dilated cardiomyopathy and biventricular systolic dysfunction with LVEF of 15%. Exam was notable for bibasilar pulmonary rales and bipedal edema. Labs were notable for elevated BNP of 2762 pg/ml (normal range 0-99). Lyme and HIV serologies were negative. Cardiac MRI (cMRI) demonstrated multiple patchy areas of delayed gadolinium enhancement suggestive of cardiac sarcoidosis. Myocardial FDG PET showed extensive areas of abnormal FDG uptake in both ventricles, consistent with active disease. He lacked other clinical or radiographic evidence of extracardiac sarcoidosis aside from intrathoracic lymphadenopathy on PET. He underwent pacemaker upgrade to cardiac resynchronization therapy defibrillator (CRT-D). Signs and symptoms of decompensated heart failure improved with diuresis. Immunosuppressive therapy was initiated with prednisone and mycophenolate, with modest improvement in LVEF (25% in 10/2018).

IMPACT/DISCUSSION: The majority of patients with sarcoidosis present with lung, skin, or ocular involvement, while only a small proportion (estimated 5%) have clinically-significant cardiac sarcoidosis (CS). CS has a wide range of presentations and is often diagnosed late. Arrhythmias and non-coronary distribution of wall motion abnormalities on TTE can suggest the diagnosis, but are insensitive and nonspecific. cMRI has a high sensitivity for CS; it can detect edema associated with inflammation, and fibrosis, suggested by late gadolinium enhancement. FDG PET can quantify metabolically active lesions, helping differentiate scar from active disease and permitting monitoring of treatment response.

CONCLUSION: Our patient experienced a three-year delay in diagnosis of CS following presentation with complete heart block, likely due to paucity of extracardiac manifestations, CS rarity, and insensitivity of initial imaging. Had infiltrative disease been considered and evaluated with early cMRI in this young patient with unexplained conduction abnormality and no evidence of ischemia, progression to florid systolic heart failure might have been prevented.

SYMPTOMATIC COPPER DEFICIENCY IN A PATIENT WITH REMOTE GASTRIC BYPASS SURGERY

Emily C. Atkinson; Morris Jrada; Myint Aye; Charles Okamura. NYU Langone Hospital - Brooklyn, Brooklyn, NY. (Control ID #3184951)

LEARNING OBJECTIVE #1: Recognize vitamin deficiencies in a gastric bypass patient

LEARNING OBJECTIVE #2: Treat copper deficiency

CASE: A 61 year old female with a past medical history of depression, hypothyroidism, dementia, profound insomnia, and remote history of gastric bypass presented with chronic dizziness and orthostatic hypotension with recurrent falls. She had multiple hospital admissions for dizziness, gait instability and falls. Associated symptoms included nausea and vomiting, fatigue, weakness, hypotension, hypoglycemia with low insulin levels, and worsening tingling and numbness in both legs. She denied using zinc containing denture cream or cold tablets. In the ED, her vital signs were stable and blood work was significant for pancytopenia, with a WBC count of 2.2, hemoglobin of 9.4 and platelets of 137. The levels of many vitamins and minerals were checked given her history of gastric bypass and she was found to have a normal iron level with transferrin saturation of 33%, normal levels of vitamins B1, B6, B9, B12, and selenium (58) and low levels of copper, ceruloplasmin, zinc, and

vitamin D. CT and MRI of the brain were negative for acute pathology but significant for severe left temporal atrophy and overall global volume loss. Following admission, she was given intravenous fluids for persistent hypotension with eventual resolution after increasing her home dose of fludrocortisone and starting her on vitamin supplementation for her noted deficiency. She was discharged on a multivitamin with minerals daily, 50,000 units of Vitamin D weekly, 220mg of zinc sulfate twice daily, and 4mg of copper three times a day with close bariatric specialist follow up.

IMPACT/DISCUSSION: Copper plays an essential role in the synthesis of many proteins and its deficiency can cause a variety different symptoms. Symptomatic copper deficiency is rare but can be seen in patients with a remote history of bariatric surgeries. In these patients, absorption of many minerals, including copper, is disrupted and supplementation may be necessary to prevent deficiency. This patient had been suffering from pancytopenia with a normal iron panel, which can be due to copper deficiency. Copper is a required cofactor in iron oxidation during hematopoiesis and its deficiency therefore results in anemia. Patients with hypocupremia may present with gait abnormalities from myelopathy, as noted in our patient. Additionally, imaging showed cerebral atrophy, possibly related to demyelination, which can be seen in patients with Menkes Disease, a mutation causing defects in copper absorption. Despite having these symptoms for years, her copper levels had not been checked prior, which delayed the diagnosis of copper deficiency.

CONCLUSION: Many of the symptoms of copper deficiency are non-specific, which may delay diagnosis until after many hospital re-admissions. It is essential to always consider copper deficiency in a patient with chronic neurologic symptoms and anemia with a remote history of gastric bypass surgery.

SYNTHETIC CANNABINOID USE ASSOCIATED WITH ACUTE KIDNEY INJURY

Nkiru Osude¹; Anthi Katsoulis². ¹Loyola Medical Center, Crystal Lake, IL; ²Loyola University Medical Center, South Barrington, IL. (Control ID #3184674)

LEARNING OBJECTIVE #1: Recognize acute tubular necrosis as a complication of synthetic marijuana inhalation.

CASE: A 22 year old with no past medical history but with daily marijuana use initially presented to the outside hospital emergency department (ED) with severe diffuse abdominal pain and intractable nausea and vomiting. Laboratory during his ED admission was notable for a BUN/Cr ratio of 25/1.77. He was discharged home presented to our hospital four days later with similar complaints. On examination his blood pressure was 170/105, heart rate was 75, respiration rate was 20 with oxygen saturation 100% on room air. He had a loud mid systolic murmur at the left sternal border associated with a thrill; elevated jugular venous pressure with no peripheral edema. Laboratory was consistent with Cr of 14.7, BUN of 71, HCO₃ of 19, and an anion gap of 15. Potassium was 5.1 with phosphorus of 5.7. Urine analysis was positive for large amount of blood, leukocyte esterase, and >180 white blood cells. Urine drug screen was positive for cannabinoids. The remaining laboratory tests including HIV, ANA, ANCA, complement levels, hepatitis serologies, extractable nuclear antigen panel were negative. Renal ultrasound demonstrated normal renal size with increased renal echogenicity. CT Abdomen and Pelvis demonstrated extensive perinephric fat surrounding the right kidney. Trans-thoracic echocardiogram demonstrated normal left ventricular ejection fraction with right ventricular enlargement. No valvular dysfunction was identified. Biopsy of right kidney demonstrated severe acute tubular injury with abundant granular casts. Due to patient's anuria with worsening acidosis dialysis was initiated. He was discharged with close nephrology follow up for daily dialysis

monitoring. A week later after his discharge he began to make urine and his creatine decreased to 1.31 without need for continuation of dialysis.

IMPACT/DISCUSSION: This case highlights the severity of the current epidemic of synthetic marijuana toxicity, and the need for rapid, reliable testing to allow for in hospital diagnosis of the inciting agent. The patient's initial symptomology and the rapid improvement of symptoms without treatment interventions in the setting of marijuana use makes synthetic marijuana as the causative agent that lead to the patient's ailments.

CONCLUSION: Synthetic marijuana has emerged as a new recreational drug that's toxicities have begun to plague hospitals across the United States. The physiologic effects of synthetic marijuana are similar to that of marijuana, but with more serious toxicities that range from neuropsychiatric disorders, cardiovascular side effects, coagulopathies, to acute tubular necrosis. In 2018 in Illinois alone over 250 cases of suspected synthetic cannabinoid toxicity documented. Synthetic marijuana does not appear on urine drug screen and there is not a quick and reliable screening test that physicians may use to diagnose this intoxication while in the hospital.

SYSTEMIC LUPUS ERYTHEMATOSUS: A PANCYTOPENIC AND PANCREATIC PRESENTATION

Bilawal Ahmed; Shil Shah; Omar Chaudhary; Firas Siddique; Mazhar Mustafa; Byron Okwesili. American University of Antigua, Brooklyn, NY. (Control ID #3140674)

LEARNING OBJECTIVE #1: Diagnose Systemic lupus erythematosus with pancreatitis and pancytopenia as initial presentation

CASE: 15yo F presented with abdominal pain, nausea, vomiting & nonbloody diarrhea which began 4 days prior to admission; localizing to RUQ on day 2. Associated symptoms of nonbloody diarrhea & nonbloody/nonbilious vomit for 4 days. No contributory PMH or PSH. Denies any drug allergies. General physical examination revealed a fine lacy rash on all 4 extremities. Vitals T 37.9, HR 104, RR 18, BP 99/58. No guarding/rigidity & no masses/orgomegaly appreciated. CBC revealed profound pancytopenia with a platelet count of 115 (150-400 x103/uL), hemoglobin 8.5 (12-15 g/dL) and white blood cell 1.5 (4.5-13 x103/uL). Lipase was 489 u/L and LDH was 2392 u/L. Other labs, including CMP, lipid panel, CRP & pregnancy test all within normal limits. Patient admitted with diagnosis of pancreatitis with pancytopenia & supportive treatment with investigative studies initiated. BM biopsy unequivocal. ID consulted. New laboratory test results indicated positive IgG & IgM antibodies to Brucella, Rickettsia, Ebstein Barr Virus & Parvovirus, complicating the diagnosis. Started on doxycycline empirically. Rheumatology consulted most likely etiology to be SLE; await Lupus Panel. ESR was 74 mm/hr, + antinuclear antibody 1/640, + antidoublestranded DNA Antibody 1/320, + anti Smith antibody, - rheumatoid factor, C3 <40mg/dL, Lipase 2784 u/L, FOBT positive. Following lab results & clinical course, the diagnosis of Systemic Lupus Erythematosus made on day 4 of admission. Steroids initiated & status observed closely. Lipase continued to rise to 8,136 u/L which prompted an MRCP showing extensive changes of pancreatitis with upper abdominal fluid, no organized collection or dilation of ducts. Also noted was extensive wall edema of the gallbladder with no filling defect. Lipase began trending down on day 2 of steroids. CBC corrected to WNL. Patient reported feeling better & continued improving.

IMPACT/DISCUSSION: Acute pancreatitis occurs in 2- 8 % of patients in the setting of an active SLE flare [1,2]. The initial presentation of pancreatitis is similar to patients without SLE with an increase in lipase and LDH. The use of IV glucocorticoids or azathioprine has been shown to reduce mortality in SLE associated pancreatitis & an overall decrease in mortality from 61% to 20%[3]. Pathogenesis of SLE leading to acute pancreatitis is not well understood but

proposals have identified vascular damage arising from vasculitis & a concurrent thrombosis as a potential cause [4].

CONCLUSION: The case aims to facilitate diagnosticians in their evaluation of patients presenting with rare manifestations of SLE. SLE should be considered in cases of pancreatitis when common etiologies have been ruled out and symptoms are not resolving despite appropriate treatment. In regards to hematologic abnormalities, SLE can cause various cytopenias as an initial presentation; pancytopenia has been reported fewer times in the literature.

TAKAYASU'S ARTERITIS PRESENTING AS VASCULITIC NEUROPATHY

Anna Zemke; Shilpa Sridhar; Xiaomei Meng. The Ohio State University College of Medicine, Columbus, OH. (Control ID #3183367)

LEARNING OBJECTIVE #1: Maintain a broad differential when atrial occlusion is demonstrated on imaging, especially if hypercoagulability workup is unremarkable.

LEARNING OBJECTIVE #2: Recognize that nerve pain could be an insidious presentation of Takayasu's Arteritis, and that neuropathic pain secondary to ischemic nerve damage is possible.

CASE: A 35-year-old female with a history of carpal tunnel syndrome, recent fall, and hypertension presented to the emergency department with chest pain and left-sided neck and shoulder pain with numbness. Physical exam demonstrated asymmetric upper extremity pulses. CT was performed to rule out pulmonary embolism, but demonstrated occlusion of the left subclavian artery. CT angiography showed partial left subclavian occlusion and left brachial artery dissection. MRI confirmed these. Thrombectomy was attempted but no thrombus was retrieved. The brachial artery had extreme intimal thickening and was chronically occluded. Hypercoagulability workup was negative. Rheumatologic workup demonstrated positive dsDNA but negative ANA by IFA. Her age, gender, symptoms, and physical exam are consistent with Takayasu's Arteritis. This patient met 4 out of 6 American College of Rheumatology criteria for TA. Presence of three or more of these criteria has a sensitivity of 90.5% and specificity of 97.8% for TA. The patient was discharged with prednisone and aspirin daily.

IMPACT/DISCUSSION: This patient's symptoms of left-sided neck and shoulder pain with left upper extremity numbness can be explained by acute or chronic occlusion of large arteries. Interestingly the patient had a 4 year history of arm weakness and numbness which had been diagnosed as Carpal Tunnel Syndrome. EMG had shown median neuropathies, right ulnar neuropathy, and diminished ulnar sensory amplitudes, consistent with a length-dependent neuropathy. The patient underwent bilateral carpal tunnel release 1 year prior to presentation, but her symptoms worsened. Her progression makes her initial diagnosis doubtful. It is more likely that her symptoms are attributable to a neuropathy associated with TA. This condition has not been previously reported based on our review. Inflammation of the walls of neural and epineurial arteries is the main pathophysiological feature of vasculitic neuropathy. Optic neuropathy has been shown with TA, secondary to acute ischemia of the short posterior ciliary artery. Other specific mononeuropathy has not been shown previously. Unfortunately biopsy was not obtained, but if active inflammation persists her symptoms could be improved with steroid therapy.

CONCLUSION: 1. TA is a systemic large-vessel vasculitis of unknown etiology that often affects young women. Here we report a case TA confounded by peripheral neuropathy. 2. Clinicians should have heightened suspicion for TA in young patients with symptoms of limb pain, lightheadedness and unexplained falls. 3. Nerve pain in TA could be secondary to ischemic nerve damage. It is possible for neuropathy to be the initial symptom of an insidious presentation of TA.

TAKES A LONG TIME TO GET DRESSED WHEN IT'S COLD

Jennifer Shiroky¹; Jarratt Pytell². ¹Johns Hopkins Bayview Medical Center, Baltimore, MD; ²Johns Hopkins University, Baltimore, MD. (Control ID #3167488)

LEARNING OBJECTIVE #1: Discuss an atypical presentation of Drug Reactions Eosinophilia with Systemic Symptoms syndrome (DRESS)

LEARNING OBJECTIVE #2: Appreciate cognitive biases that lead to diagnostic delays

CASE: Mr V is a 61yo man with a history of schizophrenia, bipolar disorder, intellectual disability with a speech impediment, who presented with one week of worsening shortness of breath and cough, and one month of diffuse body rash and anasarca. Initial report was one month of dry, peeling skin despite using lotions daily. The rash was accompanied by progressive swelling throughout his body and chills, wearing 4-5 layers of clothing to feel comfortable. He denied recent changes to his home medications, which included lurasidone and aripiprazole for the last year. At presentation, his temperature of 32.5°C and his physical exam demonstrated a full body dry desquamating rash with excoriations, diffuse non-pitting edema, diffuse lymphadenopathy, and diminished breath sounds with an expiratory wheeze. Labs were notable for eosinophilia and monocytosis, a normocytic anemia, acute kidney injury, and proteinuria. CT of the chest, abdomen and pelvis revealed diffuse lymphadenopathy and right upper and lower lobe ground glass opacities. He was admitted for evaluation and management of hypothermia with initial concerns for an infectious process, drug reaction, or hematologic malignancy. He was treated empirically for pneumonia without improvement. Dermatology consult initially described skin findings as "dermatitis of neglect" with no evidence of a primary cutaneous process, findings to suggest inflammatory lesions, or drug reactions and declined to do a biopsy. Family collateral reported good personal hygiene and no changes to his lifestyle supporting "dermatitis of neglect." Concern for cutaneous T-cell lymphoma or other lymphoproliferative process prompted an inguinal node resection, which revealed necrotizing granulomatous lymphadenitis with normal lymph node architecture. Blood work revealed an IgG lambda monoclonal gammopathy, normal flow cytometry and T-Cell receptor testing consistent with polyclonality. Repeat dermatology consult resulted in a skin biopsy revealing subacute/chronic spongiotic dermatitis. In the setting of negative infectious and oncologic work up, aripiprazole and lurasidone were discontinued for presumed DRESS syndrome with full resolution of his symptoms.

IMPACT/DISCUSSION: DRESS is characterized by fever, a spectrum of rashes, eosinophilia, and multi-organ damage. Mr V experienced diagnostic delay due to an atypical presentation with hypothermia, subacute course of symptoms, and no recent medication changes. This contributed to a variety of diagnostic cognitive biases including the authority bias, attribution effect, and anchoring.

CONCLUSION: This case is a lesson in maintaining a broad differential diagnosis through the diagnostic and management process, and the importance of encouraging an environment where providers feel comfortable and empowered to question the diagnostic reasoning of colleagues.

TAKING HEPARIN MONITORING TO LEVEL XA

John Xie. Tulane University School of Medicine, New Orleans, LA. (Control ID #3184143)

LEARNING OBJECTIVE #1: Distinguish between the two main methods of monitoring heparin

LEARNING OBJECTIVE #2: Accurately diagnose heparin resistance using the anti-Xa level

CASE: A 42-year-old woman in the intensive care unit with chronic pancreatitis and bacteremia was found to have a massive pulmonary embolus (PE) and treated with tPA. Heparin drip was then initiated and monitored using anti-Xa levels per hospital protocol. The anti-Xa levels were measured every six hours and returned with values of 0.09 IU/mL - 0.18 IU/mL (therapeutic: 0.30-0.70 IU/mL) despite increasing doses of heparin (up to 35,000 IU/day). Fresh frozen plasma was administered, which transiently increased anti-Xa level to 0.46 IU/mL, but then decreased to 0.17 IU/mL. Treatment was changed to argatroban and aPTT reached therapeutic levels in less than 24 hours. The ATIII activity level returned low at 26% (Ref range: 87-130%), confirming a diagnosis of heparin resistance due to antithrombin III (ATIII) deficiency.

IMPACT/DISCUSSION: Laboratory monitoring of heparin is traditionally done using the activated partial thromboplastin time (aPTT). The aPTT is a clot-based test that measures the intrinsic and common pathways of the coagulation cascade. Falsely elevated aPTT levels can result from co-administration of warfarin, antiphospholipid antibodies, and factor deficiencies. Falsely depressed aPTT levels can occur with elevated factor VIII and fibrinogen. The anti-Xa assay is a chromogenic assay that directly measures the activity of activated factor X through a spectrophotometer. It is a more specific test for measuring heparin activity than aPTT and is not affected by the other clinical factors mentioned above. Heparin resistance can be considered with a sub-therapeutic response after using 35,000 IU of heparin per day.[1] The most common cause of heparin resistance is ATIII deficiency but can also be caused by elevated acute phase reactants, particularly factor VIII and fibrinogen. Elevated factor VIII levels are often present in critically ill patients, which will falsely shorten the aPTT level.[2] This makes it difficult to evaluate whether a low aPTT value after heparin administration is due to true resistance (ATIII deficiency) or a pseudo-resistance (elevated factor VIII).[3] Heparin administration can decrease ATIII levels by as much as 30% due to increased clearance, which can result in falsely low values.[4] Therefore, the anti-Xa level is the most specific test for detecting heparin resistance. In ATIII deficiency, fresh frozen plasma (FFP) challenge will transiently replete the low ATIII level briefly results in a therapeutic anti-Xa. [1] <https://www.ncbi.nlm.nih.gov/pubmed/19533051> [2] <https://www.ncbi.nlm.nih.gov/pubmed/8778420> [3] <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5998275/> [4] <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5998275/>

CONCLUSION: The anti-Xa level is a more specific for diagnosing heparin resistance and can also distinguish between true resistance and pseudo-resistance.

TAKOTSUBO CARDIOMYOPATHY ASSOCIATED WITH HYPOGLYCEMIA

Soumya Mamidi¹; Lakshmi Priyanka Mahali²; Kristin A. Swedish². ¹Montefiore medical center, Bronx, NY; ²Montefiore Medical Center, Bronx, NY. (Control ID #3186249)

LEARNING OBJECTIVE #1: -Recognize hypoglycemia as a potential cause of Takotsubo cardiomyopathy (TCM).

LEARNING OBJECTIVE #2: -Differentiate TCM from myocardial infarction (MI)

CASE: A 88 year old man with Type II Diabetes Mellitus(T2DM) on insulin and chronic kidney disease (CKD III) was admitted for altered mental status after being found confused on floor. Noted to be hypoglycemic by paramedics with a blood glucose level of 50 mg/dl. Initial labs showed elevated Creatinine kinase(ck) and troponins, Electrocardiogram (EKG) showed non-specific repolarization changes, raising concern for Acute Coronary Syndrome (ACS). Echocardiogram (ECHO) showed severely reduced Ejection Fraction (EF%) OF 20% with a large region of apical akinesis, suspicious for TCM.

Patient's hospital course was complicated by recurrent episodes of hypoglycemia as low as 27 mg/dl. Myocardial perfusion scan obtained on Day 7 of hospitalization showed significant improvement in EF to 45% and showed only a small area of apical akinesis. Based on above findings, patient was diagnosed with Takotsubo cardiomyopathy associated with hypoglycemia.

IMPACT/DISCUSSION: TCM known as stress induced cardiomyopathy (SICM) is a syndrome characterized by transient regional systolic dysfunction of the left ventricle, mimicking MI. The pathogenesis is not well understood. One of the mechanisms suggest that it may be caused by diffuse catecholamine-induced microvascular spasm or dysfunction, resulting in myocardial stunning or by direct catecholamine-associated myocardial toxicity. Hypoglycemia is thought to be one of the physical stresses triggering catecholamine release. In patients with T2DM and CKD, hypoglycemia can be due to the potentiating effect of insulin in the setting of impaired renal function. Hypoglycemia is a relatively common case in emergency department (ED); However, wall motion abnormalities are not usually expected in these patients. Thus, undiagnosed self-limited TCM cases are possible among them. This might warrant an ECHO as not to overlook TCM in the ED. TCM can be differentiated from MI by absence of obstructive coronary disease. If coronary disease is found, the diagnosis of stress cardiomyopathy can still be made if the wall motion abnormalities are not in the distribution of the coronary disease. Management of patients with SICM is overall supportive and conservative. The prognosis for SICM is good without management and cardiac function recovers during less than 1 month.

CONCLUSION: 1. Careful history taking is important in evaluation of patients presenting with positive cardiac bio-markers. 2. Insulin should be used cautiously in patients with CKD to prevent hypoglycemic episodes, which can lead to severe adverse effects including SCM.

TAKOTSUBO CARDIOMYOPATHY FROM METHAMPHETAMINE RELATED SEIZURE

Hanyuan Shi; Hania Adib. Tulane University, New Orleans, LA. (Control ID #3186376)

LEARNING OBJECTIVE #1: 1. Diagnose seizure related takotsubo cardiomyopathy, and the dangers leading to sudden death

LEARNING OBJECTIVE #2: 2. Recognize the importance of recognizing cardiac complications such as neurogenic stunned myocardium in the ICU setting

CASE: A 62-year old postmenopausal female with a history of hypertension and COPD initially presented with seizures to an outside hospital. Was loaded with levetiracetam and midazolam but became apneic and was emergently intubated. Drug screen positive for benzodiazepines and mass spectrometry positive for methamphetamine. Initial laboratories significant for leukocytosis (WBC at 16), lactate of 2.1, and troponin of 0.7. EKG showed normal sinus rhythm, 1mm ST elevation in V2, 1.5 mm ST elevation in V3, T-wave inversions in inferolateral leads. There was concern for acute coronary syndrome so the patient was aspirin loaded (600 mg), clopidogrel loaded (300 mg), and started on heparin drip. Transthoracic echocardiogram showed severely decreased ejection fraction < 20%, apical akinesis and ballooning, with only the base of the left ventricle contracting. Troponin peaked at 1.15 and Takotsubo was strongly suspected. When the patient was hemodynamically stable and extubated, a right and left heart catheterization was done for ischemic work-up. RHC showed normal PA pressure (26/8), and wedge (15). LHC showed right dominant coronary system, patent left main, patent LAD and diagonal, as well as patent circumflex and right coronary artery. 24-hour EEG was done by neurology that showed focal periodic epileptiform discharges over the anterior temporal region, focal polymorphic delta activities,

and background slowing with no active seizures. An MRI head showed diffuse confluent T2 hyperintensity in the bilateral white matter consistent with Binswanger's Disease. The patient was pre-emptively treated with acyclovir for herpes encephalitis, but discontinued when HSV was negative in the CSF from a lumbar puncture. She recovered well and was discharged uneventfully with levetiracetam.

IMPACT/DISCUSSION: Seizure-related Takotsubo cardiomyopathy can lead to sudden unexpected death in epilepsy (SUDEP), and is frightening underdiagnosed and worked-up in the neurocritical population. Injury to the myocardium can occur due to neurogenic stunning; there is no myocardial infarction (no coronary vessel block) but rising catecholamine levels are believed to be directly toxic to cardiac myocytes as well as vasospasm of the coronary vessels. Here there was transient severe systolic dysfunction after convulsive seizure with completely clean coronaries after the patient stabilized.

CONCLUSION: There has been increasing interest in the neurocardiology community in routine monitoring with ECGs and echocardiograms in hospitalized patients with ischemic strokes, hemorrhagic strokes, and epileptic events. Takotsubo's has a reasonably high 8% mortality rate, and this case elucidates the need importance for controlling the cardiotoxic stressor (seizures) in order to prevent cardiac damage.

TAKOTSUBO CARDIOMYOPATHY UNEXPECTEDLY RECOVERS IN 24 HOURS

Kirolus Sourial^{1, 2}; Saif M. Borgan^{1, 2}; Hiren Patel¹; George Yazigi^{1, 2}; Jooby John^{1, 2}; Ali Ashraf⁴. ¹University of Central Florida College of Medicine, Orlando, FL; ²Central Florida Cardiac & Vascular Institute at Osceola Regional Medical Center, Kissimmee, FL. (Control ID #3184263)

LEARNING OBJECTIVE #1: We describe a case of Takotsubo cardiomyopathy (TTC) presenting as Ventricular Fibrillation (V-fib) cardiac arrest with an acute recovery of left ventricular (LV) systolic function within 24 hours.

CASE: A 71 year old woman with past medical history of CAD with prior CABG was brought to the hospital in V-fib cardiac arrest after an intense argument with her daughter. Return of spontaneous circulation with conversion to normal sinus rhythm was achieved after 15 minutes of effective chest compressions and defibrillator use, followed by amiodarone and norepinephrine drips, along with mechanical ventilation. Emergent coronary angiography revealed widely patent grafts with native vessel disease, unchanged from a prior angiogram several years ago. Transthoracic echocardiogram (TTE) revealed left ventricular ejection fraction (LVEF) of 15% with severe hypokinesia of the mid and apical segments consistent with TTC. Despite escalation of inotropic support with norepinephrine, dopamine and milrinone drips, hemodynamic and electrical deterioration ensued warranting a percutaneous Left Ventricular Assist Device (pLVAD). A 24-hour interval TTE revealed dramatic improvement of the LVEF to 60% with resolution of the apical ballooning. At 48 hours from admission the patient was weaned off the pLVAD and inotropic support. Later, she was extubated with excellent hemodynamic parameters, followed by complete recovery.

IMPACT/DISCUSSION: Takotsubo cardiomyopathy (TTC), or Stress cardiomyopathy, is an acute transient worsening of left ventricular (LV) systolic function secondary to catecholamine surge. The diagnosis is based primarily on typical echocardiographic criteria in absence of significant epicardial coronary stenosis. Usual presentation of TTC is chest pain, dyspnea or syncope. The typical recovery of LV function in TTC can be quick and takes about 1-4 weeks, with the fastest recorded recovery within 36 hours of the inciting event. Predictors of delayed recovery include elevated brain natriuretic peptide, elevated LV end diastolic diameter, serious comorbidities and complicated disease course.

CONCLUSION: In this case, we report an unusual presentation of severe Takotsubo cardiomyopathy as Ventricular Fibrillation cardiac arrest with an ultra-short recovery time of 24 hours. Know a fact like this, can be reassuring for the patient's family that as Takotsubo cardiomyopathy can develop very quickly, it can resolve and heals quickly too with supportive management, even in few hours. Like in our patient, who had full recovery of the ventricular function in less than 24 hours, confirmed by follow up an echocardiogram findings.

TAP IT OUT: A CASE OF SPONTANEOUS BACTERIAL PERITONITIS IN CARDIAC ASCITES

Karen Jong. Emory University, Atlanta, GA. (Control ID #3184636)

LEARNING OBJECTIVE #1: Diagnose cardiac ascites and distinguish from other types of ascites.

LEARNING OBJECTIVE #2: Recognize which patients with cardiac ascites are at higher risk for spontaneous bacterial peritonitis

CASE: 33 year old female with history of cor pulmonale, HIV, Clostridium difficile infection, and ESRD presented with fever, abdominal pain, and distention for five days. She was compliant with antiretroviral therapy for HIV and three times weekly hemodialysis. Exam revealed abdominal distention and diffuse tenderness. CT abdomen demonstrated moderate abdominopelvic ascites but a normal appearing liver. Liver ultrasound was unremarkable. Diagnostic paracentesis revealed ascitic fluid with 10,350 white blood cells with 87% neutrophils, SAAG of 1.4 g/dL and total protein of 4.3g/dL. She was diagnosed with ascites due to right-sided heart failure complicated by spontaneous bacterial peritonitis.

IMPACT/DISCUSSION: Congestive hepatopathy is a complication of heart failure, occurring in 15-65% of patients with significant heart failure. Any condition causing right-sided heart failure will increase central venous hypertension and lead to portal hypertension. Tricuspid regurgitation in particular can lead to severe congestion because right ventricular pressures are transmitted directly into the hepatic veins. Cardiac ascites only accounts for 3% of ascites as the majority of cases are due to cirrhosis (81%) and malignancy (10%). Cardiac ascites is diagnosed by ascitic fluid with SAAG of 1.1 g/dL or greater with an ascitic fluid total protein level of 2.5g/dL or greater. This is in contrast to cirrhotic ascites, which has ascitic total protein level less than 2.5g/dL, and also nephrogenic ascites, which has a SAAG of <1.1 g/dL. Patients with cirrhosis have known predisposing factors to spontaneous bacterial peritonitis (SBP): extra-intestinal dissemination of microbes from gastrointestinal abnormalities and decreased endogenous antimicrobial activity of cirrhotic ascites fluid. SBP is less common in patients with cardiac ascites, as they do not share these predisposing factors. In this patient, history of C diff infection may have enabled bacterial gut translocation leading to SBP. This case is a reminder that ascites occurs in conditions other than cirrhosis, and should be evaluated with careful physical exam and/or bedside ultrasound when patients with heart failure come in with abdominal pain. While less common, spontaneous bacterial peritonitis can arise as a complication of cardiac ascites, and history of intra-abdominal infections should raise concern for SBP in cardiac ascites in the appropriate clinical scenario. There are several case reports in the literature, but more remains to be known about epidemiology, risk factors, and guidelines for diagnosis and treatment of SBP in cardiac ascites.

CONCLUSION: Ascites occurs in conditions other than cirrhosis and metastatic disease. Consider diagnostic paracentesis in patients with abdominal pain and cardiac ascites.

TB OR NOT TB: THAT IS THE QUESTION

Amalia Aldredge¹; Robin Klein². ¹Emory University, Atlanta, GA; ²Emory, Atlanta, GA. (Control ID #3185251)

LEARNING OBJECTIVE #1: Create a differential for a miliary pattern seen on chest imaging

LEARNING OBJECTIVE #2: Recognize the diagnostic importance of tissue for in an immunocompromised patient with fever of unknown origin

CASE: A 42-year-old Hispanic man presented with three months of fevers, night sweats, weight loss, headache, shortness of breath, productive cough, and abdominal pain. Past medical history was notable for recent diagnoses of AIDS and diabetes mellitus, for which he was taking Bactrim and metformin. He was originally from El Salvador, and had spent significant periods of time all over the United States, mostly in Texas, Colorado, and Georgia. On presentation, he was febrile, tachycardic, and hypotensive. Physical exam was notable for bibasilar crackles and a tender, hyperpigmented papule over the shin. CT Head and MRI Brain were unremarkable. CT Chest showed diffuse small nodules with apical predominance, lymphadenopathy, and bilateral pulmonary effusions. He underwent lumbar puncture, which revealed mild pleocytosis with lymphocyte predominance, but was otherwise normal. Given the miliary appearance on his chest imaging and his history, he was empirically started on rifabutin, isoniazid, pyrazinamide, ethambutol, and liposomal amphotericin B. AFB sputa, bronchoscopy, and blood cultures were negative. MTB-PCR of the sputum culture was negative. QuantiFERON gold and tuberculin skin test were negative. *Histoplasma* and *Blastomycetes* antibodies were negative. *Coccidioides* antibody was positive and antigen was negative. Thoracentesis and transbronchial biopsy were attempted and unsuccessful. He remained febrile and ultimately underwent excisional axillary lymph node biopsy, which showed spherules. His fungal tissue culture was positive for *Coccidioides spp*. He completed two weeks of amphotericin induction therapy, and was then transitioned to suppressive fluconazole therapy with improvement in his symptoms. Two weeks after discharge, repeat imaging showed improvement of his lung lesions.

IMPACT/DISCUSSION: A miliary pattern on chest imaging is often associated with tuberculosis, although there is a broader differential for this radiographic finding. Miliary nodules represent lymphohematogenous dissemination of a disease process, and are significantly more common in immunocompromised individuals. Generally, the differential includes infection (tuberculosis, fungal, or varicella), metastases (often of the thyroid, kidney, breast, or sarcoma), sarcoidosis, or pneumoconiosis. As in this case, despite a clear source, an underlying diagnosis of the cause of fever of unknown origin is often delayed and may be improved with early consideration of biopsy for a tissue diagnosis.

CONCLUSION: - A miliary pattern on chest imaging can be seen in infection (including tuberculosis, fungal, or varicella), metastases, sarcoidosis, or pneumoconiosis - A tissue biopsy is often essential for diagnosis in an immunocompromised patient with fever of unknown origin

TB OR NOT TB: USE OF ADA IN DIAGNOSING TUBERCULOUS VS. LYMPHOMATOUS EFFUSION

Christian Frese; Priyanka Ballal; Michael Schwartz. Boston Medical Center, Boston, MA. (Control ID #3178689)

LEARNING OBJECTIVE #1: Review the differential diagnosis of a pleural effusion in a patient with newly-diagnosed HIV

LEARNING OBJECTIVE #2: Identify the pitfalls of using ADA to distinguish between tuberculous and malignant effusions

CASE: A previously healthy 54-year old man who had recently immigrated from Uganda presented with 3 weeks of pleuritic chest pain, dyspnea, and B-symptoms. He denied productive cough, high-risk sexual activity and intravenous drug use. Examination revealed a cachectic man with decreased breath sounds and dullness in the left lung fields. A chest x-ray and subsequent chest CT revealed a large left-sided pleural effusion with right mediastinal shift and hilar lymphadenopathy. He was subsequently found to be HIV positive with a CD4 count of 164. He underwent a thoracentesis with chest tube insertion and pleural fluid analysis revealed an exudate with lymphocytic predominance, negative cytology and culture, and adenosine deaminase (ADA) of 59.6 U/L (normal <9.2 U/L). A Quantiferon Gold was positive but all mycobacterial studies including AFB smear, mycobacterial cultures, and tuberculosis PCR of the pleural fluid and induced sputum were negative. Based on the clinical history, positive Quantiferon Gold, and elevated ADA, the leading diagnosis was pleural tuberculosis, but lymphoma could not be definitively excluded. Due to the technical challenges of an excisional biopsy, the decision was made to treat empirically with 4 drug anti-tubercular therapy and monitor the clinical response. While a follow-up CT scan showed resolution of the pleural effusion, there were multiple pleural-based lesions with central cavitation and persistent lymphadenopathy. Due to concern for missed malignancy, a pleural biopsy was obtained which was negative for lymphoma, Kaposi sarcoma, and bacterial, mycobacterial, or fungal infections. Pathology revealed non-caseating granulomatous inflammation. The patient has since completed 8 weeks of four-drug directly observed therapy and is currently on isoniazid and rifabutin with excellent response. He was also started on anti-retroviral therapy and currently has an undetectable viral load.

IMPACT/DISCUSSION: This case shows the complexity of diagnosing extra-pulmonary TB in the absence of positive cultures. Additionally, while ADA is an important tool for diagnosing tuberculosis when cytology and culture are negative, it is important to note that lymphoma can also cause elevated ADA values.

CONCLUSION: Extra-pulmonary TB and lymphoma are both common in immunocompromised patients and can present with similar signs and symptoms. It is important to perform a thorough work-up for such presentations to ensure timely initiation of the appropriate therapy. While tuberculosis almost always causes an elevated ADA, it is important to note that the same can be true for lymphomatous effusions, which in rare cases can exceed 250 U/L. When the diagnosis is equivocal, ADA should be interpreted with caution and a biopsy may be needed to confirm the diagnosis.

TEARING CHEST PAIN IN A PREGNANT WOMAN WHILE WATCHING OLYMPIC GAMES.

Yu Yaegashi¹; Mitsunori Iwase¹; Hiroshi Miyake². ¹TOYOTA memorial hospital, Toyota, Japan; ²TOYOTA Memorial Hospital, Aichi, Japan. (Control ID #3182620)

LEARNING OBJECTIVE #1: Recognize spontaneous coronary artery dissection as a potential cause of chest pain in pregnant women.

LEARNING OBJECTIVE #2: Recognize clinical features and management of spontaneous coronary artery dissection.

CASE: The patient is a 34 year-old pregnant woman, non-smoker without cardiovascular risk factors. Her pregnancy had been uneventful until one day prior to her due date, when she developed sudden-onset severe "tearing" chest pain while watching the Olympic games on TV. She called emergency medical service and presented to our hospital. Initial

electrocardiogram showed anterior ST-segment elevation. Emergent coronary angiography revealed diffuse 90% stenosis of proximal to mid segments of the left anterior descending coronary artery and total occlusion of the second diagonal branch. Intravascular ultrasound revealed a large intramural hematoma compressing the true lumen, consistent with spontaneous coronary artery dissection (SCAD). Primary percutaneous coronary intervention was performed with balloon angioplasty to left anterior descending artery and the second diagonal branch, resulting in good antegrade coronary flow. We placed intra-aortic balloon pump to provide hemodynamic support during cesarean section, which was successfully performed on the following day. Follow-up coronary angiogram was performed one week later, which showed almost complete resolution of intramural hematoma. Another follow-up coronary angiogram three months later showed complete resolution of intramural hematoma.

IMPACT/DISCUSSION: SCAD is defined as a non-traumatic and non-iatrogenic separation of the layers of the coronary arterial wall by which a false lumen is formed. SCAD affects women in more than 90% of cases and is most prevalent in young women. Pregnancy is one of the key risk factors of SCAD. The large majority of pregnancy-related SCAD occur in the first postpartum month, especially in the first week. Although SCAD is increasingly recognized as an important entity of myocardial infarction in young women, it remains a challenge to promptly diagnose SCAD, especially when presenting without obvious electrocardiographic changes. Prompt recognition and appropriate intervention are essential to achieve favorable maternal and child outcomes. Thus, it is important to have a high index of suspicion for SCAD when encountering a pregnant woman presenting with chest pain. The optimal management of SCAD remains undetermined. Percutaneous coronary intervention for SCAD has a significantly low procedural success rate and high rate of complications. Thus, a conservative approach is preferred. Urgent intervention may still be indicated in cases of ongoing chest pain or persistent ST-elevation.

CONCLUSION: We experienced a young pregnant woman who developed SCAD and was successfully treated with balloon angioplasty, resulting in favorable maternal and child outcomes. It is important to have a high index of suspicion for SCAD in pregnant women presenting with sudden chest pain.

TERRIBLE THORACIC TRANSIT: ACUTE KIDNEY INFARCTION DUE TO A PARADOXICAL EMBOLUS

Ye Aung¹; Holli T. Sadler². ¹Dell Medical School at the University of Texas Austin, Austin, TX; ²Dell Medical School, Austin, TX. (Control ID #3183360)

LEARNING OBJECTIVE #1: Recognize unusual complications of an unprovoked Pulmonary Embolism.

CASE: The patient is a 38 year old African American man with a PMH of cocaine abuse and asthma who presented to the ED due to a witnessed episode of syncope and altered mental status. Upon arrival he was hypoxic, hypotensive and agitated. On physical exam, the Patient had clear lung sounds bilaterally and intact pulses. Severe left flank tenderness was noted. Labs were remarkable for an elevated serum creatinine of 1.3mg/dL compared to a baseline of 0.8mg/dL. Urinalysis revealed mild proteinuria and microscopic hematuria. Urine toxicology was positive for cocaine. Due to concern for pulmonary embolus, computed tomography angiogram of the chest was ordered, which showed massive bilateral PE. The patient was also found to have no perfusion of the Left Kidney. CT head was negative for acute CVA or lesion. Following fluid resuscitation the patient achieved hemodynamic stability and no thrombolysis was indicated. The

patient was started on heparin drip and his clinical and mental status improved and returned to his baseline within a few hours. Further workup was ordered to determine the cause of left kidney ischemia. Venous ultrasound of the lower extremity showed a large right lower extremity deep vein thrombosis. A nuclear perfusion study showed almost no perfusion to left kidney so function could not be salvaged via endovascular procedure. The patient was discharged on rivoroxaban indefinitely and he was advised to quit cocaine use and smoking. Outpatient hypercoagulability workup is pending.

IMPACT/DISCUSSION: We believe that this patient's acute kidney failure was caused by his large deep vein thrombus in his right lower extremity entering the systemic circulation via his trivial right to left atrial shunt and causing an infarction of the left renal artery. Although the patient's right to left shunt under normal physiologic circumstances is too small to allow a thrombus to pass, we hypothesize that in the context of a massive pulmonary embolism, a temporary increase in pulmonary pressure would cause enlargement of the shunt and allow the passage of a clot. Paradoxical emboli leading to acute unilateral kidney failure is a clinically rare event. This is primarily because there is a requirement for both the existence of a patent cardiac shunt as well as a hyper-coagulable state. We have found one similar case in literature. This case demonstrates the importance of keeping a broad differential and that mild or silent physiologic abnormalities can cause significant morbidity in unique circumstances. (1). R. Schmitt, M. Westhoff-Bleck, H. Haller, A.D. Wagner; Paradoxical renal embolism in a patient with congenital cardiac malformation, *QJM: An International Journal of Medicine*, Volume 104, Issue 10, 1 October 2011

CONCLUSION: In any patient with risk factors for hypercoagulability such as cocaine use and unexplained kidney injury, paradoxical embolism is a rare yet important possibility that must be considered.

TERRIFIED OF INSULIN: USING A PATIENT-CENTERED, MULTI-DISCIPLINARY APPROACH TO TREAT A CASE OF SEVERE TYPE 2 DIABETES

Michael S. Tzeng; Jill Allenbaugh. Temple University, Philadelphia, PA. (Control ID #3184867)

LEARNING OBJECTIVE #1: Recognize clinical signs and lab evidence of severe, catabolic diabetes

LEARNING OBJECTIVE #2: Utilize a patient-centered, multi-disciplinary approach to improve patient outcomes in the outpatient setting

CASE: A 59 year-old female with type 2 diabetes, hypertension, hyperlipidemia, and obesity presented to the outpatient clinic complaining of worsening fatigue, thirst, urinary frequency, unintentional weight loss, and intermittent abdominal pain. She had lost 15 pounds over six months, and her glucose was 408 mg/dL. Labs revealed a HbA1c of 12.3% and microalbuminuria, concerning for severe, catabolic diabetes with early evidence of nephropathy. Prior treatment had been complicated by difficulty with lifestyle changes and intolerance of oral diabetic agents. She repeatedly refused subcutaneous insulin, citing a fear of side effects, terror of using needles, and a sentiment that using insulin meant personal failure. After a discussion about alternative therapy, she chose to initiate dulaglutide injections based on its side effect profile and lower frequency of injections. Since she was terrified of needles, she agreed to have her medicine administered by staff during weekly pharmacy clinic visits. Additionally, she was enrolled in diabetic education classes, scheduled for nutritionist visits and encouraged to sign up for a fresh food initiative. Over the next few months, she reported that diabetic education class and nutritionist visits provided her with the knowledge to make healthier food choices. With skills learned from

pharmacy clinic, she began closely documenting her glucoses and noticed when certain foods made her sugars spike. Additionally, she began administering her own dulaglutide in clinic and soon graduated to self-administration at home. With her newly acquired skills and continued support, she eventually reported a resolution in her symptoms. Repeat labs five months later revealed a dramatically improved A1c at goal: 6.4%.

IMPACT/DISCUSSION: In patients with severe diabetes, the failure of lifestyle changes and oral therapy commonly prompts initiation of subcutaneous insulin regimens. However, treatment may be limited by patient preference and poor adherence. This patient was offered an injectable non-insulin medication combined with multi-disciplinary care, diabetic education, and better access to healthy foods, altogether culminating in an A1c at goal and resolution of symptoms.

CONCLUSION: Successful treatment of severe diabetes in the outpatient setting requires not only medical knowledge, but also shared decision making, taking into consideration patient preferences and social determinants of health. Improving patient access to resources and multi-disciplinary care can ultimately prevent the development of hyperglycemic crises or vascular complications.

THAT COUGH SAVED YOUR LIFE: OCULAR MANIFESTATIONS OF ACUTE PROMYELOCYTIC LEUKEMIA

Naomi Habib³; suman misra¹; Santi Karnam¹; Jaya Raj². ¹St. Joseph's Hospital and Medical Center, Phoenix, AZ; ²St. Joseph's Hospital, Phoenix, AZ; ³St Joseph's Hospital and Medical Center/Creighton University Medical School, Phoenix, AZ. (Control ID #3186545)

LEARNING OBJECTIVE #1: To identify early signs and symptoms of acute promyelocytic leukemia (APL)

LEARNING OBJECTIVE #2: To recognize the propensity of APL for causing disseminated intravascular coagulation (DIC) and fatal, systemic hemorrhages

CASE: A 58-year-old woman with a history of an intracranial aneurysm presented to her ophthalmologist after 1 day of bilateral vision loss following 1 month of worsening floaters. She was then sent to our ED for imaging due to concern for Terson syndrome. Her history includes hypertension, a congenital paraclinoid internal carotid artery aneurysm and a bout of severe pneumonia treated one month ago. Her vitals were normal and stable (T:36.7C, HR: 94, RR:16, BP:144/69). Ophthalmologic exam showed bilateral pre-retinal and intra-retinal hemorrhages with heme covering the fovea in the left eye. PERLLA, EOMI. The rest of her exam was normal. A CBC showed WBC: 0.5, Hgb: 4.3, Hct: 12.7, Plt: 47. BMP was normal. CT angiogram showed an intact 2x3mm paraclinoid ICA aneurysm. MRI of the brain and orbits was grossly negative. A peripheral blood smear showed pancytopenia with >20% blasts and a bone marrow biopsy showed virtually 100% cellular bone marrow with >70% blasts. FISH analysis detected the PML-RARalpha translocation which is pathognomonic for APL. She was immediately transfused with PRBCs and started on steroids, ATRA and arsenic. On day 16, she developed dyspnea and leukocytosis. CXR showed evidence of pulmonary edema, and the ATRA was stopped due to concern for retinoic acid/differentiation syndrome. Her leukocyte count normalized and she resumed ATRA therapy with no complications through the rest of her hospital stay. Patient is in remission at 10mo after initial presentation and showed cleared bilateral retinal hemorrhages.

IMPACT/DISCUSSION: The initial presentation of APL is similar to those of patients with other forms of acute myeloid leukemia: including fatigue, easy bruising and epistaxis. However, APL is unique in that it can manifest as hemorrhages and/or DIC in up to 61% of patients. Early

initiation of an ATRA-based regimen is necessary to prevent death from hemorrhagic complications. When first described in 1957, no treatment existed, and patients often died due to acute hemorrhage, with a median survival under 7 days. Even now, early mortality remains a concern; the incidence has only decreased from 22.21% in the 1990s to 17.5%. In our case, the patient presented with ocular hemorrhage; a known complication of APL and is reported at a rate of 42% of leukemic ocular findings. However, the incidence of retinal hemorrhage as a solitary finding pointing to the diagnosis of APL is rare, with only 3 cases reported in the literature. We believe that her previous pneumonia, which triggered her severe cough, had increased her propensity for retinal hemorrhage and ultimately led to the diagnosis of APL.

CONCLUSION: Our case demonstrates that maintenance of a high suspicion for APL in the setting of pancytopenia and hemorrhage is paramount, and indeed can help to save a patient's life.

THE ABC'S OF ACUTE VIRAL HEPATITIS IN A HOMELESS MAN WHO INJECTS DRUGS

Ryan Bonner¹; Jessica Taylor². ¹Boston Medical Center, Boston, MA;

²Boston University/Boston Medical Center, Boston, MA. (Control ID #3162846)

LEARNING OBJECTIVE #1: Identify the risk for acute hepatitis A among patients experiencing homelessness and/or substance use disorders.

LEARNING OBJECTIVE #2: Offer HAV vaccination to patients with epidemiological risk.

CASE: A 32-year-old man with severe opioid use disorder and homelessness presented to an opioid urgent care clinic. He endorsed receptive syringe sharing. Labs showed mild transaminitis (AST 53 U/L, ALT 84 U/L, total bilirubin 0.3 mg/dL) and negative results for HCV antibody, hepatitis A (HAV) IgG, and hepatitis B (HBV) surface antigen, surface antibody, and core antibody. The patient was started on buprenorphine/naloxone. One week later, he endorsed several days of nausea, vomiting, malaise, and fatigue that began after sustaining a blistering sunburn. Exam showed partial-thickness burns of sun exposed areas, diffuse abdominal tenderness, and no jaundice. The patient was counseled on management of severe sunburn; because of the mild transaminitis, he was also evaluated for acute viral hepatitis. Labs showed a significant rise in AST (2,079 U/L), ALT (2,727 U/L), and total bilirubin (5.2 mg/dL, 4.1 direct). INR was 1.57. HCV RNA and HBV DNA were not detected, and his HAV IgM antibody returned positive, consistent with acute HAV. The patient was admitted for supportive care. His AST, ALT, and INR down-trended, and he was discharged on hospital day 5 once cleared to return to his shelter by the Department of Public Health. Follow up labs demonstrated further improvement in his liver enzymes and synthetic function.

IMPACT/DISCUSSION: This case highlights the importance of provider awareness of local epidemiological risk and the need for intensified HAV prevention efforts, including vaccination, among people who are homeless and/or inject drugs.

CONCLUSION: People who inject drugs (PWID) are at high risk of viral hepatitis. Testing, prevention, and treatment efforts have focused on HBV and HCV, but recent outbreaks of HAV affecting homeless people and PWID have been described in at least 12 states. Unlike HBV and HCV, which can be transmitted via shared injection, insufflation equipment, or sexual intercourse, HAV is transmitted via the fecal-oral route, and the risk of transmission in communal settings like shelters is high. Nonspecific constitutional or GI symptoms and transaminitis should raise suspicion for acute HAV in individuals affected by substance use disorders or housing

insecurity; providers in regions impacted by HAV outbreaks should have a low threshold to test for acute infection with HAV IgM antibody. The management of acute HAV is supportive. Fulminant liver failure is rare in patients without underlying liver disease, but hospitalization and quarantine of patients living in communal settings are often needed. As of November 2, 2018, 84% of 141 total outbreak-related cases in Massachusetts have resulted in hospitalization. Overall, PWID should be counseled on strategies to prevent all types of viral hepatitis, including safe injection practices, vaccination for HAV and HBV, food safety, and hand washing.

THE BLOODY VICE OF BRODIFACOUM AND SPICE

Alexandra Rezazadeh; Kristi Maso; Marium Khan. Medical College of Wisconsin, Wauwatosa, WI. (Control ID #3175227)

LEARNING OBJECTIVE #1: Recognize the bleeding diathesis secondary to brodifacoum-associated synthetic cannabinoid (SCB) use.

LEARNING OBJECTIVE #2: Collaborate with interdisciplinary hospital and community teams to treat and arrange follow-up for patients with SCB-associated cogulopathy.

CASE: A 23-year-old African American male presented with a 3-day history of right flank pain, hematuria, and emesis. He reported SCB use 3 days prior. Vitals were stable. Exam showed right CVA tenderness. Labs revealed hemoglobin of 11.7 g/dL, platelets of 105,000, INR of > 10, and urinalysis with 3+ blood. CT abdomen and pelvis with contrast showed a right retroperitoneal hematoma. He was admitted to the ICU and given IV Vitamin K and continued on oral Vitamin K per Wisconsin Poison Control orders. ICU stay was complicated by expanding hematoma requiring resuscitation with multiple units of fresh frozen plasma, blood transfusions, and a total of 470 mg of Vitamin K over 4 days, after which his INR was 1.6. Vascular surgery was consulted but he required no intervention. Though stable for discharge, due to Vitamin K shortage and his lack of insurance, the regimen cost over \$20,000. Discharge was delayed one day until pharmacy and social work could secure charity funds. He was given a 30-day supply of Vitamin K for \$5.64 with an arranged clinic visit 4 days later. He followed up and was put on a Vitamin K taper with a dose decrease of 25% each week for 4 weeks.

IMPACT/DISCUSSION: SCBs (also called 'Spice,' 'K2') are mind-altering chemicals sprayed on plant material to be smoked or sold as liquids to be vaporized and inhaled. They are chemically related to substances in plant-based marijuana. Their use is preferred due to lower cost and prosecution evasion due to undetectability in drug screens. SCBs have higher binding affinity for cannabinoid receptors than delta-tetrahydrocannabinol, the active component of traditional marijuana. In the spring of 2018, the CDC reported that some SCBs were being laced with brodifacoum, a 'superwarfarin' that binds Vitamin K epoxide reductase more strongly than warfarin, giving it a longer elimination half-life. Use of brodifacoum with SCBs is multifactorial: sources cite intentional addition to prolong SCB effects and unintentional toxicity due to its use as a rodenticide. In Wisconsin in 2018, 67 cases of brodifacoum-laced SCB use were confirmed, including one death. Recent studies describe similar outbreaks. This case reiterates those studies' findings but is unique in highlighting the public health impact. The high cost and shortage of treatment not only hinders discharge but also prevents patients from receiving proper therapy. Interdisciplinary teams were vital to facilitate affordable therapy and follow-up.

CONCLUSION: SCBs are increasing in use due to their affordability and undetectability in drug screens. Recognition of the toxicity requires a high index of suspicion. Failure to diagnose may result in significant adverse outcomes. Proper treatment and follow-up requires strong interdisciplinary cooperation.

THE CASE OF THE GROWING SNAKE AND THUMPING HEART

Iniya Rajendran¹; Thomas W. Barber². ¹Boston Medical Center, Boston, MA; ²Boston University School of Medicine, South Boston, MA. (Control ID #3185845)

LEARNING OBJECTIVE #1: Recognize the manifestation of high-output heart failure and that an arteriovenous fistula is as a rare but reversible cause.

LEARNING OBJECTIVE #2: Recognize that patient word choices are an important aid in diagnosis.

CASE: Ms N is a 66-year old renal transplant recipient with a history of heart failure with preserved ejection fraction (HFpEF), atrial fibrillation and a patent arteriovenous fistula (AVF) for hemodialysis. She presented to primary care clinic with lower extremity and abdominal swelling despite increasing doses of furosemide. She also reported that her AVF, located in the left forearm, was a "growing snake". Imaging of the abdomen showed "a nodular contour to the liver consistent with cirrhosis" prompting a GI referral and several encounters for therapeutic paracentesis. Ascitic fluid was chylous appearing with a serum albumin/ascites ratio of 1.1. During her clinical course, she constantly reported a "thumping" heart sound which was worsening. New symptoms of fatigue and shortness of breath began to develop. An echocardiogram showed abnormal right ventricular function and morphology and right heart catheterization showed a pulmonary capillary wedge pressure <15. Finally, she was diagnosed with pulmonary hypertension and high output heart failure secondary to the large, high flow, AVF. Within three months of ligation of the fistula, she had complete resolution of all symptoms.

IMPACT/DISCUSSION: This is a case of an eloquent historian who developed an uncommon type of HF. Causes of high output HF are broadly categorized as follows (1) increased metabolism leading to an increase in demand for blood and (2) low systemic resistance leading to increased flow into venous circulation such as an AVF. A single center study described the etiologies of high output HF to be obesity (31%), liver disease (23%), arteriovenous shunts (23%). There is no current evidence for ligation of AVF and is generally maintained in case of return to dialysis and prevention of hemodynamic changes post-transplantation. Decisions should be case-based and in high flow AVFs, ligation is warranted. This case serves as a reminder that an answer to a diagnostic dilemma is often right in front of our us i.e. patients initial report of a growing AVF should be confirmed by examination and Doppler ultrasound. While clinicians appropriately chased a clue (liver findings on the CT scan), it turned out to be the consequence (liver congestion secondary to heart failure) and not the cause. The onomatopoeic word "thump" she repeatedly used through the course is a testament to the patient's subconscious self-awareness of a hardworking heart.

CONCLUSION: An iatrogenic cause of high output heart failure which needs early recognition is the non-removal of enlarging AVFs created for hemodialysis. Active listening and addressing patient concerns may help solve diagnostic dilemmas quicker.

THE CLOT THICKENS: CEREBRAL VEIN THROMBOSIS IN A PATIENT WITH HIV/AIDS FOLLOWING MENINGITIS

Dylan Atchley; John Hwang. New York University, New York, NY. (Control ID #3166582)

LEARNING OBJECTIVE #1: Recognize the risk factors and clinical features of cerebral vein thrombosis

LEARNING OBJECTIVE #2: Manage cerebral vein thrombosis and its associated sequelae

CASE: A 26-year-old woman with untreated HIV/AIDS and a CD4 count of 54 presented with three days of fever, confusion, and ear pain, and was found

to have pneumococcal meningitis and bacteremia secondary to suppurative otomastoiditis. Myringotomy was performed, and vancomycin, ceftriaxone, and dexamethasone were administered. She improved rapidly and started antiretroviral therapy on hospital day five. However, ten days into her admission, she developed fluctuating sensory loss and weakness of her right side, with sparing of her face. A non-contrast head CT was initially read as normal, but MRI/MRV hours later revealed extensive cerebral vein thrombosis (CVT) involving the superior sagittal and lateral transverse sinuses extending to the internal jugular vein. Tonic-clonic seizures developed shortly after. Heparin, levetiracetam, and phenytoin were started, with resolution of her seizures and neurologic deficits. She was discharged home on enoxaparin and recovered fully.

IMPACT/DISCUSSION: We initially overlooked the possibility of CVT in this patient, exposing several deficits in our illness script for this entity. CVT has a highly variable clinical presentation, usually produces only subtle findings on early unenhanced CT, and can complicate bacterial meningitis even late in its course. Timely diagnosis requires recognition of its risk factors and characteristic findings.

CONCLUSION: A wide variety of underlying disorders predispose to CVT. A systemic prothrombotic state is often present, whether from a genetic thrombophilia or an acquired condition such as malignancy, rheumatologic disease, pregnancy, or oral contraceptive use. Mechanical insults from head trauma, local tumor, or intracranial infection are also common causes; for example, CVT reportedly complicates 7-9% of cases of pneumococcal meningitis. Perhaps owing to this myriad of causes, the clinical manifestations of CVT are highly variable: headache is most frequent, while seizures, focal neurologic syndromes, and encephalopathy are also commonly observed—but none of these are invariably present. A waxing-waning pattern of stroke-like symptoms that do not conform to a stroke distribution, as seen in this case, is a characteristic presentation. Initial treatment is preferably low-molecular weight heparin. In the absence of definitive studies, anticoagulation is typically continued for at least six months, but should be individualized based on the patient's thrombotic risk. Warfarin is an acceptable choice, though this patient's cobicistat-containing antiretroviral regimen precluded its use; direct oral anticoagulants, meanwhile, have been insufficiently studied. While we considered the possibility that immune reconstitution may have contributed to this patient's CVT, in the context of severe bacterial infection, early initiation of ART is currently standard of care.

THE CLUE IN THE CULTURE: FUSOBACTERIUM LUNG INFECTION LEADING TO DIAGNOSIS OF COLORECTAL ADENOCARCINOMA

Rebecca Berger. Weill Cornell Medicine, New York, NY. (Control ID #3187040)

LEARNING OBJECTIVE #1: Recognize the association between fusobacterium nucleatum and colorectal cancer

CASE: A 79 year old retired physician presented with 3 weeks of progressive fatigue, dry cough, dyspnea, and dark stools. He had a mass protruding from the right chest wall and decreased breath sounds in the R lung. Hemoglobin was 10.8 g/dL, ferritin 246 ng/mL, transferrin saturation 9%. Chest CT showed multiple large peripheral lung opacities, a right infrahilar mass, and a low density rim-enhancing collection invading the right chest wall, concerning for metastatic lung cancer. Fine needle aspiration and core biopsy of the chest wall mass revealed no malignant cells. Bronchoscopy with transbronchial biopsy of the right infrahilar mass also found no evidence of malignancy. The fluid aspirated from the chest wall mass subsequently grew fusobacterium nucleatum. Colonoscopy revealed a 3cm infiltrating, ulcerating

mass in the colon; pathology confirmed colorectal adenocarcinoma. The patient was diagnosed with a fusobacterium lung infection with empyema necessitatis associated with colorectal adenocarcinoma. He was treated with several weeks of ertapenem; repeat CT chest showed near resolution in the intrapulmonary masses and chest wall collection. MRI of the pelvis had no evidence of wall invasion or metastasis. He underwent laparoscopic-assisted anterior resection of the colorectal cancer and ultimately found to have stage IIIB (T3N1cMx) colorectal cancer. He opted to forego adjuvant systemic chemotherapy and is doing well one year after initial presentation with no evidence of recurrence.

IMPACT/DISCUSSION: Fusobacterium nucleatum is a gram-negative obligate anaerobic bacterium that is prevalent in the oral cavity. Several studies in recent years have demonstrated a strong association between fusobacterium nucleatum and human colon adenomas and carcinomas, including some hypotheses that fusobacterium nucleatum promotes the development of colorectal cancer. Existing literature highlights the microbiological overrepresentation of this anaerobe in colorectal adenomas and carcinomas, with no prior reports of clinical fusobacterium infections in patients with colorectal cancer. After the fusobacterium grew in culture, it was on the basis of this literature, with new iron deficiency anemia and dark stools, that the colonoscopy was pursued and the diagnosis of colorectal carcinoma was made. This case represents the first known in the literature in which a clinically evident infection with fusobacterium nucleatum was associated with a concurrent diagnosis of colorectal cancer.

CONCLUSION: When faced with an unexpected or rare finding, in this case an anaerobic lung abscess, availability of the literature can help identify associations that can lead to the ultimate diagnosis.

THE CONFUSING TRUTH ABOUT CEREBRAL AMYLOID ANGIOPATHY

Shaunak Mulani; Christopher Little; Andres Lopez; Margaret C. Lo. University of Florida College of Medicine, Gainesville, FL. (Control ID #3186026)

LEARNING OBJECTIVE #1: Identify the clinical features and classic radiographic findings of CAAI in elderly patients

LEARNING OBJECTIVE #2: Diagnose and manage CAAI as a reversible cause of dementia

CASE: A 75-year-old female with chronic Bell's palsy presented with new-onset worsening visual hallucinations and delusions with behavioral and cognitive changes for 1 month. Vitals and neurologic exam were normal on admission. Psychiatric exam noted visual hallucinations, waxing-waning orientation to situation and inappropriate response to questions. Labs revealed elevated ESR and CRP. Brain CT from a recent hospitalization incidentally found frontal, left occipital and right pontine vasogenic edema. Brain MRI showed hyperintensities in left frontal lobe concerning for inflammatory amyloid angiopathy. Repeat brain MRI at admission showed increasing areas of edema and abnormal FLAIR signal in left parietal lobe with new microhemorrhages in right frontal and parietal lobe, concerning for inflammatory amyloid angiopathy. Lumbar puncture revealed positive oligoclonal bands but no infection or malignancy. Family declined a brain biopsy. Patient was treated for cerebral amyloid angiopathy related inflammation (CAAI) with 5 days of IV solumedrol and a steroid taper. Her symptoms resolved with this regimen. Brain MRI three weeks later showed resolution of the supratentorial edema, improved hyperdensity in frontal lobes, and stable microhemorrhages.

IMPACT/DISCUSSION: Cognitive impairment and dementia are common presentations in the elderly, often attributed to age-related changes. This rare case of CAAI teaches clinicians the risk of pattern recognition and anchoring

in the diagnostic evaluation of dementia. CAAI is a rare but known cause of reversible encephalopathy in the elderly and can mimic senile or Alzheimer's dementia. Its prevalence in the elderly is due to deposition of beta-amyloid protein in vessels of the cerebral cortex. Common presenting features are acute/subacute encephalopathy, headache, seizures, and neuropsychiatric signs. Labs reveal elevated ESR and CSF pleocytosis. Risk factors include elderly age and presence of ApoE E4/E4 genotype. Diagnosis is made clinically and by MRI which shows classic findings of multiple microbleeds, confluent white matter hyperintensity, large areas of inflammation, or edema. Stereotactic brain biopsy provides definitive diagnosis but is not required unless MRI is unamenable. Literature reports good response to brief courses of corticosteroid and immunosuppressive agents e.g. cyclophosphamide. As CAAI is an easily reversible disorder, early recognition and prompt diagnosis can prevent further morbidity.

CONCLUSION: CAAI can be diagnosed by clinical presentation and classic MRI findings, thus avoiding the need for invasive brain biopsy. CAAI can present with progressive cognitive decline and neuropsychiatric symptoms in the elderly and can mimic age-related dementia; however, it is easily reversible with immunosuppressive treatment. Prompt recognition and early diagnosis of CAAI are imperative.

THE COST OF COFFEE: RENAL FAILURE IN CENTRAL AMERICA

Emily R. Insetta. Johns Hopkins Bayview Medical Center, Baltimore, MD; Johns Hopkins Community Physicians - Howard County General Hospital, Columbia, MD. (Control ID #3186401)

LEARNING OBJECTIVE #1: To increase awareness of Mesoamerican nephropathy.

LEARNING OBJECTIVE #2: To describe proposed mechanisms of Mesoamerican nephropathy.

CASE: A 29 year old man from Honduras with no medical history presented to the ER with fatigue and dyspnea that began 4 months ago but worsened over 2 weeks. He noted orthopnea and swelling. Labs showed BUN 93, Cr 9.97, potassium 3.1, uric acid 8.2, and 1+ proteinuria. One year prior, BUN was 13 and Cr was 1.47. He was well appearing, with blood pressure 163/111, jugular venous distention, and ankle edema. He took no medications or substances. During adolescence, he worked harvesting coffee in Honduras. Renal biopsy showed diffuse global glomerulosclerosis and tubulointerstitial scarring. The pathologist diagnosed malignant hypertension versus Mesoamerican nephropathy (MeN). The patient's blood pressure was not severely elevated and he had no history of severe hypertension. His social history and findings of hyperuricemia, hypokalemia, and proteinuria suggested MeN. He was started on renal replacement therapy and discharged on lifelong hemodialysis.

IMPACT/DISCUSSION: MeN is the number one cause of death in sugar cane workers in Nicaragua. It is important for internists to consider this diagnosis in vulnerable populations. From studying sugar farmers in Nicaragua, four features of MeN have emerged: it is specific to Southeast Mexico and Central America, kidney injury is not explained by another cause, young individuals (30-50 years) and men (4:1) are afflicted, and it affects farm workers in hot climates. The primary cause of injury is thought to be recurrent dehydration. This is exacerbated by nephrotoxins, especially NSAIDs, which workers use for musculoskeletal pain. Other proposed factors include toxic agrochemicals, high-fructose drinks, contaminated alcohol products, and local infections such as Leptospirosis. Renin angiotensin activation causes hyperuricemia and hypokalemia. Patients have non-nephrotic proteinuria and pathology shows tubulointerstitial disease and glomerular ischemia. MeN

progresses to end stage disease within a few years, causing death in regions without dialysis. To provide culturally competent care, the internist must recognize MeN as an important diagnosis among agricultural workers from afflicted areas. The World Bank has asserted the importance of improving working conditions in these regions. There are no official guidelines, but it may be reasonable to screen for kidney disease and aggressively treat risk factors in high risk patients.

CONCLUSION: Mesoamerican nephropathy causes renal failure in young farm workers from Mexico and Central America. Repetitive bouts of dehydration and nephrotoxic exposures are the proposed causes.

THE CREUTZ OF THE PROBLEM: RAPID CJD DEMENTIA MASKED BY ANXIETY AND INSOMNIA

Audrey Ready; Ali Shami; Maryam Hasan. Baystate Medical Center, Chicopee, MA. (Control ID #3186274)

LEARNING OBJECTIVE #1: Recognize early manifestations of Creutzfeldt-Jakob Disease (CJD) including anxiety and insomnia as presenting symptoms.

LEARNING OBJECTIVE #2: Discuss diagnostic tools for CJD, including real-time quaking-induced conversion testing (RT-QuIC).

CASE: A 67-year-old female with a history of anxiety and depression came to the clinic with a three-week history of insomnia and increased anxiety. She had returned recently from vacationing in Italy, and the symptoms were ascribed to jet lag. Over the next several weeks she exhibited erratic behavior and confusion and was eventually brought to the emergency department by concerned family. Initial evaluation revealed a middle-aged woman who was alert but very confused, exhibiting echolalia and hyperreflexia in all extremities. Evaluation including blood tests and infectious workup were negative. Magnetic resonance imaging of the brain revealed extensive diffusion abnormalities throughout the cortex of both cerebral hemispheres with the involvement of the caudate head. Video electroencephalogram (EEG) showed periodic lateralized epileptiform discharges in the left temporal region. Her cerebral spinal fluid was negative for viral or bacterial infections. In the context of her rapidly progressive dementia, CSF was also sent to check for the presence of protein 14-3-3 and RT-QuIC. She continued to decline in the hospital, eventually developing mutism; she was ultimately made comfort measures after a multidisciplinary family meeting. She passed away eleven weeks after the presentation of symptoms. Results of her testing returned with greater than 4000 pg/mL T-tau protein, positive 14-3-3 protein and positive (RT-QuIC) testing.

IMPACT/DISCUSSION: CJD is a fatal, rapidly progressive form of dementia caused by prions. However, the clinical diagnosis is challenging. Psychological disturbances such as anxiety and agitation are noted in 90% of cases and are often accompanied by hyperreflexia, myoclonus or cerebellar dysfunction. Insomnia itself has only rarely been reported as a presenting symptom in individuals with CJD. Definitive diagnosis requires brain biopsy; therefore other workup is pursued for probable diagnosis. Center for Disease Control (CDC) guidelines dictate that probable diagnosis requires one of the following: EEG with periodic sharp waves; 14-3-3 protein in CSF; or MRI with typical caudate and/or putamen abnormalities. In addition, it requires presence of two out of the following four exam findings: akinetic mutism, myoclonus, pyramidal/extrapyramidal signs, or cerebellar signs. RT-QuIC is a novel test that detects abnormally folded isoforms of prion protein in the CSF and has been shown to exhibit high sensitivity of 92% and specificity of 100% for prion disease.

CONCLUSION: This case highlights the difficult diagnosis of CJD which may be masked by other diagnoses such as mood disorders. CJD should be

strongly considered in patients with rapid and sudden cognitive decline and novel tests such as RT-QuIC can assist with the diagnosis.

THE DIFFICULT DIFFERENTIATION BETWEEN CAUSES OF INFLUENZA RELATED CARDIOMYOPATHY

Rohan B. Parikh; Krupa K. Solanki; Muhammad U. Khalid; Ritha Kartan. Western Reserve Health Education, Youngstown, OH. (Control ID #3146297)

LEARNING OBJECTIVE #1: The 2017-18 influenza season was a high severity season with an estimated 80,000 flu related deaths. Although mortality in these patients is usually due to respiratory failure, recent studies have implicated influenza in a wide spectrum of cardiovascular diseases. Acute myocardial infarction is a well known complication but myocarditis has been infrequently associated with it. We aim to heighten the awareness of acute viral myocarditis for early recognition and prompt management during seasonal episodes of influenza infection.

CASE: Patient A is an 88-year-old male with known coronary artery disease who presented with dyspnea and productive cough. Lab studies were positive for influenza A, mild kidney injury, and troponin I that trended up to 12.2 ng/mL. ECG showed normal sinus rhythm with few premature ventricular contractions. Echocardiogram showed preserved ejection fraction, grade I diastolic dysfunction, and no wall motion abnormalities. Patient B is an 88-year-old male with no significant past medical history who presented with dyspnea. Physical examination was significant for hypoxia and irregular rhythm. ECG showed atrial fibrillation. Lab studies were positive for influenza A, mild kidney injury, and troponin I that trended up to 36.6 ng/mL. Echocardiogram showed ejection fraction of 18%, grade I diastolic dysfunction, and apical akinesis. Coronary catheterization showed severe disease in LMCA, LAD, and RCA.

IMPACT/DISCUSSION: Influenza related myocarditis is due to diffuse inflammation of the myocardium leading to focal myocyte necrosis. Additionally, influenza can trigger myocardial infarction by inducing a hypercoagulable and inflammatory state. Both of these states lead to significant myocardial damage and high troponins leading to cardiomyopathy. While a high degree of suspicion for myocarditis needs to be kept in mind, differentiating between the two is difficult and often requires cardiac catheterization. Recent post-mortem studies have shown that myocarditis is common in fatal cases of influenza and often goes undiagnosed. Patient A was diagnosed with influenza associated myocarditis and was treated conservatively with full recovery. Patient B opted for PCI as opposed to CABG due to his age. He had a complicated hospital course but made a full recovery. This decision making was primarily guided by echocardiographic assessment for wall motion abnormalities in both patients.

CONCLUSION: The pulmonary manifestations in influenza are prominent and may mask cardiac involvement. These cases also highlight the need for guidelines to differentiate ischemic versus non-ischemic cardiomyopathy in the setting of influenza to guide appropriate management.

THE DISEASE YOU KEEP MEANING TO LOOK UP

Hannah Bernstein; Corey Costantino; Tameka Smith; Celeste Newby. Tulane University School of Medicine, New Orleans, LA. (Control ID #3184055)

LEARNING OBJECTIVE #1: Apply the H-score to estimate the probability of HLH

LEARNING OBJECTIVE #2: Review the current recommended treatment of EBV-associated HLH

CASE: A 28 year-old man presented with a four-day history of fever, headache, nausea, vomiting, diarrhea, and confusion. He immigrated from Honduras 6 years earlier and had no significant past medical history. He had a temperature of 103.2°F, pulse of 133 bpm, and BP of 126/60 mmHg. He was alert and oriented but had difficulty answering questions. Physical exam demonstrated hepatosplenomegaly. No nuchal rigidity was present. Lab work revealed platelet count $42 \times 10^9/L$, AST 260 U/L, ALT 139 U/L, triglycerides 991 mg/dL, CRP 196, LDH 2292 U/L, and lipase of 205 U/L. D dimer 6.8 ng/mL. Empiric treatment for sepsis from possible intra-abdominal infection was initiated. On hospital day one, the patient was found obtunded and required intubation. CT head and MRI brain were did not reveal any acute pathology. CSF had no pleocytosis; CSF bacterial cultures and viral PCR were negative. Lab work revealed worsening transaminase levels and pancytopenia. Further testing revealed a markedly elevated ferritin ($>26,000 \text{ ng/mL}$) and IL-2 (53,000 U/mL). Serum EBV DNA PCR titer was 95,500 cpy/mL. These lab studies and bone marrow biopsy results confirmed a suspected diagnosis of (HLH). Induction chemotherapy per HLH-2004 protocol was initiated. The patient responded to treatment with resolution of encephalopathy, normalization of lab values, and significant improvements of EBV viremia.

IMPACT/DISCUSSION: HLH is an aggressive and potentially life-threatening immune activation syndrome that is often associated with viral etiologies or malignancy in adult populations. EBV is the most commonly reported viral trigger, with mortality rates ranging 20 to 88% even with aggressive treatment. The diagnosis of HLH should be considered in adults presenting with multi-organ system failure, cytopenia, acute liver injury, and markedly elevated ferritin levels. The H-score, which includes points for fever, organomegaly, and lab abnormalities, is a risk-stratification tool that can estimate the probability of HLH, allowing for prompt initiation of treatment. The mainstay of HLH treatment is etoposide and dexamethasone, with cyclosporine and intrathecal methotrexate considered in patients with CNS involvement. In EBV-associated HLH the addition of rituximab is associated with lower EBV titers and ferritin level at 1 month. Treatment with anti-virals is also recommended in patients with active viremia, although supporting data is sparse. Hematopoietic stem cell transplantation is considered for patients who are refractory to initial therapy. The patient described herein had excellent initial recovery with cyclosporine induction, etoposide, rituximab, and a course of ganciclovir.

CONCLUSION: HLH is a potentially life-threatening condition that the internist needs to recognize early so appropriate treatment can be initiated. The H-score can be used to risk stratify patients.

THE EYES HAVE IT: RARE MANIFESTATIONS OF ADULT-ONSET IGA VASCULITIS

Briggs Hoyt²; Naomi Habib¹; Surabhi Uppal³; Ishani Shah³; Madeline Singer¹; Binh T. Duong⁴. ¹St Joseph's Hospital and Medical Center/Creighton University Medical School, Phoenix, AZ; ²Creighton University School of Medicine, Phoenix, AZ; ³St Joseph's Hospital and Medical center, Phoenix, AZ; ⁴St. Joseph Hospital and Medical Center, Phoenix, AZ. (Control ID #3176629)

LEARNING OBJECTIVE #1: Identify classic features of IgA Vasculitis in the setting of a complicated medical background.

LEARNING OBJECTIVE #2: Be able to associate rare manifestations of IgA vasculitis based on disease physiology.

CASE: A 49-year-old man presented with 1 week of chest pain, fever, and a rash. Extensive medical history included replaced congenital bicuspid aortic valve (on warfarin), stroke, pulmonary embolus, and chronic kidney disease.

Exam was significant for bilateral crackles and a hemorrhagic palpable purpuric rash on his legs. Labs showed platelets 105, subtherapeutic INR 1.7, and creatinine 5.46 (baseline 3.5), with urinalysis significant for microscopic hematuria and proteinuria, and mild pulmonary congestion on chest imaging. He underwent diuresis and hemodialysis for fluid overload due to acute renal failure. On day 4 of admission, he developed sudden left-sided vision loss and was diagnosed with anterior ischemic optic neuropathy (AION). Echocardiogram and MRI were negative for thrombi. On day 5, his rash was noted to extend to his abdomen and chest. Autoimmune and infectious workup was negative; dermatology suspected reactive vasculitis and recommended supportive care. On day 6, he began experiencing chest pain and went into cardiogenic shock and cardiac arrest. He progressed to multiorgan failure despite intensive therapy, and care was withdrawn. The day after death, skin biopsy with immunofluorescence revealed leukocytoclastic vasculitis and perivascular IgA granules, consistent with IgA vasculitis (IgAV).

IMPACT/DISCUSSION: IgAV is primarily a pediatric disease, with a much rarer in its incidence in adults (0.1-0.8 per 100,000), often associated with higher morbidity and mortality. The majority of symptoms are due to formation of IgA complex deposits within end-organs small vessels, with the resultant classic tetrad of palpable purpura, polyarthropathy, gastrointestinal (GI) manifestations and nephritic syndrome. Recognizing IgAV in adults without this classic presentation can be difficult. Our patient's confounding factors, including his previous thrombi and presumed uremic thrombocytopenia, made the diagnosis of IgAV more challenging. Further, in keeping with its effects on small vessels, IgA vasculitis can presents with mononeuropathies, such that monocular vision loss in the presence of a purpuric rash should prompt suspicion of vasculitis. AION is mainly associated with giant cell arteritis, but is a rare complication of other vasculitides as well, with only 2 other IgAV-associated cases described previously. Diagnosis is made on the basis of histopathology. No randomized-controlled trials exist to guide therapy; however experts recommend pulse-dose steroids for rapidly-progressive renal failure.

CONCLUSION: IgA Vasculitis should be considered when palpable purpura, athralgia, and GI/renal symptoms present concurrently, even in an adult. The sentinel event for a vasculitis can theoretically occur anywhere that vascular occlusion would present acutely.

THE FORGOTTEN PRE-CANCEROUS ITCH: VULVAR LICHEN SCLEROSIS

Mariella Ntamatungiro. Weill Cornell Medical College-New York Presbyterian Medical Center, New York, NY. (Control ID #3186124)

LEARNING OBJECTIVE #1: Review vulvar lichen sclerosis as a differential for recurrent vulvar itching.

LEARNING OBJECTIVE #2: Recognize vulvar lichen sclerosis as a high risk precursor lesion for vulvar squamous cell carcinoma.

CASE: 41 yo monogamous woman with 2 children presented with recurrent vaginal itching over a period of 4 months. The itching occurred intermittently and unpredictably without discharge, dysuria, bleeding, or dyspareunia. Notably she denied new partners, douching, tight clothing, or change in hygiene products. She reported regular menstrual cycles and had her last child 3 years ago. She has had 4 clinic visits over this time frame. She has tested negative for bacterial vaginosis, candidiasis, trichomoniasis, gonorrhea-chlamydia, HIV, syphilis, and urinary tract infections. Pap with HPV testing was normal. Empiric treatment for candidiasis and bacterial vaginosis with fluconazole and metronidazole did not resolve her itching. On external pelvic exam, pertinent positives included erythema and skin hypo-pigmentation of the labia

minora with patchy scaly skin. There was an absence of vulvar discharge or tenderness. Speculum exam was unremarkable with a benign cervix and absence of tenderness with bimanual exam. She localized her itching to the hypo-pigmented area on exam. Repeat infectious testing returned negative. Patient was referred to gynecology and dermatology with subsequent pathology confirming lichen sclerosis. She was treated with topical clobetasol ointment.

IMPACT/DISCUSSION: Lichen sclerosis is a rare autoimmune vulvar dermatological pathology that often presents with vulvar pruritus in 90% of cases. Vulvar pruritus often is severe enough to induce significant scratching resulting in skin scarring, dyspareunia, apareunia, and burning in some women. It causes vulvar skin changes such as hypo-pigmentation, skin thinning and scarring. Vulvar lichen sclerosis prevalence is unknown however it commonly occurs between the ages of 40 to 60. Under diagnosis is common and are due to many reasons. First, the condition is rare and practitioners often focus on more prevalent vulvar pruritic conditions such as bacterial vaginosis, vulvovaginal candidiasis, and trichomonas especially in sexually active and pre-menopausal women. Second, the vulvar pruritus episodes can be transient in many women leading to inconsistent or delayed treatment with topical corticosteroids. However, recognition matters given 5% of vulvar lichen sclerosis cases progress to squamous cell carcinoma. Long term therapy with topical corticosteroids does reduce risk of primary vulvar cancer in recent literature. However, only 1 in 4 women with lichen sclerosis are consistently prescribed maintenance therapy. Primary care doctors should refer to vulvar specialists for close monitoring for progression to malignancy and for consistent treatment.

CONCLUSION: Vulvar lichen sclerosis is an under diagnosed and treatable cause of vulvar itching. Vulvar lichen sclerosis progresses to squamous cell carcinoma in 5% of cases.

THE HAART OF THE MATTER: LIFE THREATENING MEDICATION INTERACTIONS IN HIV PATIENTS

Phillip S. Hamilton, UPMC, Pittsburgh, PA. (Control ID #3176929)

LEARNING OBJECTIVE #1: Recognize potential for drug-drug interactions when a medication is discontinued

LEARNING OBJECTIVE #2: Manage inhaled corticosteroids in patients with HIV on Highly Active Antiretroviral Therapy (HAART)

CASE: A 55-year-old man with a history of HIV, hypertension, and COPD presented with acute onset of hypotension. He had been on the combination antiretroviral Elvitegravir-cobicistat-emtricitabine-tenofovir alafenamide (Genvoya®) for approximately one year but had discontinued it ten days prior to presentation. His last known CD4 count was 273 c/uL one month prior. He was compliant with his other medications including HCTZ/lisinopril, inhaled tiotropium and inhaled fluticasone/vilanterol. He presented with a blood pressure of 60/40 mmHg, a pulse of 130 bpm, lactate of 3.7 mmol/L and WBC of 9.8 K/cmm. Due to concern for sepsis he was given IV antibiotics, IV fluids, and IV methylprednisolone and transferred to a higher level of care. On arrival, he had only mild symptoms to report and his blood pressure was 139/87 mmHg. A basic infectious evaluation was unremarkable. Reviewing his medications, it was noted that the cobicistat contained in the Genvoya he had discontinued ten days prior inhibits the metabolism of fluticasone. For several months the patient had noted worsening central obesity and increased prominence of the dorsocervical fat pad consistent with a cushingoid appearance. The sudden removal of the cobicistat resulted in a drop in serum steroid levels in a patient with a suppressed adrenal axis. An ACTH stimulation test was obtained, 0800 cortisol was 1.5 ug/ dL which increased to 16 ug/dL. Endocrine consultants agreed that the transient

hypotension was likely related to adrenal suppression from the cobicistat/fluticasone combination. He was started on hydrocortisone and inhaler changes were made.

IMPACT/DISCUSSION: This is a unique case of a drug-drug interaction leading to a presentation of adrenal insufficiency. The combination of the cobicistat and inhaled fluticasone led to corticosteroid excess and adrenal suppression. The removal of the HAART effectively decreased the level of circulating corticosteroid which resulted in hypotension that improved with steroid administration. The cobicistat in the combination HAART drug is a potent CYP3A inhibitor, whose purpose is to increase or "boost" the levels of elvitegravir via CYP inhibition. In this case the drug-drug interaction became clinically evident with the removal of the HAART. The culprit interacting drug was an inhaler, which can be overlooked as a potential interacting medication.

CONCLUSION: Internists must have a heightened suspicion for drug-drug interactions with HIV medications, including inhaled medications which are often overlooked. Among the inhaled corticosteroids, fluticasone has a high likelihood of interaction and should be avoided in patients on a boosted HAART regimen such as Genvoya.

THE HEADACHE WITH A WORLD OF POSSIBILITIES

Roberto Herrera; Michael P. Smith. University of Nebraska Medical Center, Omaha, NE. (Control ID #3186091)

LEARNING OBJECTIVE #1: Identify the differential diagnosis of meningitis to include geographic risk factors.

LEARNING OBJECTIVE #2: Understand common incidental findings in immigrant populations can mask typical disease presentations.

CASE: A 27 year-old woman presented with one day history of worsening neck pain, stiffness, and headache. She also reported photosensitivity and vomiting. She denied ever being vaccinated for meningitis and immigrated to the United States from Guatemala 3 years ago. She appeared uncomfortable but was afebrile and oriented to person, place, and time. No focal neurologic deficits were observed. She did not have any evidence of rash or petechiae. The neck was stiff and flexion produced pain. A lumbar puncture revealed a CSF glucose of 32 mg/dL and a CSF protein of 91 mg/dL. CSF cell count with differential revealed 400/cm WBC and 16% neutrophils. Gram stain of the CSF was negative. A meningitis panel of CSF was negative as well as a West Nile virus IgG and IgM. A head CT showed multiple cysts with nodular mural irregularity and punctate calcifications in and along both cerebral hemispheres consistent with Neurocysticercosis. A Strongyloides antibody IgG was also positive.

IMPACT/DISCUSSION: Headache and neck stiffness are commonly encountered by the internist. As the immigrant population continues to grow in the United States, it is important to identify incidental findings that may mask a typical presentation. It is estimated that 50 million people worldwide have a cysticercosis infection. Cysticercosis is endemic in Central and South America. It is also endemic in India, Asia, and sub-Saharan Africa. Most cases of Neurocysticercosis are found incidentally via radiographic imaging in asymptomatic patients. The most common presentation of symptomatic neurocysticercosis is seizure. Another common presentation is with symptoms of elevated intracranial pressure associated with parenchymal disease. This has an important treatment consideration as any antiparasitic therapy should be held if there is untreated hydrocephalus, high cyst burden, or presence of calcified lesions only. Antiparasitic therapy carries the risk of worsening neurologic symptoms due inflammation around the degenerating cysts. Strongyloides is also endemic in tropical and subtropical regions. It is estimated that the prevalence in subtropical regions may be as high as 25 percent. Typical manifestations of the disease include gastrointestinal symptoms that

tend to wax and wane. Strongyloidiasis is also associated with cutaneous and pulmonary symptoms that are present chronically.

CONCLUSION: It is important for the general internist to identify common presentations amongst previously uncommon imaging and laboratory findings.

THE HEART OF THE MATTER: A CASE OF CARDIAC AMYLOIDOSIS PRESENTING AS SYNCOPE

Curtis Kovaleski¹; Ami DeWaters². ¹Hershey Medical Center, Hummelstown, PA; ²Penn State Hershey Medical Center, Hershey, PA. (Control ID #3186420)

LEARNING OBJECTIVE #1: Describe the clinical presentation of syncope due to cardiac structural disease.

CASE: A 73-year old woman presented for syncope without palpitations, prodrome or chest pain. On presentation, pulse was 48, blood pressure 108/66, and oxygen saturation 94%. On exam, she was fatigued with no distress, bradycardic with no murmurs, and had one-plus pitting edema. She had an elevated creatinine of three and a brain natriuretic peptide of 257. An electrocardiogram showed a junctional rhythm, low voltage, and bradycardia. A transthoracic echocardiogramE was obtained and showed an ejection fraction of 50-55% and a speckled appearance in the hypertrophied left ventricular wall. With suspicion for infiltrative cardiomyopathy, serum protein electrophoresis was sent and returned positive for monoclonal immunoglobulin. Too unstable for cardiac MRI, she underwent a bone marrow biopsy which showed plasma cell myeloma along with a positive congo red stain and she was diagnosed with cardiac amyloidosis associated with plasma cell myeloma. Chemotherapy was started, however after her first dose; she proceeded into anuric renal failure. After discussion with the patient and family, dialysis was discontinued and she proceeded with hospice care.

IMPACT/DISCUSSION: Syncope has multiple different etiologies, including cardiac arrhythmias, cardiac structural disease, reflex syncope, and neurologic causes. One way to distinguish cardiac etiologies from other etiologies of syncope is the lack of prodrome. In this case, the patient had no warning signs prior to syncope, which was indicative of a cardiac etiology and initiated a cardiac evaluation that revealed cardiac amyloidosis. In cardiac amyloidosis, extracellular abnormal protein deposits in cardiac tissue leading to diastolic and systolic dysfunction and congestive heart failure. Recognizing the symptoms of diastolic heart failure like syncope is key in early diagnosis which is instrumental in a patient's course. Prognosis is dependent on the number and severity of organs involved, with cardiac involvement carrying the worst prognosis. There is a median survival of six months in untreated patients from onset of congestive heart failure. Therefore, prompt evaluation for amyloidosis is necessary. Initial cardiac work up often includes electrocardiogram and echocardiogram. Cardiac MRI can be very helpful to see diffuse sub-endocardial myocardial enhancement, but definitive diagnosis is best done by cardiac biopsy showing amyloid. However as in the case above, a less invasive bone biopsy with amyloid staining can be done to identify cardiac AL amyloidosis. From staining, accurate typing of amyloid is possible, allowing tailored treatments necessary for targeting the underlying plasma cell disorder.

CONCLUSION: Syncope without a prodrome is indicative of a cardiac etiology. Cardiac amyloidosis can present with syncope, and prompt evaluation for cardiac amyloidosis is necessary to avoid poor outcomes.

THE HUNT THAT TAKES YOUR BREATH AWAY

syed mohsin saghir¹; SYED R. SHAH²; Arhamma A. Malik⁴; SOBIA SYED³. ¹unlv school of medicine, Las Vegas, NV; ²UNIVERSITY OF NEVADA LAS VEGAS, Las Vegas, NV; ³Ayub Medical College, Las Vegas, NV; ⁴UNLV, Las Vegas, NV. (Control ID #3186141)

LEARNING OBJECTIVE #1: Recognize clinical features of Hantavirus pulmonary syndrome (HPS)

LEARNING OBJECTIVE #2: Manage HPS

CASE: 64 yr old male with no significant PMH was admitted with C/C of high grade fever, myalgias, vomiting and diarrhea. Patient reported a recent history of travel to Cambodia where he worked in areas of rodent exposure and experienced mosquito bites. On presentation he was hemodynamically stable and had a benign physical exam. Pertinent lab findings included a plt count of 48k, Cr 1.3 and PBS showed 1% parasitemia due to P. vivax. He was started on antimalarials and was admitted for further management. Extensive work up was done to exclude infectious and arthropod borne illnesses. Respiratory biofire, HIV, hepatitis panel and pan cultures were negative. Serology for chikungunya, dengue fever, leptospirosis, RMSF, West Nile and Zika virus was negative. Fungal etiologies were excluded. Patient during hospital course developed respiratory distress with tachypnea, hypoxia and became hypotensive. X-ray chest showed dense bilateral infiltrates. Patient was upgraded to ICU for management of pulmonary edema and was intubated for ventilator support. Echo showed normal left ventricular function. Despite adequate supportive measures patient continued to deteriorate and developed AKI requiring hemodialysis. Repeat PBS showed no organisms. Detection of Hantavirus specific IgM lead to the final diagnosis of HPS. Patient eventually had a tracheostomy and PEG done due to difficulty in weaning off the ventilator and was discharged to an LTAC.

IMPACT/DISCUSSION: The diagnosis of HPS was pursued as patient continued to deteriorate despite getting adequate antimalarial treatment concluding that the malaria was probably a red herring in a traveler returning from an endemic area. HPS is a life threatening rodent borne RNA viral infection. Hantaviruses are divided into New and Old World viruses. New World viruses cause HPS mostly in America. Old World viruses cause hemorrhagic fever with renal syndrome (HFRS) localized to Asia and Europe. Our patient met the clinical picture of HPS although being from Asia where HFRS is more common. Presenting features include fever, myalgias, vomiting, diarrhea and abdominal pain with rapid transition to non-cardiogenic pulmonary edema and shock followed by resolution of respiratory and hemodynamic abnormalities in the next few days. Recovery is associated with prolonged weakness. Lab findings include thrombocytopenia, leukocytosis and an atypical lymphocytosis. Diagnosis is dependent upon detection of Hantavirus IgM and IgGs and PCR on blood or detection of Hantavirus Ag on tissue. No specific treatment is available. Supportive care including mechanical ventilation, vasopressors, inotropes and cautious IV fluids are needed in ICU setting.

CONCLUSION: Renal involvement in HPS is usually mild, but cases have been reported showing severe disease. This case proves that HPS with severe renal failure may not be as uncommon as once thought.

THE IDENTITY OF THE MYSTERY ANASARCA: THE DECREASE OF PLATELET COUNTS MAY TELL YOU THE CLUE FOR DIFFERENTIAL DIAGNOSIS.

Ryutaro Nagaya¹; Mutsumi Murayama²; takehiko takeda¹; Hidekazu Takahashi²; tomokatsu kato¹; Takamasa Tanaka¹; Mitsunori Iwase¹. ¹Toyota memorial hospital, Toyota-city, Japan; ²Toyota memorial hospital, Toyita-city, Japan. (Control ID #3183744)

LEARNING OBJECTIVE #1: Identify thrombocytopenia, anasarca, and fever as the triad symptoms in TAFRO syndrome.

LEARNING OBJECTIVE #2: Understand the importance of prompt diagnosis and early interventions of TAFRO syndrome.

CASE: The patient was a 58-year-old Japanese female without a past medical history. She presented to our emergency department with a chief complaint of

abdominal pain lasting for 1 week. Her vital signs were within normal range. She had mild diffuse abdominal tenderness without rebound tenderness. Laboratory tests revealed elevation of WBC($9.7 \times 10^3/\mu\text{L}$), CRP(20mg/dL) and ALP(575 U/L). Levels of platelet count(13.9 g/dL) and LDH(231 U/L) were normal. CT showed moderate ascites without morbid lymphadenopathy or hepatosplenomegaly. She was admitted for presumed peritonitis and started on cefmetazole. On the 3rd day, she had a fever of 39 degrees. Blood and ascitic fluid culture remained negative. Additional laboratory tests for HIV, CMV, hepatitis B and C virus, EBV, and tuberculosis were unremarkable. Tumor markers and anti-nuclear antibody were also negative. Upper and lower endoscopies revealed no abnormal pathology. CT showed pleural effusion additionally. On the 9th day, platelet count dropped to $9.2 \times 10^3/\mu\text{L}$. We added methylprednisolone and performed a bone marrow biopsy for suspected TAFRO syndrome. we also started anti-DIC therapy. On the 12th day, hemodialfiltration were started but shock vital and decreasing of platelet count sustained. On the 14th day, the results of bone marrow biopsy showed reticulin myelofibrosis, leading to our diagnosis of steroid-refractory TAFRO syndrome. We started tocilizumab as well as ciclosporin. She responded well and recovered, and was eventually discharged in good condition.

IMPACT/DISCUSSION: Impact We should suspect TAFRO syndrome in patients with thrombocytopenia, anasarca, and fever. Discussion TAFRO syndrome was first identified in 2010. Although most cases are reported from Japan, The number of Caucasian patients cases is increasing. It involves a constellation of syndromes:Thrombocytopenia(T), Anasarca(A), Fever(F), Reticulin fibrosis(R), and Organomegaly(O). The first three criteria must be present for the diagnose of this syndrome. Our patient had a normal platelet count at initial presentation, which was atypical. We eventually diagnosed as TAFRO syndrome when a low platelet count became evident. However abdominal pain and elevated ALP levels with normal LDH levels may be also helpful to rule in this syndrome earlier. Most patients are initially treated with corticosteroid, but only 52% of the patients respond well to it. Some refractory cases require more aggressive therapy such as tocilizumab and ciclosporin. TAFRO syndrome often progresses rapidly but is curable as with our case. Prompt diagnosis and interventions are crucial to improve the outcome of this syndrome.

CONCLUSION: TAFRO syndrome was first reported in Japan and not well known in the US. However we should consider this syndrome as a differential diagnosis in patients with more than 1 criteria of the triad.

THE IMPORTANCE OF FILLING UP THE TANK

Thomas Rusher; Deepa Bhatnagar. Tulane University School of Medicine, New Orleans, LA. (Control ID #3185294)

LEARNING OBJECTIVE #1: Demonstrate the cardiac manifestations of hypophosphatemia.

CASE: A 46 year old woman presented with nausea, vomiting and epigastric pain for 1 day with associated poor oral intake. She had a history of peptic ulcer disease and alcohol abuse. She denied any chest pain, shortness of breath, or palpitations. Exam was significant for epigastric tenderness. Electrocardiogram showed bradycardic sinus rhythm with prolonged QTc to 537 ms as well as biphasic t-waves. Labwork was significant for severe hypophosphatemia of 0.9 mg/dL. Her potassium was 3.5 mmol/L, and magnesium of 1.8 mg/dL. Her anion gap was calculated to be 18 with positive ketones on urinalysis. The patient received IV ondansetron and promethazine in the emergency department with improvement in her nausea symptoms. Upon transfer to the observation unit, she suddenly became apneic and pulseless. Cardiac monitoring revealed ventricular tachycardia, and later, ventricular fibrillation. The patient was resuscitated with chest compressions and 2 defibrillator shocks.

Emergent coronary angiogram showed no significant coronary disease. Follow-up transthoracic echocardiogram revealed decreased left ventricular function with ejection fraction of 20-25%. The patient recovered in the hospital with repletion of her phosphorous. Repeat echocardiogram 1 month after discharge showed return of normal left ventricular systolic function.

IMPACT/DISCUSSION: Phosphate plays an important role in cardiac function due to the formation of adenosine triphosphate (ATP) and red cell 2,3 diphosphoglycerate, which augments the hemoglobin-oxygen dissociation curve. Depletion of ATP can lead to dysfunction in myocardial contractility as well as decreased oxygen delivery to cardiac tissue. The importance of phosphorous to cardiac function is highlighted in studies which have shown an improvement in left ventricular function with correction of severe hypophosphatemia. Hypophosphatemia has also been linked with significant ventricular ectopic activity. Studies have shown low phosphorous is associated with a higher incidence of ventricular arrhythmias in the setting of acute myocardial infarction as well as in sepsis. Hypophosphatemia is caused by a number of mechanisms including decreased dietary intake, intracellular shift, impaired absorption, and increased renal phosphate excretion. In our case, we suspect the patient's low phosphorous was secondary to decreased PO intake. Her initial metabolic derangements were attributed to starvation ketosis and an over the counter diuretic the patient was taking. Additionally, the patient's EKG showed a prolonged QT interval, likely exacerbated by the IV antiemetics she received, ultimately leading to her ventricular tachycardia.

CONCLUSION: Electrolyte repletion and monitoring of QT intervals are common practices in the hospital setting. This case demonstrates the dangers associated with grossly abnormal electrolyte balance as well as the need to monitor therapies to avoid possibly fatal arrhythmias.

THE KEY IS IN THE HISTO-RY: A CASE OF FEVER IN A TRANSPLANT PATIENT

Eduardo Mulanovich¹; Surya Bhatt². ¹University of Alabama - Birmingham, Birmingham, AL; ²University of Alabama at Birmingham, Birmingham, AL. (Control ID #3184506)

LEARNING OBJECTIVE #1: Describe disseminated histoplasmosis as a cause of sepsis in the immunocompromised host

LEARNING OBJECTIVE #2: Detail the sensitivity of diagnostic tests for histoplasmosis as well as the importance of histological evaluation

CASE: A 55-year-old man from east Texas with a kidney-pancreas transplant 14 years prior on immunosuppression was transferred for 10 days of fever, abdominal pain, and dyspnea. Physical exam was pertinent for fever, tachycardia, tachypnea, hypoxemia, and bilateral diffuse crackles. CT-chest showed diffuse ground glass opacities. He quickly developed worsening dyspnea, altered mentation, and shock requiring intubation and initiation of CRRT and vasopressors. He was started on broad spectrum antibiotic coverage for hospital acquired pneumonia and PJP. Labs showed creatinine 3.2 mg/dL, lactic acid 0.8 mMol/L, WBC 22,000/cmm (96% neutrophils), ALT 146 U/L, Alk Phos 785 U/L, ferritin >30,000 ng/mL, and LDH 1,961 U/L. CT-abdomen and CT-head were unremarkable. Cryptococcal and urine legionella antigens (Ag), T2 candida, and blood and urine cultures were negative. BAL aspergillus Ag, legionella Ag, HSV, CMV, aerobic and anaerobic cultures, and AFB were negative. On hospital day 4, peripheral blood smear revealed intracellular yeast and liposomal amphotericin B was started. Urine Histoplasma Ag was positive on day 9. Cultures from BAL and fungal isolator blood were positive for Histoplasma on day 10 and 22 respectively. He deteriorated and died on day 30.

IMPACT/DISCUSSION: Histoplasmosis is an endemic mycosis of the Ohio and Mississippi river valleys that may present as an opportunistic

infection. Disseminated histoplasmosis occurs mostly in immunocompromised patients. Fever, weight loss, hepatosplenomegaly, lymphadenopathy, and mucocutaneous lesions are common presenting findings. Common labs include pancytopenia, transaminitis, and elevated ferritin and LDH. Chest X-rays can have a miliary pattern. Diagnosis is made by blood or tissue cultures in 65% of cases, but this may take 2-8 weeks. Histoplasma urine and serum Ag combined have 95% sensitivity. Rapid diagnosis may be made from buffy coat or peripheral smear of blood in up to 50% of cases, as in our case. Histologically, Histoplasma capsulatum appear as intracellular round yeast in leukocytes and are associated with disseminated disease and worse prognosis. Standard treatment is liposomal amphotericin B and should be started immediately as the disease is usually fatal within 2-12 weeks.

CONCLUSION: Suspect disseminated histoplasmosis in immunocompromised patients from endemic areas with sepsis, bilateral pulmonary infiltrates, pancytopenia, and elevated LDH and ferritin. Direct examination of blood through smear or buffy coat is a specific test that can provide a rapid diagnosis when positive since Histoplasma Ag, cultures, or tissue biopsy have a long turnaround time. Empiric therapy should be considered in immunocompromised patients with a clinical picture consistent with disseminated Histoplasmosis before laboratory confirmation.

THE LIMITS OF RELIGIOUS AND MEDICAL BELIEF: AN ETHICAL LESSON

Kevin Liu, Beth Israel Mount sinai, New York, NY. (Control ID #3186411)

LEARNING OBJECTIVE #1: In the chronic setting, severely anemic levels can be tolerated as long as no signs of organ failure or hemodynamic instability are present.

LEARNING OBJECTIVE #2: In the chronic setting, severely anemic levels can be tolerated as long as no signs of organ failure or hemodynamic instability are present.

CASE: A 35 year old female with past medical history of CKD stage 5, and intellectual disability presented to the hospital with menorrhagia and severe anemia of a hemoglobin of 2.6 g/dL and undetectable reticulocyte count. Patient vital signs did not show signs of hemodynamic instability. On physical exam patient was not showing signs of distress, pale, but otherwise unremarkable exam. The parents had legal guardianship papers, which stated that they were Jehovah's Witnesses and refused blood products for their child. The intensive care unit was consulted, and brought the patient into the critical care unit for further observation of decompensation. The parents provided paperwork stating they could withdraw life-sustaining measures: Because their request to withhold blood was on a religious basis, and the patient had an intellectual disability that prevented her from expressing religious belief, the particular life-saving measure of blood transfusion was religious rather than out of futility, blood could not be held from the patient in life-saving circumstances. The patient began showing signs of liver damage through rising liver enzymes, and troponin rose from 0.139 to 0.200, showing signs of possible organ damage secondary to severe anemia. Given continued hemodynamic stability and no overt signs of organ failure, no transfusion was given at this time. The patient's labs eventually trending towards recovery, and the patient was eventually able to be discharged with gynecology follow-up for the initiation of a contraceptive.

IMPACT/DISCUSSION: Cognitive function tends to decline at around hemoglobin of 5 g/dL in the acute setting, in chronic states allowing time for compensation, lower hemoglobin levels can be achieved. The resilience of the human body in these extreme circumstances has been seen in other case reports, mainly of Jehovah's Witnesses. Adults with decision-making capacity have the right to refuse life-saving therapy. In this case, the patient is a

protected population due to intellectual disability. In the case of HCA Inc v Miller, where life-sustaining treatment was provided for a child despite parents wishes, and ultimately the court ruled in favor of the physicians who helped the child. This case demonstrates that in a population that cannot speak for itself, if there is a life-saving treatment without demonstrated futility, it should be provided.

CONCLUSION: The practice of medicine should blend science and humanity together in order to make the best possible outcome. But, the most important thing is the patient's life and wishes, and if he/she cannot speak for themselves, we must take it upon ourselves as physicians to protect them.

THE MYSTERY COUGH: UNCOMMON CAUSES OF CHRONIC COUGH

Hassan A. Raza; Adam Hines; Arineh Melkonian; Cindy Sadikot. New York Presbyterian Queens, Dix Hills, NY. (Control ID #3175692)

LEARNING OBJECTIVE #1: Recognize the differential diagnosis of a chronic cough, including its uncommon causes

LEARNING OBJECTIVE #2: Recognize anchoring and availability biases as significant causes of delays in diagnosis

CASE: A 53-year-old man with no smoking history presented to the primary care clinic with persistent productive cough with white sputum and wheezing of 3 months duration. He initially presented to an urgent care center and our ED, was diagnosed with sinusitis and treated with steroids and antibiotics without relief. He had been using an albuterol inhaler with some relief of symptoms. He was suspected to have some form of reactive airway disease, exacerbated by his exposure to dust particles during his work as a mechanic. He was recommended to wear a mask at work, continue albuterol as needed, and to obtain pulmonary function testing when his symptoms resolve. One week later, his symptoms progressed with worsened wheezing and scant hemoptysis. As he had a history of latent tuberculosis (TB) and unresolved symptoms, a computed tomography scan of the lung without contrast was pursued. It showed a linear radiopaque density identified within the bronchus intermedius, extending into the right lower lobe bronchus, consistent with a radiopaque foreign body. He subsequently underwent flexible bronchoscopy and had the foreign body removed. On pathology, it was noted to be consistent with a fishbone. After the procedure, his symptoms completely resolved.

IMPACT/DISCUSSION: Chronic cough affects roughly 12% of the general population on a daily or weekly basis,¹ significantly decreasing a patient's quality of life.² Respiratory diseases, including chronic cough, is the most common reason for an adult to visit their primary care physician.³ The 3 most common causes of chronic cough include: post-nasal drip syndrome, asthma, and gastroesophageal reflux disease.⁴ Less common causes include: bronchiectasis, lung cancer, and aspiration (food in adults, foreign bodies in children).⁵ Our patient did not recall coughing or choking during any of his meals prior to onset of symptoms. This missing piece of information made this diagnosis more of a challenge. In one study, the most common symptoms of foreign body aspiration were chronic cough, hemoptysis, fever, and dyspnea, and only 7% of patients presented with choking.⁶ This case also demonstrates anchoring and availability bias, problems of which are common in the primary care setting.^{7,8} His partial response to bronchodilators, and the high prevalence of TB in our community delayed his diagnosis, leading to significant morbidity. We feel this case adds to the medical literature by emphasizing the less common causes of chronic cough.

CONCLUSION: Chronic cough is associated with significant morbidity and decline in quality of life for patients, in which it is imperative for a general internist to maintain broad differential diagnoses. An absence of a history of choking during meal ingestion does not effectively rule out a foreign body aspiration as the etiology for chronic cough.

THE PERFECT STORM: DISSEMINATED HODGKIN LYMPHOMA PRESENTING WITH CHOLESTATIC LIVER INJURY AND HEMOPHAGOCYTIC LYMPHOHISTIOCYTOSIS

Neethu E. Abraham; Nathanael Bailey; Bryan Rea; Kristen M. Livesey. University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #3179470)

LEARNING OBJECTIVE #1: Recognize hemophagocytic lymphohistiocytosis as a cause of acute cholestatic liver injury

LEARNING OBJECTIVE #2: Distinguish causes of hemophagocytic lymphohistiocytosis and the impact on management

CASE: A 49-year-old women with irritable bowel syndrome presented with 2 weeks of lethargy, confusion and 3 days of jaundice, abdominal distension and lower extremity edema. Family reported a 40lb weight loss, intermittent fevers and night sweats. Examination was notable for confusion with jaundice, tender hepatosplenomegaly, left axillary lymphadenopathy and anasarca. Labwork was notable for pancytopenia, normal AST/ALT and elevated total bilirubin (17.7 mg/dL), direct bilirubin (13.2 mg/dL), alkaline phosphatase (309 IU/L), ferritin (>1500 ng/mL), triglycerides and LDH. CT of the chest, abdomen and pelvis with contrast was notable for left axillary, right paratracheal and retroperitoneal lymphadenopathy and hepatosplenomegaly with hypodense lesions throughout the liver and spleen. Workup for liver failure included negative hepatitis A, B and C, CMV, HSV and HIV serologies. EBV PCR was 41,000 copies. Left axillary lymph node biopsy revealed Reed-Sternberg cells and EBV positive cells consistent with classic Hodgkin lymphoma (HL). Bone marrow biopsy showed evidence of hemophagocytosis and extensive marrow involvement by HL. Diagnosis of HLH due to classic HL was made and she was treated with etoposide and dexamethasone. She subsequently received Cytoxan, Rituxan and dose-reduced Gemcitabine with resolution of her cholestasis.

IMPACT/DISCUSSION: HLH is a rare but fatal disease. This case offers an opportunity to highlight the high degree of suspicion required for diagnosis. Early diagnosis can alter the course and prognosis of the disease if the secondary cause is appropriately addressed. HLH is characterized by excessive inflammation due to a hyper-stimulated but dysregulated immune system. Initial signs and symptoms can mimic common infections, hepatitis or encephalitis, making prompt recognition challenging. In our patient, the cholestatic liver injury made clinical recognition of HLH challenging. While LFT abnormalities are common in cases of HLH, it is a rare cause of cholestasis. The cholestatic injury is due to portal and biliary infiltration by lymphocytes and histiocytes. HLH can occur as a familial or acquired disease; the latter thought to be triggered by infection, malignancy or connective tissue disorder. Development of HLH is rarely associated with HL and interestingly EBV is more prevalent in these cases. Moreover, HLH extension to the liver by HL is typically seen in advanced disease.

CONCLUSION: This case demonstrates the need for a high degree of clinical suspicion for the diagnosis of HLH in a patient presenting with fever, cytopenia and cholestasis with an extensive unremarkable infectious work up. The prompt initiation of treatment alters the disease course given the high associated mortality with unrecognized disease.

THE PERICARDIAL EFFUSION WITH A WORLD OF POSSIBILITIES

Kaiwen Sun; Michael P. Smith. University of Nebraska Medical Center, Omaha, NE. (Control ID #3185962)

LEARNING OBJECTIVE #1: Develop an approach to a patient with a pericardial effusion

LEARNING OBJECTIVE #2: Recognize indications for aggressive treatment of a pericardial effusion

CASE: A 35 year-old man presented for generalized weakness and shortness of breath for two days. The shortness of breath was worse with exertion. He denied chest pain, cough, syncope or edema. He had a history of hypothyroidism, heart failure with preserved ejection fraction, HTN and ESRD. His vitals were unremarkable. He had jugular venous distention 6cm above the suprasternal notch, muffled heart sounds, abdominal distention, mild pedal edema, and clear lung fields. He had a CHF peptide of 229, BUN of 90, anion gap of 23, unremarkable troponins and TSH. Chest x-ray remonstrated marked interval increase in cardiac silhouette size compared to a study 2 weeks ago, and TTE was significant for a large circumferential pericardial effusion with tamponade physiology and concentric LVH with ejection fraction of 35–40%. With a tentative diagnosis of uremic pericardial effusion, 1150ml of serosanguinous fluid was removed via urgent pericardiocentesis with drain placement. The drain contained 35ml of fluid and there was resolution of dyspnea and JVD. He received intensified PD with BUN improving to 72 upon discharge. Pericardial fluid demonstrated increased RBC and WBC (91% PMNs), with negative gram and AFB stains, culture, and cytology. Blood cultures were negative.

IMPACT/DISCUSSION: Confirming the presence of a pericardial effusion requires an echocardiogram, although items from the history and physical, EKG, and chest x-ray can all be suggestive. The general internist, using point of care ultrasound can most often observe a significant pericardial effusion. A formal transthoracic echo can be done to quantify the size of the effusion and to assess for cardiac tamponade. The factors that affect the impact of a pericardial effusion include rate of accumulation, size of effusion, and presence of pericardial scarring or adhesions. Establishing a cause of the effusion is often difficult and is based mostly on additional findings to guide additional evaluation. The course of most effusions tend to be benign but basic laboratory evaluation including a CBC, CMP, and thyroid studies. ANA and autoimmune evaluation should be undertaken if there are appropriate corresponding clinical factors. Pericardial fluid analysis should be performed in all cases of tamponade physiology, if an infectious or malignant cause is suspected, or if it is a large pericardial effusion. If there is no tamponade, treatment is aimed at treating the underlying cause. Asymptomatic patients with large effusion do not need immediate therapeutic drainage but it should be considered for diagnostic purposes

CONCLUSION: It is essential for the general internist to recognize and appropriately treat pericardial effusions. The approach involves establishing the presence of an effusion, assessing the hemodynamic impact, establishing the cause of the effusion, and then initiating the appropriate treatment.

THE POSITIVE SIDE OF A NEGATIVE

kohei oguni¹; Sandra Y. Moody²; Makito Yaegashi¹. ¹Kameda Medical Center, Kamogawa, Japan; ²Kameda Medica Center & UCSF/SFVAMC, Kamogawa City, Japan. (Control ID #3163932)

LEARNING OBJECTIVE #1: Recognize that a negative inflammatory marker can be a diagnostic clue in a patient with fever.

CASE: A 72-year-old woman with a fever for 10 days was evaluated in the outpatient clinic of our hospital. She had a mild headache, but no other associated symptoms. On examination, she was alert and oriented. Her temperature was 39.5°C, blood pressure 135/75mmHg, heart rate 93 beats per minute, respiratory rate 20 breaths per minute, and oxygen saturation 95% while breathing ambient air. Her neck was supple, with a normal range of motion. Laboratory testing revealed a white blood cell count of 6300/mm³ (73% neutrophils, 21% lymphocytes, 6% monocytes, 0% eosinophil), serum

sodium of 131 mEq/L, erythrocyte sedimentation rate of 15 mm/h, and C-reactive protein (CRP) level of 0.05 mg/dL. Blood cultures were negative, and ACTH stimulation test was normal. CT with contrast of the chest, abdomen, and pelvis did not reveal parenchymal abnormality, lymphadenopathy, or abscess. Given her fever and mild headache with negative CRP, we performed a lumbar puncture to rule out meningoencephalitis. Opening pressure was 14 cm of water. CSF analysis revealed 55 nucleated-cells per cubic millimeter (100% lymphocytes) and normal protein and glucose levels. The herpes simplex virus (HSV)-PCR was positive. MRI of the brain revealed hyperintensity in the left medial temporal lobe on both T2-weighted sequence and FLAIR sequence. HSV encephalitis was diagnosed. After initiation of a three-week course of acyclovir, her fever resolved.

IMPACT/DISCUSSION: There are fewer differential diagnoses to consider in patients with fever and negative inflammatory markers than in patients with positive inflammatory markers. Differential diagnosis in such patients includes early phase of a febrile illness, viral infection, drug fever, systemic lupus erythematosus, hyperthyroidism, thromboses, adrenal insufficiency, meningoencephalitis, alcohol withdrawal syndromes, factitious disorder, malignant hyperthermia, serotonin syndrome and alcohol withdrawal, and others. Viral meningoencephalitis has a good prognosis in general and no specific treatment is required. On the other hand, HSV encephalitis can be a devastating disease with significant morbidity and mortality. Thus, early diagnosis is important. In our patient, euolemic hyponatremia was noted suggesting the presence of the syndrome of inappropriate antidiuretic hormone secretion, which could be a manifestation of central nervous system disturbance. In evaluating patients with fever and negative inflammatory markers, even when a headache is mild, lumbar puncture should be considered to rule out herpes simplex encephalitis, especially in a situation when no alternative diagnosis is made.

CONCLUSION: There are fewer differential diagnoses in patients with fever and negative inflammatory markers than in patients with positive inflammatory markers. In this situation, even when the headache is mild, lumbar puncture should be considered to rule out HSV encephalitis.

THE RELENTLESS SORE THROAT, A CASE OF CHRONIC SEVERE NEUTROPENIA

Marie Claire Lamb; Jordan Minish; Bradley S. Fletcher. UFL, Gainesville, FL. (Control ID #3185639)

LEARNING OBJECTIVE #1: Recognize rare causes of recurrent infections and neutropenia.

CASE: A 63 year old male with a past medical history of malignant melanoma, squamous cell carcinoma of the tonsil, recently diagnosed heart failure with reduced ejection fraction, recently diagnosed pulmonary embolism on warfarin, longstanding hypothyroidism and several false positive syphilis tests presented with a fever of unknown etiology. Patient had had an unrelenting sore throat refractory to several courses of antibiotics and intermittent fevers for the past year. He recently developed diarrhea. On physical exam he had an ulcerated eschar on his right tonsil. He was found to be neutropenic with a white cell count of 1.3 and an absolute neutrophil count of 20. CT scan showed thickening of his right tonsil and splenomegaly of 16cm. He was started on vancomycin, cefepime and metronidazole with improvement of his symptoms. Further laboratory work-up revealed positive antiphospholipid antibodies, lupus anticoagulant, Epstein Barr Virus IgM, Direct Antiglobulin Test IgG and Clostridium Difficile. Bone marrow biopsy showed an abnormal clonal T-cell population with an expanded T-cell receptor subset consistent with T-cell Large Granulocytic Lymphocytic (LGL) Leukemia. He was started on cyclosporin to suppress his immune system

and twice weekly filgrastim to treat his neutropenia. He was discharged on a short course of levofloxacin and close follow-up.

IMPACT/DISCUSSION: LGL Leukemia is a rare lymphoproliferative disorder of the T-cell and Natural Killer cell lineages associated with autoimmunity. There are indolent and aggressive forms. Pathogenesis is hypothesized to be antigen induced monoclonal expansion via Stat3 mutation activation of LGLs. These autoreactive cytotoxic lymphocytes produce cytokines, function as killer cells and avoid apoptosis. Median age of diagnosis is 60 years old and patients present with recurrent infections, oral ulcers, splenomegaly, cytopenias and autoimmunity. This case illuminates the importance of keeping differential diagnoses broad for neutropenia with recurrent infections, as missing one would be catastrophic. It is important to rule out malignancy and full autoimmune work-up is imperative. In this case we saw antiphospholipid syndrome, hypothyroid and possibly related nonischemic cardiomyopathy. Smoldering infection as a cause or consequence of neutropenia must be considered, and a careful history may reveal further associations. LGL leukemia is diagnosed by clinical picture, followed by a blood smear or bone marrow biopsy that demonstrates a clonal LGL population. LGL leukemia that is indolent can be monitored unless it causes severe cytopenias or recurrent infections, in which case we treat. First line is methotrexate, Cyclophosphamide or Cyclosporin as single agents, and G-CSF is added for severe neutropenia.

CONCLUSION: Rare causes of recurrent infections and neutropenia are an important to consider when standard therapies are not working.

THE ROLE OF ECHOCARDIOGRAPHY IN THE WORK-UP OF CHEST PAIN

Michel Farah; Maya Abdallah. UMMS Baystate Medical Center, Springfield, MA. (Control ID #3186316)

LEARNING OBJECTIVE #1: Recognize the importance of thorough history taking in all cases of chest pain, even when the initial diagnosis may seem apparent.

LEARNING OBJECTIVE #2: Recognize McConnell's sign as an echocardiographic pattern associated with acute pulmonary embolism.

CASE: A 38-year-old obese male with history of insulin-dependent diabetes mellitus presented with a several day history of gradually worsening chest pain and dyspnea. Work-up was notable for an electrocardiogram showing T-wave inversions in leads V1-V4 with Q waves in leads III and aVF and elevated cardiac biomarkers. He was treated for acute coronary syndrome and underwent cardiac catheterization which showed chronic occlusion of the left circumflex artery, which could not be stented, but otherwise normal coronary arteries. He continued to experience dyspnea. An echocardiogram was done showing significant right ventricle (RV) dysfunction: severe dilation, reduced systolic function and hypokinesis of the mid-free wall suggestive of McConnell's sign. Acute pulmonary embolus (PE) was suspected. A more detailed history was obtained, with a focus on venous thromboembolic risk factors, and it was discovered that the patient had had prolonged immobilization during travel 2 months prior. Computed tomography angiogram of the chest was done showing bilateral pulmonary emboli in the distal main pulmonary arteries, all lobar arteries and many segmental arteries. He was started on anticoagulation for acute PE.

IMPACT/DISCUSSION: Thorough history taking and avoiding early diagnostic closure are key to appropriate diagnosis and subsequent management of any condition and particularly when life-threatening diseases are being considered. Echocardiogram is an invaluable tool in narrowing the broad differential diagnoses of chest pain. McConnell's sign refers to a distinct echocardiographic pattern of RV dysfunction: regional hypokinesia or

akinesia of the RV mid-free wall with normal motion at the apex consistent with RV pressure overload. This sign has low sensitivity but high specificity for acute PE.

CONCLUSION: The echocardiographic finding of McConnell's sign is not pathognomonic for acute PE but should at least prompt clinical suspicion and further work-up if clinically warranted.

THE ROOT OF THE PROBLEM: A CASE OF SEVERE METABOLIC ALKALOSIS AND HYPOKALEMIA

Matthew R. Mohorek; Elizabeth R. Jacobs. Medical College of Wisconsin, Milwaukee, WI. (Control ID #3183266)

LEARNING OBJECTIVE #1: Recognize glycyrrhetic acid (GZA) toxicity from licorice root as a cause of non-aldosterone mineralocorticoid excess.

LEARNING OBJECTIVE #2: Review clinical ramifications of non-aldosterone mineralocorticoid excess including secondary hypertension, hypokalemia, and metabolic alkalosis.

CASE: A 73-year-old male presented to outpatient bronchoscopy lab for transbronchial needle aspiration. One month prior, the patient had a CT-chest for lung cancer screen which revealed a right apical spiculated lesion later found to be FDG avid. Upon arrival, the patient was asymptomatic but hypertensive with blood pressure 190/108 mmHg. Work-up was remarkable for potassium 1.6 mmol/dL, bicarbonate 52 mmol/dL, pH 7.655, and QTc 748 ms. He was admitted to the ICU for management of metabolic derangements. In ICU, history elicited no prescription medications, but the patient was taking a 4,000 mg daily "liver supplement" with active ingredient *Glycyrrhiza glabra* better known as licorice root. The patient received electrolyte supplementation and was started on spironolactone titrated to 100mg twice daily. He was hospitalized for five days. Follow-up labs eight days after admission revealed complete resolution of metabolic and ECG derangements. Post-discharge bronchoscopy ultimately revealed stage IIIA non-small cell lung cancer.

IMPACT/DISCUSSION: The patient presented with clinical features suggestive of non-aldosterone mineralocorticoid excess due to glycyrrhetic acid (GZA) toxicity. GZA is a constituent of licorice root (*Glycyrrhiza glabra*). Its distinctive sweet flavor makes it a popular sweetener for beverages, gum, and tobacco products. It is also used as an herbal supplement for various medical claims. This patient was consuming approximately 800 mg/day of GZA whereas <100 mg/day is generally considered safe. GZA inhibits 11- hydroxysteroid dehydrogenase, an enzyme that catalyzes the conversion of cortisone to cortisol. Compared to aldosterone, cortisol has equivalent avidity to the mineralocorticoid receptor, so inhibition leads to a mineralocorticoid excess state. Clinically, this excess produces a constellation of abnormalities including hypertension, hypokalemia, and alkalosis. Unique to this case is the severe metabolic alkalosis present which is likely due to enhanced H⁺ secretion by intercalated cells in the collecting ducts of the nephron - a direct result of the luminal electronegativity created by the mineralocorticoid receptor mediated Na⁺/K⁺ ATPase. Mineralocorticoid antagonists like spironolactone are the cornerstone of treatment.

CONCLUSION: GZA is a constituent of licorice root which remains a popular ingredient in sweetened products and herbal supplements. The latter is of particular interest as recommended doses may contain a dangerous level of the substance, as in this case. GZA can cause a non-aldosterone mineralocorticoid excess state leading to hypertension, hypokalemia, and alkalosis. Treatment of GZA toxicity is centered on mineralocorticoid receptor antagonism, most commonly spironolactone.

THE UNEXPECTED FLIGHT DETOUR WITH FEVER AND AN ABDOMINAL MASS

Jun Chih Wang; George DiSeSa; Daniel Matassa; Joshua Kra. Rutgers New Jersey Medical School, Newark, NJ. (Control ID #3171095)

LEARNING OBJECTIVE #1: Recognize the clinical features of lymphoma in patients with HIV

CASE: A 30-year-old Liberian woman with untreated HIV presented with one-day history of generalized weakness and fever that started while flying from Liberia to the United States. She complained of lower abdominal discomfort, weight loss and oligomenorrhea over several months. She denied recent sick contacts or recent infections. She had a fever of 102.7F, pulse 132 bpm, blood pressure 105/64 mmHg. On exam she had a mildly tender lower abdominal mass on palpation, clear lungs and no murmur. Laboratory studies showed WBC 7,000/uL, Hb 4.4 g/dL, platelets 42,000/uL, LDH 878, CD4 243 and a normal chemistry profile. EKG showed sinus tachycardia. Chest x-ray and UA were unremarkable. CT abdomen/pelvis with contrast revealed a 11x7x9cm heterogeneous solid, cystic mass in the pelvis with surrounding hemorrhagic fluid and lymphadenopathy. Despite initial fluid resuscitation, blood transfusion and antibiotics, she continued to be hypotensive and febrile. Due to persistent cytopenia, a bone marrow biopsy was performed but was negative for infectious or neoplastic processes. The pelvic mass was initially thought to represent an incidental finding of a benign mass or a hemorrhagic complex cyst. However, due to minimal improvements with treatments and a non-revealing additional infectious work-up, the patient was eventually taken for a diagnostic laparoscopy and salpingo-oophorectomy. After the operation, the patient's condition stabilized with resolution of hypotension, fevers, and cytopenia. Interestingly, the result of the tissue biopsy of the pelvic mass revealed diffuse large B-cell lymphoma of the ovary.

IMPACT/DISCUSSION: Fever and cytopenia in patients with HIV is often associated with an infectious process; however, autoimmune, malignancy and drug reactions need to be considered. Lymphadenopathy with elevated LDH can be non-specific in this population. In our patient, the association between the septic clinical features and the pelvic mass likely represent a hemorrhagic process with a large tumor burden. Tissue diagnosis remains critical. Lymphoma of the ovary accounts for 0.5% of all non-Hodgkin lymphoma (NHL) and 1.5% of all ovarian neoplasm. The risk of NHL in patients with untreated HIV is as high as 100-fold; despite the use of anti-retroviral therapy (ART), the risk of NHL remains elevated. HIV-related primary ovarian lymphoma has only been reported twice in the literature. Despite its rarity, NHL of the ovary should be considered as a differential diagnosis in patients with untreated HIV presenting with fever and an abdominal mass given the potential to alter treatment. The use of adjuvant chemotherapy after resection is not well-studied but may be of benefit to prevent relapse.

CONCLUSION: Ovarian lymphoma is rare but should be considered in patients with HIV presenting with fever and an ovarian mass. Patients with HIV have an increased risk of HIV-related lymphoma, which remains elevated despite the use of ART

THE WOMAN WHO MISTOOK HER HOSPITAL BED FOR A CANOE

Anna C. Watkins. Brookwood Baptist Health, Hoover, AL. (Control ID #3183973)

LEARNING OBJECTIVE #1: Recognize that amyloid B-related angiitis is a rare disorder with diagnostic imaging and histopathological findings

LEARNING OBJECTIVE #2: Recognize the common presenting signs and symptoms of amyloid B-related angiitis

CASE: A 72-year-old Caucasian female presented with visual hallucinations, memory loss, lethargy, and intermittent headaches of one month duration. The patient was alert, afebrile, and hypertensive with garbled speech and difficulty following commands, but was able to move all extremities equally; otherwise her physical exam was benign. Labs revealed WBC 8, Na 144, ammonia 14, CRP 5, and ESR 71. CT head showed no intracerebral hemorrhage. MRI brain with contrast showed vasogenic edema in the left temporal lobe with minimal associated enhancement and mild mass effect on the temporal horn of the left lateral ventricle. The patient was started on acyclovir for potential HSV encephalitis. A lumbar puncture revealed normal levels of glucose and protein, and was negative for fungi, AFB, neurosyphilis, Cryptococcus, and HSV-1. Acyclovir was stopped. It was suspected that the patient had a glioma, so the temporal lesion was biopsied and stained positively for amyloid B-related angiitis (ABRA). She was started on 1g of methylprednisolone for 7 days then was decreased to 60mg oral prednisone. Her symptoms improved significantly and she was discharged to inpatient rehab where she continued to improve mentally and physically.

IMPACT/DISCUSSION: ABRA is an autoimmune response to naturally occurring beta-amyloid deposition in the cortical and leptomeningeal vessels of the brain that typically occurs in the 7th decade of life with no gender predilection. Patients most commonly present with cognitive and/or behavioral changes ranging from confusion to hallucinations to coma, but can also present with focal neurological deficits, seizures, and/or headaches. ESR and CRP levels are often elevated, but are nonspecific. LP is non-diagnostic, but aids in ruling out other causes of encephalopathy. MRI distinctively shows leptomeningeal enhancement on T2-weighted images often with microbleeds at cortico-subcortical junctions on susceptibility-weighted images, but tissue biopsy is the gold standard of diagnosis. Initial treatment is high-dose corticosteroids followed by a longer duration of low-dose steroids in addition to immunosuppressive drugs. Mortality of ABRA has been reported to be between 7 and 44%, and a number of patients have neurological deficits after treatment. Therefore, timely diagnosis and aggressive, appropriate treatment are the keys to a successful recovery.

CONCLUSION: ABRA is a relatively rare diagnosis with a mortality of 7-44% and with a large number of patients having neurological deficits even after treatment. Therefore, timely diagnosis and aggressive, appropriate treatment are the keys to a successful recovery.

THE WRATH OF HYDROXYCHLOROQUINE: A RECALCITRANT CASE OF ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS

Chay Bae; Navya Kuchipudi; Santhanam Lakshminarayanan. University of Connecticut, Farmington, CT. (Control ID #3183952)

LEARNING OBJECTIVE #1: Distinguish acute generalized exanthematous pustulosis (AGEP) from other rashes.

LEARNING OBJECTIVE #2: Recognize the role of cyclosporine in recalcitrant cases of AGEP.

CASE: A 47 year old female with a history of sjogren's syndrome was started on hydroxychloroquine (HCQ) at 5 mg/kg by her rheumatologist. 4 weeks into HCQ, she developed a rash along her axilla and upper extremity with neutrophilia of 9k/uL. Despite prednisone and withdrawal of HCQ, her rash spread over 6 days. Ultimately, she was referred to us for a second opinion. On exam, she had mild erosions along her tongue and pin-sized, nonfollicular pustules on an erythematous and edematous base along

intertriginous regions, trunk, and extremities. She had neither a Nikolsky sign nor a history of psoriasis. Labs revealed neutrophils of 13 k/uL, ESR of 21 mm, and CRP of 11 mg/L. Although biopsy was histopathologically indeterminant, her findings and the long half-life of HCQ was concerning for a delayed onset of AGEP. She was trialed outpatient on methylprednisolone 1g IV (MIV) for 3 days. This halted new lesions and she transitioned to a prednisone taper. She, however, sought an alternate opinion from dermatology. A concern for pustular psoriasis was raised and her prednisone was aggressively tapered. Regrettably, over 48 hours: she manifested new lesions, had an episode of orthostatic syncope, and presented for admission with neutrophils of 18k/uL, ESR of 58 mm, and CRP of 100 mg/L. Inpatient, she was re-trialed on MIV for 5 days. Despite MIV, she showered lesions in new regions and previous areas of post-pustular desquamation. In this setting, she was re-biopsied, which supported AGEP (corneal pustule and superficial lymphocytic and neutrophilic inflammation). Given the recalcitrance of AGEP, cyclosporine (CSA) was introduced at 4 mg/kg. Within 6 days of CSA, the lesions quiesced and she was discharged. Upon follow up, her CSA was tapered to 1 mg/kg, with concomitant prednisone taper over the next 2 months. At follow up, her rashes had nearly resolved.

IMPACT/DISCUSSION: Despite the use of HCQ in rheumatology, AGEP is a rare side effect. AGEP results from a T-cell mediated type IV hypersensitivity reaction. This manifests as a severe pustular reaction typically within days. Due to HCQ's long half-life; however, it often takes weeks to manifest. This makes it difficult to correlate HCQ to AGEP. This is further muddied by differentials, such as pustular psoriasis. In our patient, AGEP was favored by the nature of polymorphous lesions, no prior history of psoriasis, and biopsy findings. Treatment is discontinuation of medication, supportive care, and systemic steroids in refractory cases. Moreover, this case adds to the sparse literature that CSA may have a role in recalcitrant cases due to its T cell inhibitory effect.

CONCLUSION: This case captures the difficulties of diagnosing HCQ induced AGEP. It also highlights the role of CSA in recalcitrant cases.

THE WRATH OF THE CATH: CARDIAC CATHETERIZATION COMPLICATED BY ACUTE STROKE

Manan Dhingra¹; Michael Hagan¹; Abhishek Thandri²; Maryam Gbadamosi². ¹Creighton University Medical Center, Omaha, NE; ²Creighton university, Omaha, NE. (Control ID #3184705)

LEARNING OBJECTIVE #1: Recognize that embolic strokes are a known but rare complication of cardiac catheterization.

LEARNING OBJECTIVE #2: Recognize that preoperative workups are sometimes unnecessary and can have harmful downstream effects.

CASE: An 84-year-old male with history of hypertension, hyperlipidemia, type II diabetes mellitus, coronary artery disease, 7.3 cm abdominal aortic aneurysm, and cholecystostomy tube in situ underwent coronary catheterization as part of a preoperative evaluation for elective cholecystectomy after a probable single reversible defect in the posterior basilar segment was discovered on a Lexiscan earlier in his preoperative workup. During the procedure, a balloon angioplasty was performed on a stenosis in an existing stent in the distal LAD. Shortly after the procedure, the patient developed diplopia, slurred speech, and left hand and left lower facial numbness. On examination he was found to have internuclear ophthalmoplegia (INO) upon leftward gaze, decreased sensation in the left hand and left lower face, dysmetria on the left, but no focal weakness. He was found to have a NIH stroke scale score of 4. CT head and CTA head/neck showed occlusion in the posterior cerebellar circulation. The patient was deemed a poor candidate for TPA therapy because of the risk of bleeding from his AAA and

from his cholecystostomy tube. The patient had received heparin and Plavix during the cardiac catheterization procedure and had taken a baby aspirin earlier that morning. A high intensity statin was given after the initial workup was completed. An MRI brain was performed the following day that showed infarcts involving the right paramedian midbrain and cerebellum. A transthoracic echocardiogram with bubble study showed no intracardiac thrombus, vegetations, or any intracardiac shunt. Over the next few days, the decreased sensation of the left face and left hand resolved, but the dysarthria, diplopia, and INO persisted. The patient was discharged to a skilled nursing facility for further rehabilitation upon discharge. He will be reassessed as a surgical candidate for cholecystectomy and AAA repair as an outpatient.

IMPACT/DISCUSSION: This case illustrates the complications involved with cardiac catheterization. These complications are rare but need to be considered in patients with multiple risk factors. This case also illustrates that preoperative workups are not always benign. On many occasions, a clinician is able to determine from the clinical picture that a patient is not a good surgical candidate but will go ahead with extensive preoperative workup just to confirm their assessment. These workups not only drain time and money from the healthcare system but can expose the patient to many unintended risks.

CONCLUSION: 1. Embolic strokes are a known but rare complication of cardiac catheterization. 2. Inappropriate preoperative workups not only drain time and money from the healthcare system but can expose the patient to many unintended risks.

THESE CUFFS DON'T LIE: AN ATYPICAL PRESENTATION OF A COMMON CONDITION

David Hess¹; Brian Lewis¹; David Feldstein²; Linda Baier². ¹University of Wisconsin, Madison, WI; ²University of Wisconsin School of Medicine and Public Health, Madison, WI. (Control ID #3184533)

LEARNING OBJECTIVE #1: Recognize hypothyroidism as a cause of new or worsening hypertension in the absence of other classic symptoms.

LEARNING OBJECTIVE #2: Appropriately screen patients with a history of radiation therapy to the neck for hypothyroidism.

CASE: A 75-year-old man with a history of hypertension and idiopathic cardiomyopathy presented to his primary care physician with elevated blood pressure. His home blood pressure ranged from 150/110 to 170/120 over the past 5 days. He also complained of fatigue and generally feeling unwell. He denied any constipation, cold intolerance, changes in skin or hair, weight changes, headache, visual changes, chest pain, or shortness of breath. His hypertension was previously well controlled with losartan and metoprolol succinate. He was diagnosed with squamous cell carcinoma of the tongue 5 years ago and curatively treated with radiation. Exam was notable for a BP of 182/105. Losartan was increased and a limited workup for secondary causes of hypertension was performed, showing stable renal function and a TSH of >100 with free T4 of 0.60. Levothyroxine was initiated for hypothyroidism. Over 12 weeks, his blood pressure improved and his TSH normalized. He was able to return to his prior anti-hypertensive regimen with good control.

IMPACT/DISCUSSION: Hypothyroidism is commonly managed in primary care. Recognizing its presentation with worsening hypertension is critical. The variety of clinical symptoms of hypothyroidism can be broad, however it is notable that as much as 30% of people with hypothyroidism have hypertension, particularly diastolic hypertension. For the majority of patients with secondary hypertension due to hypothyroidism, hypertension resolves with appropriate hypothyroidism treatment. This patient was at

increased risk of hypothyroidism given his previous neck radiation, but was not being monitored for this. Hypothyroidism is a common adverse effect of neck radiation, with reports of up to 33% of patients suffering from clinical hypothyroidism. Most develop hypothyroidism within 2 years of radiation, however onset of greater than 5 years after completion of radiation is not uncommon. The National Comprehensive Cancer Network guidelines recommend screening for hypothyroidism with a TSH every 6-12 months indefinitely. In this case, the patient may have avoided the hypertensive urgency if he had been appropriately screened. As a result of this case, I will be more vigilant in evaluating for hypothyroidism in patients with diastolic hypertension. Additionally, now knowing the recommended screening guidelines for patients with neck radiation, I will ensure my patients with this history have at least a yearly evaluation of TSH.

CONCLUSION: - It is important to be vigilant in assessing for hypothyroidism in patients with new onset or worsening diastolic hypertension even in the absence of other classic symptoms. - Patients are at high risk of hypothyroidism after neck radiation and should be screened every 6-12 months.

THIRD TIME'S THE CHARM: DIAGNOSIS OF ADULT ONSET STILL'S DISEASE AFTER REPEAT ADMISSIONS FOR FEVER

Katherine Gavinski; Michael Burton. UT Southwestern, Dallas, TX. (Control ID #3177803)

LEARNING OBJECTIVE #1: Construct a systematic approach to evaluation of fever of unknown origin (FUV).

LEARNING OBJECTIVE #2: Recognize diagnostic errors present in complex patient evaluations.

CASE: Mrs. G is a 35-year-old African woman who presented with a multi-week history of fevers, malaise, and rash. She initially developed a pruritic rash to her extremities—treated as an allergic reaction. She was soon hospitalized with fever, weakness, and abdominal pain; workup notable for acute renal injury, leukocytosis, microcytic anemia, thrombocytopenia, coagulopathy, hemolysis, and hypercellular bone marrow; negative infectious workup. She was discharged after IV antibiotics, but soon readmitted with recurrent fevers, disabling knee arthralgias, transaminitis, elevated acute phase reactants, ferritin 56, and nonspecific lymphadenopathy and hepatosplenomegaly. Rickettsia antibody was weakly positive—no history of travel or unusual exposures—so discharged on doxycycline for presumed murine typhus. At home, Mrs. G developed a hypertrophic rash and stopped doxycycline. She was admitted again weeks later for fever, malaise, and maculopapular rash with warm autoimmune hemolytic anemia, acute kidney injury, and ferritin 12,000. Skin biopsy showed persistent, atypical eruption of adult Still's disease. She had rapid clinical improvement with IV steroids.

IMPACT/DISCUSSION: Although adult Still's disease is rare, this case serves as an excellent example of the diagnostic workup for a FUV and common errors in clinical reasoning. FUV workup requires rigorous evaluation for infection, malignancy, and rheumatologic processes, which should be informed by a patient's history and exposures. Despite a conclusive final diagnosis, this case was subject to errors in clinical reasoning. Mrs. G's initial management consisted of testing and treatment for bacterial etiologies of fever. Availability bias makes bacterial infection an accessible diagnostic category, but after lack of response to treatment or positive test, should be abandoned. During her second admission, a positive antibody for Rickettsia was found. Despite a lack of exposure and weak antibody titer, confirmation bias and premature closure led to another incorrect diagnosis. The low ferritin led to the cognitive bias of blind obedience—placing undue

reliance on test results—that caused us to initially dismiss the idea of adult Still's disease. Ultimately, her diagnostic workup required re-framing of her signs and symptoms of disease, repeated testing, and pathologic confirmation to appropriately identify a unifying diagnosis.

CONCLUSION: *Thorough history taking and careful review of patient's records can help elucidate a difficult diagnosis. *If a diagnosis does not fit the clinical information available, renewed effort should be made to identify an alternative diagnosis and avoid errors in reasoning.

THIRD TIMES THE CHARM: A RARE CASE OF RECURRENT PANCREATITIS AND THE IMPORTANCE OF MEDICATION RECONCILIATION

Rusdeep Mundae; Seth J. Lichtenstein; Ashley Shah. Rush University Medical Center, Chicago, IL. (Control ID #3186221)

LEARNING OBJECTIVE #1: Recognize the challenges in identifying drug-induced pancreatitis

LEARNING OBJECTIVE #2: Perform a thorough history and medication review

CASE: A 57-year-old woman with a past medical history of diabetes mellitus type 2 presented with a two day history of sharp epigastric pain radiating to the back, associated with nausea and vomiting. She denied alcohol, smoking, or drug use. She denied any previous abdominal surgeries. Her vitals on admission were stable. Her exam was notable for epigastric tenderness with deep palpation. Labs showed a serum creatinine 1.2 mg/dL, calcium 9.8 mg/dL, and lipase 2,539 U/L. An abdominal ultrasound was negative for gallstones and a triglyceride level was normal. Upon review of home medications, she was prescribed trimethoprim-sulfamethoxazole (TMP/SMX) for a urinary tract infection (UTI) 5 days prior to admission. On further investigation, the patient was noted to have two admissions in 2015 and 2018 for acute pancreatitis, previously thought to be of unknown etiology. However, thorough review revealed that the patient was prescribed TMP/SMX for a UTI prior to each of these admissions. She was treated with fluid resuscitation, pain control, and diet advancement. She improved clinically and was discharged without sequelae after several days. Patient was educated on the etiology of her recurrent pancreatitis and TMP/SMPX was added to the patient's allergy list.

IMPACT/DISCUSSION: Drug induced pancreatitis (DIP) is a rare entity. The true incidence of DIP remains unclear as evidence primarily consists of isolated case reports; however it is estimated to account for approximately 0.1-2% episodes of acute pancreatitis. The diagnosis of DIP is particularly challenging because it rarely presents with clinical or laboratory evidence that would differentiate it from other causes of acute pancreatitis. DIP is typically a diagnosis of exclusion and is established by assessing the temporal relationship between drug administration and development of acute pancreatitis, or a positive re-challenge with the suspected drug given the lack of other causes. A thorough history, physical, and medication review, is essential in guiding medical decision-making and reducing hospital readmissions for DIP. TMP/SMX is a relatively rare cause of DIP, but there have been several case reports, including one documented report of a re-challenge. This suggests a causal relationship; however, the pathologic mechanism remains unknown. While other sulfonamides have been implicated in causing DIP, it is unclear if the sulfa-moietry of TMP-SMX is in fact the offending agent.

CONCLUSION: DIP is a very rare, but potentially life-threatening diagnosis that is best established by a thorough history and review of a patients past medical history and medication use. Early identification, initiation of appropriate treatment, and withdrawal of the offending agent can aid in

preventing worsening disease progression, reducing morbidity, and decreasing hospital readmissions.

THREE'S A CROWD: A CASE OF HEPATITIS B, C, AND D CO-INFECTION IN A PERSON WHO INJECTS DRUGS

Jill Harrington¹; Jessica Taylor². ¹Boston Medical Center, Boston, MA;

²Boston Medical Center, Boston, MA. (Control ID #3185769)

LEARNING OBJECTIVE #1: Test for hepatitis D in patients with hepatitis B at increased risk for co-infection.

LEARNING OBJECTIVE #2: Describe the treatment and prognostic implications of viral hepatitis co-infection.

CASE: A 49-year-old man with a history of substance use disorder and injection drug use presented to the Emergency Department (ED) for musculoskeletal back pain. Labs were ordered; because of an ED initiative to identify cases of hepatitis C (HCV), an HCV antibody assay was sent and returned reactive with a viral load of 20,774 IU/mL. He was diagnosed with genotype 1A HCV, likely chronic, and outpatient follow-up was arranged. At his next visit, the patient reported no symptoms of HCV and was interested in treatment. Additional lab tests and imaging were ordered to stage his liver disease and inform selection of direct acting antiviral therapy (DAA). Hepatitis B virus (HBV) serologies suggested HBV co-infection. Follow-up labs confirmed active, e antigen positive, e antibody negative HBV with a high viral load of >170,000,000 IU/mL. Because of the patient's history of injection drug use, a hepatitis D virus (HDV) antibody was sent and returned positive. Although the patient's primary care physician manages HCV, this patient was referred to Hepatology for management of possible HBV, HCV, and HDV co-infection. Fortunately, his HDV viral load was undetectable, indicating cleared HDV. Because of the risk of a HBV flare during and after DAA therapy for HCV, the patient was started on tenofovir for his HBV with the plan to start HCV treatment once an adequate HBV viral load response is achieved.

IMPACT/DISCUSSION: The development of DAAs for HCV has revolutionized treatment and expanded access to high risk populations. Testing for viral co-infection is a crucial component of the HCV pre-treatment evaluation. HDV is an RNA virus that requires the presence of HBV surface antigen (HbSAg) for replication; patients with HBV/HDV co-infection have higher mortality and a more rapid progression to cirrhosis, which underscores the importance of recognizing HDV. The American Association for the Study of Liver Disease recommends testing for HDV in patients with a positive HbSAg at increased risk, including PWID, MSM, people with HIV or HCV co-infection, and people from endemic areas. Studies have estimated that up to one third of HbSAg positive PWID also have chronic HDV. However, HDV testing is not done consistently. When HBV or HBV/HDV are identified in a patient with chronic HCV, the treatment implications are significant. Due to risk of a HBV flare during or after DAA therapy, patients with HBV co-infection may need to begin HBV treatment or undergo additional monitoring. The treatment approach for patients with HBV/HCV/HDV co-infection is more complex as interferon is the only agent with known HDV activity.

CONCLUSION: Screening for HBV co-infection is an essential part of the HCV pre-treatment evaluation. Patients with a positive HbSAg who have a history of injection drug use or other risk factors for HDV, should be screened for HDV.

THYROTOXIC PERIODIC PARALYSIS RESULTING IN ACUTE RESPIRATORY FAILURE

Charit Taneja¹; Gorav Sharma¹; Bryan Blase¹; Lubna B. Munshi². ¹Icahn

School of Medicine, Mount Sinai Beth Israel, New York, NY; ²The Ohio

State University, Wexner Medical Center, Columbus, OH. (Control ID #3139709)

LEARNING OBJECTIVE #1: Recognize the respiratory complications of thyrotoxic periodic paralysis

LEARNING OBJECTIVE #2: Suspect impending respiratory failure and need for ICU level of care in these patients

CASE: A 34 year-old Hispanic male with a history of asthma presented to the ER with acute onset of bilateral upper and lower extremity muscle weakness. Two weeks prior to onset, he had a flu-like illness with fever, chills and productive cough, which caused an asthma exacerbation; leading him to use his albuterol inhaler 5-6 times daily along with a course of oral steroids. On admission, he was afebrile and vitals were BP 155/98 mmHg, HR 102 bpm, pulse oximetry 100% on room air. Physical exam was significant for 2/5 strength in bilateral upper and lower extremities at all joints in all ranges of motion. Laboratory studies revealed potassium 2.1 mmol/L, magnesium 1.3 mg/dL and inorganic phosphorus 0.9 mg/dL. Thyrotropin level was 0.1 mIU/L with a free T4 of 1.37 and T3 of 82. Thyroid autoantibodies were negative. Chest radiograph was unremarkable. Further history was significant for a hospitalization 5 years ago for paralysis in the setting of hypokalemia secondary to a "thyroid problem". Following the resolution of symptoms during this prior episode, he was discharged and subsequently lost to follow-up. Over the next few hours, electrolytes were repleted, yet his muscular weakness worsened rapidly. He became tachycardic and tachypneic with progressive respiratory distress. As a result, the patient was intubated for respiratory support. He was diagnosed with thyrotoxic periodic paralysis and treated with methimazole and propranolol along with concurrent potassium repletion. He responded appropriately, with full resolution of weakness and normalization of electrolytes. He was discharged with close outpatient endocrinology follow-up.

IMPACT/DISCUSSION: Thyrotoxic periodic paralysis is a subset of hypokalemic periodic paralysis (PP) usually seen in young Asian males with hyperthyroidism, and classically presents with proximal muscular weakness, more prominent in the lower extremities. Later age of onset (usually >20 years), findings of hypophosphatemia and hypomagnesemia can be used to distinguish thyrotoxic PP from familial hypokalemic PP. Beta-2 adrenergic bronchodilators and corticosteroids are both known to precipitate attacks by enhancing hypokalemia. Most cases respond rapidly to electrolyte repletion and rarely progress to involve respiratory muscles requiring ventilatory support as seen in our patient.

CONCLUSION: Thyrotoxic periodic paralysis is a rare disorder with potentially grave consequences, including respiratory failure from muscle paralysis and arrhythmias secondary to profound electrolyte disturbances. A high degree of clinical suspicion should always be observed, with patients ideally monitored in the ICU setting and close coordination between intensivists and endocrinologists.

THYROTOXIC PERIODIC PARALYSIS: A RARE MANIFESTATION OF HYPERTHYROIDISM

Alen Sajan¹; Maushmi Savjani²; Rebecca Mazurkiewicz¹; Samy McFarlane³.
¹Lenox Hill Hospital, New York, NY; ²Penn State, Hershey, PA; ³SUNY Downstate, Brooklyn, NY. (Control ID #3186339)

LEARNING OBJECTIVE #1: Recognize an unusual presentation of a rare complication of thyrotoxicosis associated with IV contrast.

CASE: A 73 year-old Black woman with history of Grave's disease (not adherent to methimazole), atrial fibrillation, hypertension, and diabetes mellitus presented to the Emergency Department with palpitations and

dyspnea at rest for a few hours. She had increased frequency of bowel movements for several days, but no fever, chest or abdominal pain, nausea, vomiting, restlessness, diaphoresis, or insomnia. Vital signs were significant for tachycardia at 113 bpm, respiratory rate of 26 and oxygen saturation of 98% on 2 L/min nasal cannula. Exam findings included exophthalmos, diffuse thyromegaly with bruit and 2+ pedal edema. Her potassium level was 3.8 mEq/L. Thyroid function tests (TFTs) were thyroid stimulating hormone (TSH) <0.008 U/mL, serum total thyroxine (TT4) >30 ng/dL, and triiodothyronine (T3) uptake 49.82%. She was admitted for thyrotoxicosis with a Burch-Wartofsky Point Scale score of 30, and treatment with methimazole, propranolol and hydrocortisone was initiated. Her course was complicated by acute onset flaccid paralysis after receiving a CT scan with IV radiocontrast to evaluate for possible tracheal obstruction by the goiter. At this time, her neurological exam was remarkable for 0/5 motor strength with hyporeflexia and intact sensation in all extremities and mute plantar reflexes. MRI of the brain and cervical spine showed no acute stroke or transverse myelitis. A diagnosis of Thyrotoxic Periodic Paralysis (TPP) was made, which is known to be associated with hypokalemia.

IMPACT/DISCUSSION: TPP is a well characterized acute onset flaccid paralysis known to occur in the setting of hyperthyroidism and hypokalemia. TPP has been linked to a variety of precipitants from states of physiologic stress to strenuous activity. Thyroid hormone is presumed to play a key role in upregulation of sodium-potassium ATPase activity that drives potassium into the cell, causing hypokalemia and subsequent hyperpolarization of muscle cell membranes leading to inexcitability of skeletal muscles [1]. This case was induced by iodine contrast while the potassium level was within normal limits. There is a similar case reported in 2006, where a patient with hyperthyroidism developed TPP after receiving contrast during cardiac catheterization with potassium level of 3.0 mEq/L [2]. Our patient was on treatment for thyrotoxicosis for a full week with 50% decrease in her serum total T4 level (13.3 µg/dL) at the onset of paralysis. Yet she developed TPP within hours of receiving the contrast. The patient regained the majority of her muscle strength without any respiratory complications within 72 hours after continued treatment with methimazole, steroids and propranolol. Restoring euthyroidism generally reverses the paralysis, as in this case [1].

CONCLUSION: Contrast should be avoided or cautiously used in patients with thyrotoxicosis to prevent possible precipitation of TPP.

THYROTOXIC PERIODIC PARALYSIS: A REFLEXIVE DIAGNOSIS

Samantha J. Allen¹; Juan N. Lessing¹; Mel Anderson^{1, 2}. ¹University of Colorado, Denver, CO; ²Department of Veterans Affairs, Aurora, CO. (Control ID #3185107)

LEARNING OBJECTIVE #1: Perform a pertinent exam and obtain appropriate studies on a patient complaining of weakness

LEARNING OBJECTIVE #2: Recognize thyrotoxic periodic paralysis as a distinct etiology for weakness in a hyperthyroid patient

CASE: A 43-year-old woman presented with one week of weakness, seven kilograms unintentional weight loss, palpitations, and heat intolerance. She had a history of panhypopituitarism following Rathke's cleft cyst resection. Medications included levothyroxine, prednisone, transdermal estrogen, and medroxyprogesterone injections. Her vital signs were notable for tachycardia (HR 105) and weight 80 kg (87 kg 3 weeks prior). HEENT, chest, lung, and abdominal exams were normal. Bilateral thighs and calves were tender to palpation. Strength was intact in the upper extremities and symmetrically diminished in the lower extremities. She could not rise out of a chair or walk without support. Deep tendon reflexes were diminished in the upper

extremities and absent in the lower extremities. Neurologic exam was otherwise normal. CBC was normal. ESR was 34 (0-20), CRP was 7.77 (3), and creatine phosphokinase was 190 (19-131). Potassium was 2.8 with an otherwise normal BMP. TSH was undetectable. Free thyroxine was 2.43 (1-1.85). Her musculoskeletal and neurologic exams, along with potassium level and thyroid function tests, pointed toward a diagnosis of thyrotoxic periodic paralysis (TPP). It was noted that her levothyroxine dose was increased 6 weeks prior in response to an elevated thyroid stimulating hormone level on surveillance labs. She now disclosed that at that visit, she had not been forthcoming about inconsistent levothyroxine use; therefore, the dose increase was inappropriate and caused iatrogenic hyperthyroidism complicated by TPP. Symptoms resolved within hours of potassium supplementation. Levothyroxine dose was decreased and follow-up arranged.

IMPACT/DISCUSSION: TPP, like other forms of hypokalemic periodic paralysis, is a membrane channelopathy. One channel that plays a role is Kir 2.6, a potassium channel regulated by thyroid hormone. TPP is characterized by intermittent attacks of proximal muscle weakness and, rarely, respiratory muscle failure. It is more common in men, despite the overall female predominance of thyrotoxicosis. A useful distinguishing finding is deep tendon reflexes, which are absent or diminished in TPP but exaggerated in thyrotoxicosis. Treatment is potassium replacement, management of thyrotoxicosis, and treatment of the underlying thyroid disorder.

CONCLUSION: Weakness is a common symptom encountered by inpatient and outpatient internists. Differential diagnosis is guided by assessing for objective weakness and determining weakness distribution. Thyroid disorders should be considered in the differential diagnosis for weakness. Furthermore, when diminished reflexes, hypokalemia, and thyrotoxicosis are also present, TPP should be considered.

TITLE: A PEDIATRIC RASH IN A GERIATRIC CLINIC

Jared Schprechman. Naples Community Hospital, Naples, FL. (Control ID #3184903)

LEARNING OBJECTIVE #1: Recognize IgA vasculitis in adults

LEARNING OBJECTIVE #2: Distinguish IgA Vasculitis from other vasculitides by history and laboratory analysis

CASE: A 69-year-old non-smoking male with no PMH presented to the clinic with diffuse joint pain and extensive non-pruritic and non-painful rash on his lower extremities that progressed over the past week. He denied any recent travel, over the counter supplements, new medications, occupational exposure to chemicals, or excessive time in the sunlight. ROS was negative. Vitals: BP 128/82, HR 65, and temp 37 degrees Celsius. Physical exam revealed a diffuse erythematous rash with palpable purpura on his legs without ulceration, nodules or livedo reticularis. He had no joint synovitis and a normal neurological exam. Labs showed an increased creatinine of 1.5 mg/dL from 1.0 mg/dL baseline, 1+ urine protein on UA, urine protein/creatinine ratio of 1, suggesting overt proteinuria and no microscopic or gross hematuria. His p-ANCA, c-ANCA, cryoglobulin, ANA, and viral hepatitis antibodies were all negative. Skin biopsy showed neutrophilic predominant small vessel vasculitis. A kidney biopsy revealed mesangial proliferative glomerulonephritis and IM findings revealed granular mesangial positivity for IgA, IgM, C3, fibrinogen and kappa and lambda. These findings were consistent with IgA vasculitis. He was started on lisinopril 5 mg daily and prednisone 30 mg daily, which was tapered over the course of 5 months. His rash resolved within 4 months and his proteinuria resolved within 8 months.

IMPACT/DISCUSSION: IgA vasculitis, once known an Henoch-Schonlein purpura, occurs more than 90% of the time in children. However, its cardinal symptoms of palpable purpura, arthritis, abdominal pain and renal disease are

shared by all age groups. Adults are more likely to have renal disease manifesting in hypertension, nephrotic syndrome and decline in GFR as opposed to isolated proteinuria and hematuria in children. Intussusception is rare in adults. IgA vasculitis may present similarly to other small vessel vasculitides which present with purpura. In the absence of biomarkers including ANCA, one can rule out microscopic polyangiitis (MPA), granulomatosis with polyangiitis (GPA), and Churg-Strauss. A negative ANCA can help make MPA, GPA, and Churg-Strauss less likely. Having negative cryoglobulins, no focal nerve deficits, and no history of hepatitis or connective tissue disease also rules out cryoglobulinemia. While medium-vessel vasculitides such as polyarteritis nodosa may present similarly with renal disease as well, it typically includes sensory and motor deficits as well as skin manifestations such as ulceration, nodules and livedo reticularis.

CONCLUSION: IgA vasculitis can be recognized in adults most often by palpable purpura and worsening renal disease. Key distinguishing factors from other vasculitides include negative ANCA, negative cryoglobulins and a lack of neuro deficits and any other skin findings.

TO B19 AGAIN: TRANSIENT APLASTIC CRISIS IN HEMOGLOBIN SC DISEASE

Bridget Azera^{1, 2}; Odeth Barrett-Campbell^{1, 2}; Andrew A. Chang^{1, 2}. ¹NYC Health + Hospitals/Kings County, New York, NY; ²SUNY Downstate Medical Center, Brooklyn, NY. (Control ID #3185881)

LEARNING OBJECTIVE #1: To identify and treat Parvovirus B19 transient aplastic crisis (TAC) in patients with Hemoglobin SC disease (HbSC)

CASE: A 22-year-old African American woman with HbSC presented with one day of severe lower back and bilateral leg pain, not relieved by ibuprofen. Review of systems was otherwise negative. Initial exam revealed mucosal pallor, scleral icterus, absence of hepatosplenomegaly and diffuse tenderness across the lower back with no focal neurologic deficits. The pain improved with the use of hydromorphone and ketorolac. However, by day 3 of admission, she complained of generalized weakness and dyspnea on exertion. She denied cough, fever, runny nose or sore throat. Labs at that time showed hemoglobin (Hgb) 6.1g/dL (a decline from 9.4g/dL on admission), WBC 7.23 x 10⁹/L, Reticulocyte index was 1.6%, Haptoglobin <10 mg/dL, Total bilirubin 1.6 mg/dL and LDH 1049 U/L. No schistocytes were seen on peripheral smear. Parvovirus IgM and IgG antibody titers were elevated. A diagnosis of Parvovirus B19 transient aplastic crisis (TAC) was made, based on decline in Hgb, reticulocytopenia and elevated Parvovirus B19 IgM titers. 2 units of RBCs were given with appropriate increment in Hgb which remained stable over 2 days before she was discharged.

IMPACT/DISCUSSION: Patients with sickle cell anemia (HbSS) are particularly susceptible to Parvovirus B19 infection due to asplenia and can lead to TAC due to the cessation of red blood cell production. Parvovirus B19 accounts for most TAC particularly among children with HbSS disease. In contrast, patients with HbSC disease often have less frequent crises which may delay presentation of Parvovirus B19 TAC to adulthood as in our patient. TAC should be suspected when there is an acute fall in Hgb that is not accompanied by an appreciable bone marrow response in red cell production. Symptoms usually are due to acute on chronic anemia with varying severity but can be life-threatening, highlighting the need for early recognition. Other Parvovirus B19 related complications such as acute chest syndrome, acute splenic or hepatic sequestration and bone marrow necrosis can occur concomitantly with aplastic crisis. Serum IgM testing is recommended for immunocompetent patients and immunocompromised should be tested by viral DNA. Treatment is usually supportive with antipyretics or ibuprofen (if fever is present) and blood

transfusions if symptomatic. Recurrence of infection is rare due to development of immunity.

CONCLUSION: - HbSC often has a milder clinical course compared to HbSS, which can delay asplenia and its infectious complications. - TAC should be on the considered in HbSC patients and treated aggressively if symptomatic.

TO BELL OR NOT TO BELL: A CASE OF ATYPICAL FACIAL NERVE PALSY

Niharika Mallepally; Jules Ryan Tabilona; Lee Lu. Baylor College of Medicine, Houston, TX. (Control ID #3186090)

LEARNING OBJECTIVE #1: Recognize the gradual onset of symptoms in malignant facial nerve schwannoma (FNS).

LEARNING OBJECTIVE #2: Review the treatment of malignant FNS.

CASE: A 54-year-old female with a history of Bell's palsy presented for an annual well exam. Eighteen months ago, she developed left jaw and facial pain followed by a slow onset of left facial weakness, numbness and inability to close her left eye. These symptoms progressively worsened over 6 months. She was diagnosed with Bell's palsy. Her left facial weakness continued to worsen. She denied hearing loss, tinnitus, vertigo, or other neurological symptoms. Physical exam noted left sided facial paralysis, decreased sensation, and inability to close the left eyelid. Due to the unusual gradual progression of her facial symptoms, an MRI of the orbit was performed and showed diffuse enhancement of the middle ear and mastoid cavities extending through the mastoid foramen. A follow up CT scan of the temporal bone noted a soft tissue mass with aggressive features in the left mastoid cavity with osseous erosion and local extension to the left external auditory canal and middle ear cavity and involvement of the left facial nerve. A biopsy of the mass revealed a malignant tumor with schwannian features. She was diagnosed with malignant FNS and is awaiting surgical excision.

IMPACT/DISCUSSION: Facial nerve schwannoma is a rare tumor arising from schwann cells surrounding the facial nerve. Though comprising less than 1% of temporal bone tumors, FNS is the most common type of facial nerve tumor. FNS presents with facial nerve paralysis, decreased sensation, tinnitus, hearing loss, pain, and dizziness. Symptom onset usually is slowly progressive over months. On initial presentation, FNS is often misdiagnosed as either vestibular schwannoma or Bell's palsy. Diagnosis is made by MRI imaging showing auditory canal mass with extension to the facial nerve and histopathology. Management can be conservative with serial imaging, and the reported tumor growth is 1.4mm annually. Alternatively, stereotactic radiosurgery is a treatment option. Preservation of the facial nerve is a surgical priority, and post-operative improvement in paralysis and paresis is variable. Treatment decisions are based on symptom severity and baseline nerve and hearing function. Though the majority of FNS is benign, <10% of all FNS can be malignant, as was the case in our patient. Malignant tumors have aggressive growth and are almost always managed surgically.

CONCLUSION: Unlike the common Bell's palsy's acute presentation, the onset of malignant FNS is gradual; it should be recognized and diagnosed promptly. In a high technological medicine era with less time spent with patients, this case reminds physicians of Sir William Olser's teaching- "Just listen to your patient."

TO CLOT OR TO BLEED: THROMBOSIS AS A FIRST SIGN OF MICROSCOPIC POLYANGIITIS

Kajali Mishra; Sandra Naffouj; Sarah Gorgis. Henry Ford Hospital, Detroit, MI. (Control ID #3185940)

LEARNING OBJECTIVE #1: Recognize ANCA-associated vasculitis in a patient with thrombosis

LEARNING OBJECTIVE #2: Management of diffuse alveolar hemorrhage in the setting of acute thrombosis

CASE: A 59-year-old female with a history of stroke with residual right-sided weakness presented with dyspnea and lower extremity swelling. She was febrile, tachycardic, and required supplemental oxygen (O2). Laboratory studies showed an acute kidney injury (AKI). Lower extremity dopplers revealed bilateral deep vein thrombosis (DVT), and she was started on heparin for DVT and presumed pulmonary embolism (PE). Computed tomography (CT) PE was not performed due to AKI. Chest xray showed bilateral airspace opacities, so antibiotics were started. The patient clinically worsened and developed hemoptysis with increasing O2 requirements. CT chest showed concern for alveolar hemorrhage. Anticoagulation was stopped and the patient was intubated. Bronchoscopy confirmed diffuse alveolar hemorrhage. Rheumatologic workup showed ESR 111, ANA 1:320 (speckled), and positive MPO (p-ANCA) of 115. Left kidney biopsy revealed focal segmental necrotizing and crescentic glomerulonephritis consistent with ANCA-associated pauci-immune glomerulonephritis, microscopic polyangiitis (MPA). Plasmapheresis and hemodialysis was started due to worsening kidney function. She clinically improved, was extubated, and eventually weaned off oxygen. Induction with Cyclophosphamide and high-dose steroids was begun. Her AKI resolved, no longer requiring dialysis. After a risk-benefit discussion, warfarin was started, and the patient returned home. She was transitioned to maintenance therapy on Azathioprine and remained clinically stable at her three year follow up.

IMPACT/DISCUSSION: We present a case of thrombosis as a first sign of severe microscopic polyangiitis. The most common clinical symptoms of MPA include fatigue, cough, dyspnea, and arthralgias. Although it is a pulmonary-renal syndrome, renal insufficiency is only present in 18% of patients on presentation. In our patient, a DVT (originally thought to be due to immobilization from stroke) was the first sign of extensive MPA. The accompanying respiratory symptoms were presumed to be due to PE, and therefore a CT scan was not initially performed. The etiology of the hypercoagulable state in such patients is unclear, but circulating antiplasminogen antibodies have been demonstrated in those who develop clots. This case was further complicated by diffuse alveolar hemorrhage, a rare but life-threatening complication of MPA. Immunosuppressive therapy is required in almost all patients with active disease.

CONCLUSION: Patients with ANCA-associated vasculitis have a high risk of thrombosis, but it is rarely the presenting sign. Suspicion in patients with concomitant renal insufficiency and pulmonary symptoms can lead to early diagnosis. Despite being hypercoagulable, anticoagulation may not be the appropriate initial treatment as pulmonary hemorrhage can worsen outcomes.

TO CUT OR NOT TO CUT? A CASE OF ISOLATED PULMONIC VALVE ENDOCARDITIS

Aravind Seetharaman¹; Katie Cohen¹; Sarah Nickoloff^{1, 2}. ¹Medical College of Wisconsin, Milwaukee, WI; ²Zablocki VA Medical Center, Milwaukee, WI. (Control ID #3167561)

LEARNING OBJECTIVE #1: Recognize the clinical manifestations of pulmonary valve endocarditis.

LEARNING OBJECTIVE #2: Identify high-risk patients who would benefit from cardiovascular surgery evaluation.

CASE: A 70-year-old male with history of hypertension, obstructive sleep apnea, and alcohol abuse was admitted for severe dyspnea, a 30-pound weight loss, and fever. Blood cultures grew Enterococcus faecalis. A new

heart murmur was auscultated, and transthoracic echocardiogram (TTE) showed a 3.8 x 0.5 cm pulmonic valve (PV) vegetation. Confirmatory transesophageal echocardiogram revealed a 4.0 x 1.0 cm mobile mass in the RV outflow tract attached to the base of the right cusp of the PV. Treatment with ampicillin and ceftriaxone was initiated. Moderate to severe pulmonary regurgitation and cusp prolapse into the RV outflow tract were seen on cardiac MRI. Cardiothoracic surgery (CTS) was consulted. However, given the patient's stable cardiac function, absence of heart block on EKG, and multiple medical comorbidities, CTS deferred surgical intervention. Despite ongoing treatment with IV antibiotics, the patient had recurrent febrile episodes with hemodynamic instability, and concern for septic embolization was raised. He was transferred to the affiliate hospital for a second opinion by CTS, who again deferred surgical intervention. Surveillance TTE showed decrease in size of the known mass to 2.7 x 0.6 cm, a second 1.8 x 0.3 cm mass, and severe PV regurgitation with moderate RV enlargement but normal RV systolic function. Repeat TTE two weeks later showed slight enlargement of masses. CTS again evaluated the patient, and continued to recommend medical management, given high risk and uncertain benefit of surgical intervention. He was ultimately discharged home with planned serial TTE re-evaluation.

IMPACT/DISCUSSION: Initial treatment of isolated pulmonic valve endocarditis is usually medical. Our patient's high-risk features such as vegetation size >20 mm, recurrent pulmonary emboli, severe pulmonary regurgitation and development of new, additional vegetations while on broad-spectrum antibiotics made a compelling case for surgical intervention. However, CTS did not feel that benefit of surgical intervention outweighed risk, and our patient was therefore managed medically.

CONCLUSION: Isolated PV infective endocarditis (IE) is a very rare finding. The rarity of PV IE has been attributed to the lower pressures of the right heart, lower incidence of congenital/acquired valve abnormalities, lower oxygen content of venous blood, and differences in the endothelial lining and vascularization of the valve. There are clearly defined criteria for surgery in left-sided IE. However, guidelines for surgery in right-sided IE are much less clear. Conservative medical management is often recommended, as right-sided heart valve infections are thought to be more responsive to antibiotics and better tolerated than mitral or aortic valve infections. However, further research is needed to elucidate guidelines for surgical management of PV endocarditis.

TO PLEX OR NOT TO PLEX: A CASE OF PULMONARY-LIMITED ANTI-GLOMERULAR BASEMENT MEMBRANE (GBM) DISEASE

Jeffrey Lee; Justin A. Edward; Emily Waner. University of Colorado, Aurora, CO. (Control ID #3162616)

LEARNING OBJECTIVE #1: Recognize that although extremely rare, pulmonary-limited anti-GBM disease can occur in isolation.

LEARNING OBJECTIVE #2: Identify expert recommended treatment for pulmonary-limited anti-GBM disease.

CASE: A 58-year-old male with a 35-pack-year smoking history and occupational hydrocarbon exposure presented with a 3-day history of submassive hemoptysis and new onset dyspnea. Physical exam was notable for tachycardia, hypoxemia to 72% on room air, and end-expiratory wheezing bilaterally. Workup was significant for a white blood cell count of $12.1 \times 10^9/L$, negative procalcitonin, normal urinalysis, normal creatinine, and chest x-ray with bilateral hazy opacities. CT angiography was negative for pulmonary embolus and demonstrated extensive bilateral patchy ground-glass opacities. Bronchoalveolar lavage diagnosed diffuse alveolar hemorrhage (DAH) with

increasingly hemorrhagic effluent seen on sequential sampling. Bacterial, viral, and fungal cultures were all negative and empiric antibiotics were stopped. Serologic testing resulted in mildly positive anti-GBM antibodies 28 EU/mL (normal <20 EU/mL) with other autoimmune serologies resulting as negative. The patient improved after a 3-day course of pulse-dose steroids and was started on plasmapheresis (PLEX) for 2 weeks. He was additionally started on induction therapy with oral cyclophosphamide and a prolonged prednisone taper with close pulmonology and rheumatology follow-up.

IMPACT/DISCUSSION: Pulmonary-limited anti-GBM disease is extremely rare and only known via case reports. In reported cases, there is a high prevalence of active smoking and exposure to inhaled agents.² The proposed mechanism of pathogenesis is that inhaled agents damage the non-fenestrated pulmonary capillary endothelium allowing anti-GBM antibodies to reach the alveolar basement membrane.^{1,2} Patients who present with DAH without clinical renal involvement should be screened for anti-GBM disease and treatment should be initiated as soon as possible. Early recognition and treatment of pulmonary-limited anti-GBM disease with immunosuppression and PLEX can prevent progression to renal involvement.^{2,3} Due to the limited cases of pulmonary-limited anti-GBM disease, treatment is based on extrapolation of existing recommendations for pulmonary-renal anti-GBM disease. Historically, there has been an association between anti-GBM antibody titer and disease severity.^{3,4} PLEX is used to expedite the clearance of anti-GBM antibodies, and has been shown to control pulmonary hemorrhage, the leading cause of early death in anti-GBM disease.^{3,4} The combination of PLEX and immunosuppression has improved outcomes as compared to immunosuppression alone.^{2,3} PLEX is a relatively safe procedure with a low risk of serious complications.^{3,5}

CONCLUSION: Due to its efficacy and safety, PLEX is recommended in patients with pulmonary-limited anti-GBM disease to rapidly control pulmonary hemorrhage and preserve renal function.

TO SNF OR NOT TO SNF? CHALLENGES IN DISCHARGE PLANNING FOR PATIENTS WITH A HISTORY OF IVDU REQUIRING LONG COURSES OF ANTIBIOTICS

Angela O. Suen¹; Tanya Nikiforova². ¹UPMC, Pittsburgh, PA; ²University Of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #3175932)

LEARNING OBJECTIVE #1: Identify current evidence to support conservative versus liberal antibiotic management for patients with IVDU history.

LEARNING OBJECTIVE #2: Name risk factors that can predict failure of IV antibiotic therapy in the home setting.

CASE: A 30-year-old woman with a remote history of intravenous drug use (IVDU) presented to the hospital with progressive lower back pain. On admission, she was afebrile and hemodynamically stable. Lab work showed no leukocytosis, CRP 2.0, and ESR 89. Blood cultures grew no bacteria. A basic urine drug screen showed no illicit drugs. Spinal MRI showed T10-11 osteomyelitis. Bone biopsy was negative for bacterial growth. Infectious diseases consultants recommended 6 weeks of IV ampicillin-sulbactam. Given her IVDU history, doctors felt the patient would be at high risk for antibiotic failure and line tampering. Discharge to a skilled nursing facility (SNF) was planned but patient refused, citing barriers around child-care and financial difficulties. Patient decided to leave AMA and take oral antibiotics. She was given a prescription at discharge for oral moxifloxacin 400mg to complete a 6-week course. She was lost to follow-up.

IMPACT/DISCUSSION: Given concerns for line tampering, recurring drug use, and antibiotic nonadherence, physicians are often wary of discharging patients with a history of substance use to home to complete IV antibiotics. However, there is no conclusive evidence to support this practice. Current

evidence show low rates of line tampering and high antibiotic completion rates when patients with IVDU history are treated with IV antibiotics at home or at an infusion center. One study found that discharge to home for infusion therapy did not lead to higher rates of line infections, IV drug use recurrence, loss to follow-up, readmission or death when compared to discharge to a skilled nursing facility. However, there are certain patient risk factors associated with a higher failure rate, including active IVDU, unstable housing status, patient unwillingness to comply with therapy, and lack of support systems. Given the absence of conclusive evidence to support our current practice, it is important to consider the patient's risk factors and needs when planning for discharge. This patient was at low-risk for failing home antibiotic therapy; her remote drug use, supportive family, and stable housing are all protective factors. In the future, patients with IVDU history should receive an individualized treatment course that involve a multi-disciplinary team which includes behavioral health, infectious disease, nursing care, and social work.

CONCLUSION: Not all patients with IVDU history necessitate hospital or SNF administration of IV antibiotics. In low risk patients, discharge to home may not lead to higher rates of complications than discharge to SNF. Certain patient risk factors are associated with a higher antibiotic failure rate, including active IVDU, unstable housing, unwillingness to comply with therapy, and lack of support systems.

TRANSIENT ANTI-NMDA RECEPTOR ENCEPHALITIS

Neil Evans; Amitabh Singh; Cory Cheatham. Saint Louis University, Saint Louis, MO. (Control ID #3185911)

LEARNING OBJECTIVE #1: Recognize Anti-NMDA-receptor encephalitis as a frequent cause of encephalitis in young woman

LEARNING OBJECTIVE #2: Associate ovarian teratomas with Anti-NMDA-receptor encephalitis

CASE: A 23 year old female with an unremarkable past medical history presents with psychosis. She was recently discharged from a local psychiatric facility for unresolved "Flakka" intoxication. On presentation she was encephalopathic, aggressive, and inappropriate to staff. Initial workup including EEG was unrevealing. MRI of the brain was negative for malignancies and other abnormalities. LP was performed but was negative for common bacterial and viral infectious causes. CT of the abdomen and pelvis was performed demonstrating a right sided ovarian cyst. Pelvic MRI was performed to better characterize the cyst and it had characteristics consistent with a teratoma. A repeat LP demonstrated an elevated oligoclonal bands and 1:20 Anti-NMDA antibody titre. A presumptive diagnosis of NMDA-R encephalitis was made. She was treated with plasmapheresis, IV immunoglobulin and IV solumedrol. She underwent oophorectomy; four days afterwards, she began showing signs of improvement in her cognition and by two weeks afterwards, the patient had returned to her baseline mental status and was discharged home.

IMPACT/DISCUSSION: Anti-NMDA-receptor encephalitis is the leading reversible cause of encephalitis in females under the age of 30. MRI is not sensitive for this condition with 50% appearing normal. Diagnosis is made by lumbar puncture looking for the antibody. The majority of cases of Anti-NMDA-receptor encephalitis have an identifiable ovarian teratoma, which are thought to contribute to the immune-mediated pathogenesis. Treatment protocols emphasize supportive care and teratoma removal. The treatment regimen for anti-NMDA-receptor encephalitis includes high dose IV glucocorticoids, intravenous immune globulin and plasma exchange. In our case the patient received appropriate therapy and had an identifiable teratoma which was excised; leading to her positive outcome.

CONCLUSION: Autoimmune phenomena in the brain are rare and often a diagnostic challenge. It is important to consider anti-NMDA-receptor

encephalitis in the evaluation of young females with unknown encephalitis. Exploration of teratomas with ultrasound, CT, or MRI is essential to the treatment as removal improves prognosis.

TRANSIENT TRANSAMINITIS AND HEPATIC GLYCOGENOSIS: A RARE COMPLICATION IN TYPE 2 DIABETES

Daniel Yee¹; Jack P. Fatica¹; Bradley Collins². ¹Brown University, Providence, RI; ²Miriam Hospital, Providence, RI. (Control ID #3186263)

LEARNING OBJECTIVE #1: To alert clinicians to a potential cause of transaminitis in poorly controlled diabetics who are given high doses of insulin.

CASE: A 33 year-old woman with poorly-controlled type 2 diabetes mellitus (T2DM), left foot osteomyelitis on broad-spectrum antibiotics, hepatic steatosis, and opiate use disorder on methadone was admitted following elopement from a nearby hospital. On admission she was afebrile and hemodynamically stable with labs notable for AST of 67, ALT of 96, glucose of 308, and no leukocytosis. MRI demonstrated osteomyelitis of the 1st metatarsal head of the left foot, and she was treated with antibiotics and underwent amputation without perioperative complications. Postoperatively, her home insulin regimen was resumed, and she developed fever, abdominal pain, nausea/vomiting, and headache. Labs on post-op day 2 showed AST of 1020, ALT of 299, ALP of 344, GGT of 1097, and LDH >3600. Differential diagnoses included viral or autoimmune hepatitis, hemochromatosis, immune-mediated cholestatic disease, and drug-induced liver injury. RUQ ultrasound was suggestive of hepatic steatosis. A viral hepatitis panel was negative while EBV and CMV IgG studies were both positive, with positive EBV PCR studies. Ferritin was significantly elevated to >16500, but transferrin saturation was 13%, and ceruloplasmin and hereditary hemochromatosis DNA PCR were negative. Antimitochondrial, anti-smooth muscle, and microsomal antibodies were negative. A toxicology screen was appropriately positive for methadone. There was concern for hemophagocytic lymphocytosis with elevated ferritin and IL-2 elevated to 2838, although the patient declined bone marrow biopsy. Over the following days, she had spontaneous resolution of fevers and abdominal pain with return of transaminases to baseline. Liver biopsy showed glycogenosis of the liver parenchyma and mixed inflammatory infiltrates. In-situ hybridization for EBV RNA was negative.

IMPACT/DISCUSSION: This case illustrates a rare complication of diabetes resulting in transaminitis: hepatic glycogenosis, or hepatic glycogenopathy (HG). HG is more commonly associated with type 1 diabetes, and almost never observed in T2DM (a literature search yielded 3 total case reports). The pathology is thought to be due to fluctuating glucose and insulin levels in poorly controlled diabetics, promoting liver glycogen deposition and inflammation. Clinically, patients present with transaminitis that resolves with improved glycemic control. Definitive diagnosis is via biopsy, as imaging of HG is indistinguishable from non-alcoholic fatty liver disease. In our case, transaminitis was worsened with initial insulin management and likely super-imposed drug injury. This is consistent with Tsujimoto et al., who suggest that large insulin boluses may initially worsen transaminitis in those who do not regularly take insulin.

CONCLUSION: In patients with T2DM and fluctuating transaminases, HG should be considered as a potential etiology, with liver biopsy for definitive diagnosis.

TRAUMATIC INJURY IN AN ELDERLY WOMAN: BIASES AND MISSED OPPORTUNITIES

Khameer Kidia^{1, 2}; Amy Ship². ¹Brigham & Women's Hospital, Boston, MA; ²Atrius Health, Boston, MA. (Control ID #3185140)

LEARNING OBJECTIVE #1: Recognize social determinants of health and cognitive bias in clinical assessment

LEARNING OBJECTIVE #2: Recognize frailty as a risk factor for complications in the elderly

CASE: An 88 F fell on the bus, injuring her side and back. She had shoulder, thoracic, and abdominal pain, but didn't seek care until 5 weeks later when CXR and rib x-rays were negative. 1 week later, she was seen urgently for pain worse with inspiration. Exam was non-focal. She was sent to pain clinic where she got depomedrol in T8-10 intercostals. Labs later showed: AST 683, ALT 691, Alk Phos 227. The next day, she again walked to the office. She had a homemade cardboard clock to remember her APAP dosing: 1000mg q 8. She reported living alone and being independent, but that climbing to her 4th-floor walk-up was hard. She had severe pain between her shoulders and in the RUQ, especially with inspiration. Vital signs were normal. She was disheveled and had RUQ tenderness with +Murphy's sign. She was sent to the ED where APAP level = 0, ALT 1586, AST 1298, Alk phos 242, INR 1.2. RUQ US was normal. Work-up showed +Hep A IgM. It was elicited that due to her fixed income she often ate spoiled food from a dumpster. In her 10-day hospitalization, transaminases rose to the 4000s, her INR peaked at 1.4, and she had severe hyponatremia.

IMPACT/DISCUSSION: This case highlights the need to: think about structural reasons for illness, examine biases, and listen carefully. We anchored on the patient's MSK injury and didn't consider structural causes for illness: housing, food, or income. A helpful framework is the structural differential, which "delineates the social, political, and economic factors that may be influencing a patient's health and health care and facilitates responses to the modifiable factors" (Seymour, Griffin et al. 2018). She also lived alone with no social supports. Our rising epidemic of loneliness is increasingly viewed as a health issue, especially in the elderly (Holmen and Furukawa 2002). Addressing loneliness is complex and warrants collective attention. Physicians are not neutral. There were several biases in her care: she was a retired nurse so we assumed high health literacy and financial stability. Her career and diligent cardboard clock, meant we did not formally assess her cognition. There were further clues: she was disheveled. Her constant reassurance about her independence may have been a cry for help. Why did she fall on the bus and sustain such severe injury or mention the stairs to her apartment? This should have clued us into her frailty, which is intimately tied to health outcomes in the elderly (Woo, Goggins et al. 2005).

CONCLUSION: Physician writer Victoria Sweet calls for slowing down the clinical process (2017). This gives doctors time to contextualize a patient and to be systematic. Our case shows the need to look beyond tests. We need to listen to the history and lookout for unspoken signs of distress. We need to slow down.

TREATMENT OF ACQUIRED FACTOR VIII INHIBITOR IN THE SETTING OF BULLOUS PEMPHIGOID

Meredith Ventura¹; Bernard Danna¹; Sara Taveras Alam^{1, 1}; Perumal Thiagarajan^{1, 1}; Gustavo Rivero^{1, 1}; Sarvari Yellapragada^{2, 1}; Madhuri Vasudevan^{1, 1}. ¹Baylor College of Medicine, Houston, TX; ²Michael E Debakey VA Medical Center and Dan L Duncan Cancer Center, Baylor College of Medicine, Houston, TX. (Control ID #3175632)

LEARNING OBJECTIVE #1: Recognize and diagnose acquired hemophilia.

LEARNING OBJECTIVE #2: Treat acquired hemophilia in the setting of bullous pemphigoid.

CASE: A 68-year-old man with bullous pemphigoid (BP) presented to the hospital for ongoing skin blistering and ulceration. Although prednisone was

initiated 2 months ago, he continued to develop active lesions. After admission he developed oozing from IV sites and maroon-colored stools. Past medical history included coronary artery disease, hypertension, type II diabetes, and hemorrhoids. No pertinent family or social history. Medications were prednisone and prophylactic lovenox. Physical exam was significant for oozing from IV sites, blood on rectal exam, and blistering and ulceration over the torso, extremities, and oral mucosa but sparing genitals. Labs revealed a prolonged PTT which did not correct with mixing study, low factor VIII activity, and elevated Bethesda titer. Anticardiolipin IgM, anticardiolipin IgG, anti- 2-glycoprotein IgM, and anti- 2-glycoprotein IgG, HIV, hepatitis A, B, and C, and testing for multiple myeloma were negative. Dilute Russell Viper Venom Time ratio was normal. He was diagnosed with acquired hemophilia A (AHA). Prednisone was continued. IVIG and rituximab were started for cotreatment of BP and AHA. He experienced improvement of both skin lesions and bleeding diathesis. Following discharge, he required readmission for staphylococcus epidermidis septic arthritis of the elbow, which was complicated by traumatic tap requiring recombinant Factor VIIa.

IMPACT/DISCUSSION: BP is an autoimmune blistering skin disease driven by autoantibodies against the hemidesmosomes predominantly affecting the elderly. Steroids are first line treatment. IVIG and rituximab benefit patients who fail steroid monotherapy. AHA incidence also increases with age and is associated with an underlying condition in 50% of cases, the largest being autoimmune diseases. Treatment consists of prednisone and sometimes cyclophosphamide. Although the combination is superior to prednisone alone in inhibitor eradication and disease specific survival, there is no improvement in overall survival. Rituximab is a suggested second line therapy. There is mixed evidence to support IVIG. This case illustrates the typical patient population affected by AHA: an older individual with an autoimmune condition. Co-occurrence of BP and AHA have been described in the literature. BP typically presents prior to or simultaneously with AHA. There are no guidelines for cotreatment. This case provides a successful example of cotreatment and summarizes treatment modalities used in other co-occurring cases of AHA and BP including steroid monotherapy, rituximab, cyclophosphamide, and azathioprine.

CONCLUSION: AHA incidence increases with age and is associated with autoimmune conditions. Treatment of AHA typically consist of steroids and cyclophosphamide. When cotreating BP and AHA consider the addition of IVIG and rituximab.

TREATMENT RESISTANT HELICOBACTER PYLORI: AN INFECTION THAT PROVES DIFFICULT TO STOMACH.

Erica Bass. UCSF, San Francisco, CA. (Control ID #3184984)

LEARNING OBJECTIVE #1: Recognize factors that determine successful eradication of Helicobacter pylori infection.

LEARNING OBJECTIVE #2: Manage treatment resistant Helicobacter pylori infection.

CASE: Ms. J is a 41 year-old African American woman with chronic Helicobacter pylori (*H. pylori*) infection refractory to multiple courses of antibiotics who presented to establish care. She was first tested for *H. pylori* in 2016 when she presented with dyspepsia and was found to have a positive serum immunoglobulin G (IgG) level. She was treated with clarithromycin triple therapy. Her stool antigen (Ag) remained positive and she was treated with bismuth quadruple therapy. She underwent upper endoscopy with biopsy and pathology revealed chronic active gastritis and *H. pylori* organisms. Culture was not performed. She received two additional salvage regimens without evidence of eradication. At presentation she endorsed intermittent, mild epigastric pain and reflux following meals. She denied

dysphagia, odynophagia, nausea, vomiting, and weight loss. She was well-appearing and had no abnormal findings on exam. Her only medication was daily famotidine. She reported strict adherence to past antibiotic regimens. She was seen in gastroenterology clinic and another salvage regimen was prescribed however her stool Ag remained positive. She was referred to infectious disease who recommended repeat endoscopy with biopsies for H. pylori culture and susceptibility testing. Her isolate was found to be resistant to macrolides.

IMPACT/DISCUSSION: H. pylori infection is prevalent and has been associated with chronic gastritis, peptic ulcer disease, and gastric malignancy. First line treatment is either clarithromycin triple therapy or bismuth quadruple therapy. Confirmation of eradication should be performed in all cases as one in five patients will experience treatment failure after initial therapy. Factors associated with successful eradication include choice of antibiotic regimen, patient adherence to therapy, and sensitivity of the organism to the medications administered. The initial regimen should be selected based on prior antibiotic exposures and allergies. Unfortunately, few data on resistance rates are available to guide antibiotic selection. Current guidelines recommend culture with antibiotic sensitivity testing after two failed treatment attempts. Ms. J underwent five failed treatment attempts over two years before she underwent more definitive testing. Ms. J may have been spared multiple rounds of antibiotics, numerous office visits, and testing with a better understanding of the guidelines for managing treatment resistant H. pylori.

CONCLUSION: Treatment failure after initial therapy and relatively common and occurs in one out of five patients. Treatment selection, patient adherence to treatment, and medication resistance are key factors that predict successful eradication of H. pylori infection. Management for treatment failure for H. pylori infection is salvage therapy and then culture and susceptibility testing to guide antibiotic selection.

TRICKY TO PINPOINT: AN UNUSUAL CAUSE OF CHEST PAIN IN A YOUNG MAN

Stephen Russell; Patrick Manning; Ricardo Cruz. Boston Medical Center, Boston, MA. (Control ID #3184995)

LEARNING OBJECTIVE #1: Review etiology and diagnosis of Thrombotic Thrombocytopenic Purpura (TTP)

LEARNING OBJECTIVE #2: Recognize and manage cardiac complications of TTP including acute coronary syndromes (ACS)

CASE: A 25 year old male with no past medical history presented with two weeks of progressive dyspnea on exertion and chest pain. The pain was substernal, pressure-like, and improved with rest. He had one day of dark colored urine, abdominal pain and nausea. On exam he was tachycardic, tachypneic, hypertensive, and in moderate distress. Initial labs revealed a platelet count of 13. There was evidence of microangiopathic hemolytic anemia (MAHA) with hemoglobin 7.4, LDH 2388, haptoglobin <8, and bilirubin 3.1. Blood smear showed schistocytes. Provisional diagnosis of TTP was made and he was admitted to the medical intensive care unit for therapeutic plasma exchange (TPE). Cardiac evaluation was pursued. Initial troponin was 1.64, CK 378. An EKG showed sinus tachycardia. An echocardiogram in the emergency department showed inferolateral and anterolateral hypokinesis with mildly reduced ejection fraction (EF). The troponin peaked at 1.8 and a diagnosis of non-ST-elevation MI (NSTEMI) was made. TTP was confirmed with ADAMTS13 level <3% and antibody titer 2.1. He was transfused with packed red blood cells and treated with metoprolol to decrease cardiac demand. Captopril was added for hypertension. The patient stabilized and repeat echocardiogram five days later showed resolution of wall motion abnormalities and an EF of 65%.

IMPACT/DISCUSSION: TTP is an acquired or hereditary hematologic disorder caused by deficiency in ADAMTS13 protease activity leading to platelet aggregation and microvascular thrombi affecting any organ. Patients classically present with MAHA, thrombocytopenia, fever, renal failure, and neurologic findings. Untreated TTP has a high mortality; the therapeutic imperative is urgent plasma exchange. Though cardiac involvement in TTP is considered rare, autopsy series have demonstrated cardiac damage in a significant number of patients. In a single center series myocardial infarction occurred in 21% of cases. While NSTEMI has been reported, detailed understanding of the clinical course and optimal treatment is unknown. Use of traditional therapeutics such as antiplatelets or anticoagulation is limited by profound thrombocytopenia and bleeding risk. The literature on cardiac imaging in TTP is limited. In case series, few patients had cardiac imaging and fewer had repeat testing after TPE. This patient uniquely had both in hospital and post hospitalization echocardiogram. He had relatively rapid improvement of wall motion abnormalities and there was no evidence of cardiac abnormality on outpatient follow up.

CONCLUSION: Initial evaluation of patients with TTP and cardiac symptoms should include cardiac biomarkers, cardiac imaging, and telemetry. Prompt treatment with TPE is the current best practice for managing cardiac complications of TTP

TWO BROKEN HEARTS

lingsheng li. Johns Hopkins Bayview Medical Center, Baltimore, MD. (Control ID #3184687)

LEARNING OBJECTIVE #1: Recognize the impact of widowhood on health outcomes in older adults

CASE: Mr. M was a 71-year-old retired security agent and primary caregiver for his wife of 49 years. His past medical history was notable for severe coronary artery disease, congestive heart failure, and atrial fibrillation. He was admitted to the cardiac progressive care unit with 2 day history of dyspnea, thought to be in setting of acute decompensated heart failure. On hospital day 3, he was found to be hypotensive, bradycardic, and went into pulseless electrical activity arrest. Resuscitation attempts were unsuccessful. Four days after Mr. M's death, his wife Mrs. M was admitted to the same service with nausea, vomiting, and elevated troponin. She also had a significant cardiac history with poorly-controlled type 2 diabetes. She underwent a left heart catheterization that showed moderate to severe 2 vessel disease not amenable to revascularization. Per her request, Mrs. M was discharged on hospital day 2 to attend her husband's funeral. Mrs. M subsequently underwent 4 more hospitalizations due to diabetic ketoacidosis. Her family noted a dramatic decline in her emotional and physical health, complicated by ongoing grief, difficulty performing activities of daily living, and managing her insulin regimen. On her last admission, she was intubated for airway protection and found to have profound acidemia, hyperglycemia, acute renal failure, and shock requiring maximum dose of 2 vasopressors. Her children concluded that she would have wanted to pass peacefully and that Mr. M would have supported this decision. Her care was thus transitioned to Do-Not-Resuscitate, Do-Not-Intubate, comfort measures. Mrs. M died 41 days after her husband's death.

IMPACT/DISCUSSION: Older, widowed patients have a 48% increase in mortality risk in setting of bereavement^{1,2}. This phenomenon has been described as the "widowhood effect"³. After her husband's death, Mrs. M suffered the loss of her biggest social support, life partner, and caregiver. Their story reflects the profound association between widowhood and adverse health outcomes such as depression, cardiovascular disease, hospitalization, and death. 1. Sullivan AR, Fenelon A. Patterns of widowhood mortality. J

Gerontol B Psychol Sci Soc Sci 2014; 69(1): 53-62. 2. Patton KK, Glymour MM. In anticipation of grief: Using insights from social epidemiology to improve quality of care. Circulation 2013; 128:2725-2728. 3. Parkes CM, Benjamin B, Fitzgerald RG. Broken heart: A statistical study of increased mortality among widowers. Br Med J 1969; 1(5646):740-3.

CONCLUSION: - The "widowhood effect" is an universal health phenomenon. - There are many risk factors that may contribute to poor quality of life in older adults after the death of a partner. - Healthcare providers must take on an active role in supporting vulnerable individuals during times of grief.

TWO DAY OLD STEMI? WITH LUPUS ANYTHING IS POSSIBLE

Ammar Hasnie; Usman Hasnie; James Stanford; Agostino Molteni. UMKC, Kansas City, MO. (Control ID #3185736)

LEARNING OBJECTIVE #1: Recognize the varied clinical manifestations of Lupus; more specifically Antiphospholipid Antibody Syndrome

CASE: A 37-year-old female with a past medical history of Hypertension, Ischemic Cardiomyopathy (EF=40-45%), Systemic Lupus Erythematosus, and Antiphospholipid Antibody Syndrome presented to the Emergency Department with complaints of pleuritic chest pain that had been persistent for two days duration which radiated down her left arm. Initial laboratory workup noted a normal BMP & CBC. Troponin was noted to be elevated at 0. 25 ng/mL. Lipid profile (LDL=72) was within normal limits as was A1C (5. 3). Initial ECG was concerning for ST-elevation MI in the lateral leads(V2-V4) with no bundle branch block. Chest X-ray was unremarkable, however bedside ECHO noted a depressed ejection fraction of 40% with wall motion abnormality in the distribution of the LAD (left anterior descending). A CT-Angiogram of the chest was performed to rule out aortic dissection. The patient was emergently transferred to the cardiac cath lab for percutaneous coronary intervention with drug-eluting stent placement. Cardiac cath noted a mid-LAD lesion that was 99% occluded. She tolerated the procedure well and was discharged to home on Ticagrelor and Aspirin.

IMPACT/DISCUSSION: Systemic Lupus Erythematosus is notoriously known for being the "great imitator" due to its ability to affect any organ system. Antiphospholipid Antibody syndrome commonly presents in the setting of Lupus and is associated with the formation of vascular thrombosis. In this case, the patient waited two days before receiving medical attention. A large retrospective analysis showed Antiphospholipid Syndrome was responsible for 100,000 of myocardial infarctions (MIs) in the United States annually, or nearly 4% of MIs. Given the patient in this case had no obvious traditional risk factors, a delay in diagnosis and treatment could have been fatal given her delay in seeking care. A high index of suspicion of life threatening thrombosis is critical in these patients for the potential for favorable outcome.

CONCLUSION: Antiphospholipid Antibody Syndrome is a systemic autoimmune disease characterized by a hypercoagulable state commonly associated with recurrent pregnancy loss. However, there are other common clinical manifestations ranging from neurological involvement to cardiac involvement. Antiphospholipid antibodies have an ability to induce endothelial activation which can ultimately lead to development of accelerated atherosclerosis. We present a case of an otherwise healthy young female presenting with a myocardial infarction secondary her antiphospholipid antibody syndrome due to plaque rupture in her mid-left anterior descending artery.

TWO DROPS

Letisha Ferris; Michael P. Smith. University of Nebraska Medical Center, Omaha, NE. (Control ID #3185746)

LEARNING OBJECTIVE #1: Identify the three disease phases of Eosinophilic Granulomatosis with Polyangiitis (EGPA)

LEARNING OBJECTIVE #2: Understand the complications of EGPA

CASE: A 53 year-old woman presented with bilateral foot drop. She reported one-month history of progressive clumsiness and a weak hand grip. Symptoms began with a painful rash on her feet. She denied fatigue, myalgia, arthralgia, confusion, dizziness, or loss of bowel or bladder function. She denied recent illness or travel. Past medical history included adult-onset allergic sinusitis and asthma refractory to conventional management. Lung imaging with patchy opacities. Multiple sinus surgeries with tissue biopsies noted eosinophilic infiltration. Screening for ANCA twelve years prior was negative. She had no personal or family history of diabetes or neuromuscular diseases. She had never smoked and drank alcohol occasionally. She had weak flexion and extension in her feet and flexion in her wrists. Ankle reflexes were diminished. Sensation to light touch, pinprick, and vibration were diminished in lower extremities. Proprioception was diminished in her great toes. Temperature sense was intact. She exhibited an ataxic gait and was unable to walk on tip-toes or heels. Foot drop was present bilaterally. She had eosinophilia with an absolute count of 14,600/mL and 65 percent predominance, along with elevated CRP and ESR, trace hematuria, and a positive ANA and p-ANCA. EMG revealed axonal asymmetric sensorimotor neuropathy. Hemoglobin A1c and TSH were unremarkable. Infectious work-up was negative, as were vitamin levels, brain and cervical spine MRI, electrocardiogram, and echocardiogram. She actually met diagnostic criteria for EGPA years prior to presentation

IMPACT/DISCUSSION: EGPA (formerly Churg-Strauss) is a vasculitis of small and medium sized vessels characterized by allergic rhinitis, asthma, and peripheral eosinophilia. It occurs in 18 out of every 1,000,000 people and accounts for 10 percent of vasculitis cases. It is associated with p-ANCA in approximately 50 percent of cases but it is not part of the diagnostic criteria. The diagnostic criteria for EGPA require four of the following to be present: paranasal sinus abnormalities, asthma, non-fixed pulmonary opacities on radiography, greater than 10 percent eosinophils, biopsy revealing extravascular eosinophils, and mononeuropathy or polyneuropathy. EGPA classically presents in three sequential phases. Atopy is representative of the prodromal phase. Peripheral eosinophilia and eosinophilic infiltration of organs, most notably the lungs, is characteristic of the eosinophilic phase. The vasculitic phase commonly manifests as neuropathy, most specifically mononeuritis multiplex, but it may give rise to serious extra-pulmonary complications that account for the majority of mortality in EGPA.

CONCLUSION: It is essential that internists are able to recognize EGPA as early as possible in the disease course to prevent the development of the irreversible vasculitic stage and the associated extra-pulmonary complications.

TYPE 1 OR TYPE 2 DIABETES? A YOUNG, ASYMPTOMATIC MALE WITH A NORMAL BMI, FOUND TO HAVE SEVERE TYPE 2 DIABETES WITH END ORGAN DAMAGE

Noah Ravenborg; Allison Diamant. UCLA, Los Angeles, CA. (Control ID #3180727)

LEARNING OBJECTIVE #1: Recognize that the prevalence of Type 2 Diabetes Mellitus is increasing, including among adults younger than 40

LEARNING OBJECTIVE #2: Recognize when to consider screening for antibodies associated with Type 1 Diabetes Mellitus in patients who already have a diabetes diagnosis

CASE: An asymptomatic 32-year-old male who had not seen a physician in more than 2 years presented to an outpatient Internal Medicine practice to establish care. History and physical were significant for his social history,

which revealed a sedentary lifestyle, high consumption of carbohydrates including sugary foods and beverages. His review of systems was negative. Physical exam was notable for an elevated blood pressure of 137/87, BMI of 23, and tinea pedis. Significant Labs: Random glucose 248, Hemoglobin A1C 10.0%, Non-fasting Total cholesterol 282, Triglycerides 1,075, HDL 29 Repeat tests prior to return visit 1 week later: Hemoglobin A1c 9.7%, Random glucose 194, Serum ketones: negative, Fasting Total cholesterol 239, Triglycerides 840, HDL 25, Urinalysis: 1+ glucose, Albumin/creatinine ratio: 69.2, Glutamic Acid Decarboxylase Ab: negative, Insulin Ab: negative, IA-2 Ab: negative, C-peptide: 2.2 He was advised to start metformin, long acting insulin, an ACEi, and a statin.

IMPACT/DISCUSSION: This case helps to highlight two important points: Firstly, the importance of being aware of all risk factors associated with DM, especially sedentary lifestyle and dietary composition. Without this historical component, we may not have screened this patient for DM and would have missed the diagnosis and the opportunity to reduce his risk for further complications. He was asymptomatic, with no family history, and a normal BMI, and yet had severe disease and nephropathy. Of note, current USPSTF and ADA recommendations for screening do not include people in his age category and BMI. We suggest considering screening for diabetes on a broader scale for individuals with significant risk factors, and this case highlights the importance of having a lower threshold to screen. Secondly, when the diagnosis of DM is made in a young adult, when should clinicians consider a further work up for Type 1 Diabetes Mellitus (T1DM)? We want to highlight a screening tool that was developed to identify patients who should receive further screening for antibodies associated with T1DM. This screening tool recommends antibody testing in individuals with at least 2 of the following: age of onset < 50, symptoms of hyperglycemia, BMI < 25, and personal or family history of autoimmune disease.

CONCLUSION: Given the increasing prevalence of diabetes, it is crucial that we screen and diagnose the disease early. Most current guidelines may not be broad enough to diagnose new cases of diabetes, and we should consider having a lower threshold to screen for those at risk.

TYPHOID FEVER IN A NON ENDEMIC URBAN SETTING

Kateryna Fedorov¹; Syed Muhammad Ibrahim Rashid²; Johanna Daily¹.
¹Montefiore Medical Center, Bayside, NY; ²Montefiore Medical Center, Bronx, NY. (Control ID #3182911)

LEARNING OBJECTIVE #1: Microbiology and epidemiology of *Salmonella typhi*

LEARNING OBJECTIVE #2: Signs, symptoms, clinical course, and therapeutic approach to Typhoid fever

CASE: 57-year-old male presented with one week of disabling rigors, fatigue, and myalgias. He denied any sick contacts. No travel outside the United States for himself or his close contacts. His vitals were 130/65mmHg, 79bpm, 102.5F. On exam he had mild abdominal tenderness. WBC was 5.7k/uL. Blood cultures were drawn. CT abdomen and pelvis showed small lymph nodes, likely reactive. He remained well, defervesced after one dose of Tylenol, and was discharged home. Post discharge he experienced worsening malaise, prostration, rigors, fevers, and anorexia. The patient was called to return to the hospital when blood cultures grew *Salmonella typhi*. On admission patient's vitals were 101.3F and 64bpm, consistent with pulse-temperature dissociation. On exam he was ill appearing, diaphoretic, with mild diffuse abdominal tenderness and had relative leukopenia with WBC of 4.5k/uL. Stool cultures grew *S. typhi*. The patient was treated with 3 days of IV Ceftriaxone, followed by 14 days of Cefpodoxime. He reported no recurrent fevers and increasing energy levels one week post-discharge.

IMPACT/DISCUSSION: Typhoid fever is caused by *Salmonella typhi*, a gram negative flagellated bacillus in the family Enterobacteriaceae. There were 26.9 million cases reported worldwide in 2010; 367 cases in the US in 2015, with 82% with history of travel outside US. Remaining 18% includes those without personal history of travel to typhoid endemic areas. In such cases the transmission of typhoid could occur from an infected traveler to a non-traveler. Even asymptomatic carriers and those recovering from Typhoid fever can act as reservoirs of infection. Transmission of *S. typhi* is typically fecal-oral with humans being the only host. Ingested bacteria penetrate small bowel epithelium and disseminate hematogenously or through lymphatics. Typhoid fever syndrome consists of several stages. Initially, patients have rising fever secondary to bacteremia with a pulse-temperature dissociation followed by higher fevers, abdominal pain, and rose spots. Intestinal perforation, peritonitis, and sepsis can occur in week three. Advanced cases may have neurologic involvement include distorted sleep, psychosis, myalgias, and rigidity. Treatment is based on local sensitivity patterns, usually with fluoroquinolones, third-generation cephalosporins, and azithromycin. Our patient presented with signs strongly suggestive of *S. typhi* infection: pulse-temperature dissociation, relative leukopenia, and reactive abdominal lymphadenopathy. His diagnosis was delayed given negative travel history to typhoid endemic regions. Blood cultures allowed early diagnosis and may have prevented progression to life threatening symptoms.

CONCLUSION: Typhoid fever is uncommon in the US, especially in patients without travel history. In such patients blood cultures are essential to establish the diagnosis prior to disease progression.

TYPICAL PYELONEPHRITIS TRIGGERING ATYPICAL HEMOLYTIC UREMIC SYNDROME

Malavika Kapuria; Ahmed Awan; Rajeev Raghavan. Baylor College of Medicine, Houston, TX. (Control ID #3186967)

LEARNING OBJECTIVE #1: Identify urinary tract infections (UTI) as a trigger of complement-mediated hemolytic uremic syndrome (HUS)

LEARNING OBJECTIVE #2: Recognize the challenges related to diagnosing complement-mediated HUS

CASE: A 24-year-old woman with recurrent UTIs and chronic vaginal discharge was admitted for acute pyelonephritis. She had no diarrhea, and urine cultures grew *G. vaginalis*. Days after initial presentation, she developed worsening anemia and thrombocytopenia, requiring multiple transfusions. Labs revealed Coombs negative, microangiopathic hemolytic anemia (MAHA), nephrotic range proteinuria, and low complement (C3, C4) levels, suggesting a thrombotic microangiopathy (TMA). Empiric treatment for thrombotic thrombocytopenic purpura (TTP) was initiated with plasma exchange (PLEX) and high-dose steroids, while awaiting ADAMTS13 levels. Thrombocytopenia improved, however there was persistent hemolysis despite continued PLEX. On eliciting additional history, the patient reported that her grandmother had required PLEX after developing acute pancreatitis, and eventually required kidney transplant for unclear reasons. Kidney biopsy confirmed TMA, and ADAMTS13 level was 100%. Consequently, complement-mediated HUS was diagnosed and Eculizumab was started, after which the hemolysis and renal function improved.

IMPACT/DISCUSSION: Atypical HUS is an umbrella term describing a triad of MAHA, thrombocytopenia and renal failure, in the absence of ADAMTS13 deficiency and Shiga-toxin infection. More recently, it has come to define complement-mediated HUS - a disorder of unregulated complement activation, resulting from the primary deficiency of specific regulatory proteins. Definitive diagnosis involves measuring levels of these deficient proteins; tests which are both hard to obtain and often result too late to defer

management. Clinically, complement-mediated HUS presents with a HUS-like triad that frequently overlaps with, and is occasionally indistinguishable from other TMAs. Furthermore, its association with infection results in its misdiagnosis as a secondary TMA *caused by* an infection, as opposed to a hereditary disorder *unmasked by* the infection. Treating the infectious trigger therefore does not limit the disease process, and missed diagnoses have substantial implications for patient outcomes and family counseling. Our case is particularly interesting as UTIs are seldom reported triggers of complement-mediated HUS; and when associated, the UTIs are almost exclusively due to *E. coli*, and almost never due to *G. vaginalis*.

CONCLUSION: Complement-mediated HUS is a diagnostic challenge due to its nonspecific clinical presentation and limited complement testing. Delays in recognition however can have devastating patient outcomes, including irreversible end-stage kidney failure. Clinicians must therefore maintain a high index of suspicion: consider infectious triggers and family history, and promptly initiate complement-inhibiting Eculizumab to halt hemolysis and potentially reverse kidney injury.

UNCOMMON BUT LIFE-THREATENING: PERSISTENT ENCEPHALOPATHY DUE TO PROLONGED HYPOGLYCEMIA.

Faiza Javed; Charu Ramchandani; Colette Knight. Montefiore Medical center, Wakefield campus, Bronx, NY. (Control ID #3181453)

LEARNING OBJECTIVE #1: Recognize that untreated hypoglycemia can result in prolonged neurological sequelae.

LEARNING OBJECTIVE #2: Assess the role of neuroimaging in diagnosing hypoglycemia-induced encephalopathy

CASE: A 73-year-old woman with type 2 diabetes mellitus and hypertension was brought to the emergency department after being found unresponsive at home. She was last seen in good health 24 hours earlier by her family. Home medications were insulin glargine, repaglinide, and metformin. On examination, vital signs were normal, but glucose finger stick was low at 24mg/dL. Glasgow coma scale score was 3/15, brain stem reflexes were present, and limbs had a flaccid tone with absent reflexes. She was given Dextrose 50% and was started on Dextrose 5% infusion but continued to have hypoglycemic episodes over the next 48 hours. Head CT ruled out stroke or hemorrhage. Brain MRI revealed nonspecific restricted diffusion involving bilateral corona radiata, centrum semiovale, white matter, and splenium of the corpus callosum, concerning for hypoglycemic injury. Infectious etiology and seizures were ruled out. Urine toxicology studies were negative. Hypothyroidism, adrenal insufficiency, and insulin hypersecretion were ruled out. Repeat MRI brain five days after presentation revealed resolution of restricted diffusion in the cerebral white matter; however, the patient did not improve clinically.

IMPACT/DISCUSSION: Severe hypoglycemia can cause encephalopathy. Areas of high energy consumption in the brain, such as cerebral cortex, hippocampus, cerebellum, caudate nucleus, and pallidum, are first to be affected by hypoglycemia. Hypoglycemia causes extensive denaturation, necrosis of neurons, and infiltration of glial cells. Insulin, sulfonylureas, alcohol abuse, renal dysfunction, old age, and infection can all precipitate hypoglycemia. Our patient was taking a combination of insulin, metformin, and repaglinide for many years; infection, drugs, alcohol or renal dysfunction were ruled out. Reversible hypoglycemic encephalopathy has been mentioned in case reports in patients whose hypoglycemic episodes lasted 12-72 hours. In this patient, hypoglycemia was observed for 48 hours after presentation, but it was not known for how long she was hypoglycemic at home. Irreversible, diffuse lesions involving extensive areas of cerebral cortex, hippocampus, and basal ganglia on MRI are associated with worse outcomes. Patients with

reversible lesions on MRI were observed to recover either completely or with lingering deficits, such as aphasia. This patient had reversible, restricted diffusion on MRI, but failed to show any clinical improvement after five months.

CONCLUSION: * Early diagnosis and treatment of hypoglycemia can prevent irreversible encephalopathy. * Resolution of MRI findings due to hypoglycemic brain injury may not always predict recovery from encephalopathy.

UNCONSCIOUS AND UNRESPONSIVE: SYNCOPES OR SOMETHING ELSE?

Jimmy Feeney; Susan Wlodarczyk. UCSF, San Francisco, CA. (Control ID #3180813)

LEARNING OBJECTIVE #1: Differentiate syncope from other causes of transient loss of consciousness (TLOC)

LEARNING OBJECTIVE #2: Identify clinical features that suggest a neurologic cause of TLOC

CASE: A 74 year-old man with a history of eosinophilic granulomatosis with polyangiitis was found slumped over in his chair during a routine rituximab infusion. The patient was unresponsive to sternal rub, did not localize to pain, and had a GCS of 3. His initial vital signs were normal. Labs including glucose, CBC, chemistry panel, Utox, troponin and ABG were unremarkable. ECG showed sinus bradycardia with HR of 52. Non-contrast CT of the head was normal. After 30-minutes, the patient abruptly returned to his normal baseline mental status without intervention and was alert, conversant and had a non-focal neurologic exam. He then had a second episode of TLOC, again with spontaneous return to baseline, and was admitted for further evaluation. Given a negative workup for common causes of syncope, including orthostatics, ECG, and TTE, the differential was expanded to include non-syncopal causes of TLOC. A brain MRI/MRA showed multiple punctate infarcts involving the posterior circulation, including the pons, likely from a cardioembolic source given their distribution. The patient was ultimately diagnosed with a posterior circulation TIA as the cause of his episodes of TLOC

IMPACT/DISCUSSION: Syncope, defined as TLOC from global cerebral hypoperfusion, is the most common cause of TLOC, accounting for 6% of hospitalizations in the US¹. Current evidence and guidelines recommend avoiding unnecessary brain imaging in the routine diagnostic workup of syncope¹. However, this case demonstrates the importance of clinically differentiating true syncope from neurologic causes and recognizing when a broader diagnostic workup is indicated. The hypercoagulability that occurs in eGPA increased this patient's likelihood of having a neurovascular cause of TLOC². Further, the key feature distinguishing this case from true syncope was the prolonged nature of his TLOC with normal vital signs, which is more characteristic of coma. In contrast, syncope is typically brief, self-limited and with rapid recovery. Sudden onset of coma suggests a vascular origin, such as a brainstem stroke involving the reticular activating system. While rare, lesions to the pons are known to cause TLOC and coma. This patient's brain MRI revealed multiple posterior circulation infarcts suggesting that he most likely had a transient basilar artery occlusion. While vertebrobasilar TIA is a rare cause of TLOC, it is crucial that internists recognize when a patient's presentation may point to a neurologic cause that requires a different diagnostic approach compared to true syncope. 1.Mendu 2009, PMID 19636031 2.Aviña 2016, PMID 27213713

CONCLUSION: Clinical features such prolonged duration and complete unresponsiveness distinguish true syncope from neurologic causes of TLOC. Vertebrobasilar TIA that causes ischemia in the brainstem, especially the pons, is a rare but important cause of TLOC

UNCONTROLLED CELL GROWTH: A CASE REPORT OF ACUTE MYELOID LEUKEMIA IN A PATIENT WITH NEUROFIBROMATOSIS TYPE-1

Saboor E. Randhawa¹; Nagendra Natarajan²; Jonathan Gootee¹; Mohsin Mirza¹. ¹Creighton University, Omaha, NE; ²Nebraska Cancer Specialists, Omaha, NE. (Control ID #3186272)

LEARNING OBJECTIVE #1: Recognize the association of Neurofibromatosis type-1 with Acute Myeloid Leukemia.

LEARNING OBJECTIVE #2: Recognize the association of Neurofibromatosis type-1 with benign and malignant tumors based on cytogenetics.

CASE: A 67-year-old male presented with severe worsening dyspnea, weakness and unexplained weight loss. His past history was significant for Neurofibromatosis type-1 (NF-1), diabetes mellitus, Barrett's esophagus, and multiple benign lung nodules. He denied fever, chills, night sweats, chest pain or easy bruising. Physical exam was remarkable for numerous raised nodules on his back, arms and face characteristic of NF-1. An extensive diagnostic workup was undertaken. Complete blood count analysis showed hemoglobin of 6.0 g/dL, platelet count of 29,000/microL, white blood cell count of 42,400/microL with frequent blasts in the peripheral blood. Bone marrow biopsy and aspiration diagnosed acute monoblastic leukemia (a type of Acute Myeloid Leukemia or AML) based on morphology and immunophenotyping. Myeloid mutation panel testing showed alteration in NPM1, TET2, DNMT3A, U2AF1, and cytogenetics/Fluorescent-In-Situ-Hybridization confirmed trisomy 8. This profile is associated with poor prognosis. He was initiated on intensive remission induction therapy with standard dose cytarabine and idarubicin (7+3 chemotherapy) along with aggressive supportive measures. Remission was achieved, and bone marrow biopsy and aspiration completed on day 14 of treatment revealed hypocellular marrow without evidence of residual AML. His blood counts recovered, with improvement in symptoms.

IMPACT/DISCUSSION: Neurofibromatosis type-1 (NF-1), or Von Recklinghausen disease, is an autosomal dominant genetic disorder with an incidence of approximately 1 in 3000 individuals. NF-1 is due to mutations in the NF1 gene, located at chromosome 17q11.2. These mutations can lead to a number of benign and malignant tumors. The association between hematologic malignancies and germ-line mutations of NF1 has been established in the pediatric setting. In adult population, though not as strong, the association between both leukemia and lymphoma has been described. Germline heterozygous alterations of NF1 gene lead to a higher risk to develop juvenile myelomonocytic leukemia and/or AML. More recently, somatic 17q11 deletions encompassing NF1 have been described in many adult myeloid malignancies. In our case, the presence of a malignancy of myeloid lineage supported the association of AML with NF-1, however further studies are needed to establish a direct connection.

CONCLUSION: - Neurofibromatosis type-1 is associated with hematological malignancies like Acute Myeloid Leukemia. - Uncontrolled cell growth due to mutations in NF-1 gene results in both benign and malignant tumors.

UNDER PRESSURE - COMMUNICABLE OR IATROGENIC CARDIOMYOPATHY?

Max Zlatopolsky^{1, 2}; Vadim Gladwill¹; Mathar Aldaoud^{2, 1}; Mahmoud Assaad². ¹Ascension-Providence, St. Clair Shores, MI; ²Ascension-Providence Heart Institute, Southfield, MI. (Control ID #3180731)

LEARNING OBJECTIVE #1: Recognize the complexity of stress cardiomyopathy and its major subtypes beyond that of the typical apical (Takotsubo) variant

LEARNING OBJECTIVE #2: Better understand the more common risk factors for stress cardiomyopathy

CASE: A 65 year old African-American male presented to a tertiary care emergency department with dyspnea and serially positive troponins (0.21, 0.24). His past medical history was significant for COPD, hypertension, and tobacco dependence. He had no prior history of acute coronary syndrome (ACS) or relevant family history. Physical examination was essentially unremarkable, however the patient was hypoxic saturating 98% on 2L of oxygen on nasal cannula. Laboratory studies were unrevealing with the exception of the aforementioned elevation in troponin levels. EKG demonstrated normal sinus rhythm without injury pattern. Echocardiography revealed regional hypokinesis of the left ventricular anterior/antrolateral wall with sparing of the apex, along with hypokinesis of the mid/apical right ventricular wall - suspicious for bi-ventricular stress cardiomyopathy. A left heart catheterization was performed to evaluate for obstructive plaques and possible stress cardiomyopathy. Non-obstructive CAD was discovered with <50% stenosis in the left coronary, right coronary, and left circumflex arteries. Ventriculography confirmed a midventricular stress cardiomyopathy. The patient was initiated on a b-blocker and encouraged to refrain from using his albuterol inhaler and to avoid physical or emotional exertion. Interestingly, further discussion with the patient revealed that his wife experienced stress cardiomyopathy 2 months prior to his presentation. The patient also revealed that due to his dyspnea, he began using his rescue inhaler more frequently (up to 15 times per day) prior to his hospitalization.

IMPACT/DISCUSSION: We believe our case highlights the importance of forming a broad differential in the setting of positive troponins and an anginal equivalent in a patient with risk factors for ACS. It also draws our readers' attention to the complexity of stress cardiomyopathy, and explains that not all stress cardiomyopathy is Takotsubo cardiomyopathy. The current preclinical theory based on animal studies presupposes that the apex contains a higher proportion of adrenergic receptors explaining its ability to be preferentially effected in an a severely stressful situation. And of course, we want to emphasize that COPD is a common but underreported etiology for stress cardiomyopathy that impacts males. Prospective registries identify 90% of stress cardiomyopathy among women, and the biventricular variant is extremely rare which adds an additional layer of nuance to our case.

CONCLUSION: - Men can develop stress cardiomyopathy despite the overwhelming female predilection - There are multiple variants of stress cardiomyopathy - COPD is a known risk factor for the development of stress cardiomyopathy - Biventricular cardiomyopathy can occur in the absence of cardiogenic shock

UNEXPECTED ASCITES: AN UNCOMMON PRESENTATION FROM COEXISTING COMMON CONDITIONS.

Shirin Karimi¹; Ariel Majidi¹; Priyank Jain². ¹Cambridge Health Alliance, Harvard Medical School, Boston, MA; ²Cambridge Health Alliance, Cambridge, MA. (Control ID #3186312)

LEARNING OBJECTIVE #1: Recognize an uncommon cause of inflammatory ascites

LEARNING OBJECTIVE #2: Recognize that coexisting common conditions can produce unusual presentations

CASE: A 58 year old man with alcohol use disorder was admitted after being found intoxicated with Listerine. He reported acute onset epigastric pain radiating to the back with progressive difficulty initiating urination and incomplete voiding. His physical exam revealed a markedly distended abdomen with diffuse abdominal tenderness. Basic chemistry showed K 7.0, Anion Gap 29, Cr 7.3, NT-proBNP 789, Lactic Acid 9.5. Additional labs

showed Lipase 2086, AST 87, ALT 71. Total bilirubin, Alkaline Phosphatase and INR were normal. WBC 23,000 and Platelets 196,000. CT of abdomen and pelvis showed hepatic steatosis, large volume ascites, and distended urinary bladder. A Foley catheter immediately drained 1.5 L clear urine. He was treated for pancreatitis and bladder outlet obstruction with resolution of symptoms and normalization of CBC, BMP and lactate within 2 days. Diagnostic paracentesis revealed 2005 nucleated cells in the peritoneal fluid. He was started on ceftazidime for possible bacterial peritonitis; this was discontinued when bacterial and blood cultures were negative after 48 hours of incubation. Cytology was negative for malignant cells. CT of the abdomen and pelvis with contrast was repeated when pancreatitis and bladder obstruction had resolved. This showed almost complete resolution of ascites and bladder outlet obstruction. The cause of his ascites was attributed to hypervolemia from obstructive renal failure and concurrent inflammation from acute pancreatitis.

IMPACT/DISCUSSION: To our knowledge, this is the first presentation of inflammatory ascites secondary to acute renal failure and acute pancreatitis in the medical literature. While other causes of ascites are more commonly seen as those causes observed in hypervolemia (cirrhosis, congestive heart failure, end-stage renal disease), or inflammation (malignancy or chylous ascites seen in chronic pancreatitis), our literature review did not find any recorded cases of ascites attributed to acute renal failure with concomitant acute pancreatitis. This case educated the team that patients can manifest unusual presentation when different disease states coexist that can have a synergistic pathophysiological derangement. Neither acute pancreatitis nor acute urinary obstruction causes ascites individually, but in our case, these conditions coexisted and presented with ascites because of hypervolemia and inflammation. In unclear cases of new large volume ascites, one must proceed with thorough investigation through diagnostic paracentesis and CT abdomen/pelvis. However, with concomitant acute renal failure and acute pancreatitis, one can expect significant resolution in ascites with resolution of renal failure and supportive treatment of acute pancreatitis.

CONCLUSION: A new large volume ascites can be observed in cases of acute urinary obstruction renal failure and/or acute pancreatitis.

UNICENTRIC CASTLEMAN DISEASE IN THE SETTING OF HODGKIN LYMPHOMA

Nishant Munugala; Andrew Rettew. University of Arizona, Banner University Medical Center, Tucson, AZ. (Control ID #3186358)

LEARNING OBJECTIVE #1: Evaluate lymphadenopathy in an asymptomatic patient

LEARNING OBJECTIVE #2: Diagnose Castleman Disease and assess underlying etiology

CASE: A 70-year-old obese male with no significant medical history presented to his primary care provider with progressive, painless left-sided neck swelling of several years duration. Evaluation with computed tomography of the neck revealed a 3-cm lymph node concerning for a neoplastic process. He underwent an excisional biopsy with pathologic findings of angiofollicular lymph node hyperplasia, consistent with Castleman disease of the hyaline vascular subtype. Subsequent PET/CT revealed residual disease confined to the left neck, confirming unicentric disease. Further workup for potential etiologies of Castleman disease was undertaken, including evaluation for HIV, HHV-8, and paraproteinemia, which were all unrevealing. Given the asymptomatic nature of the disease, it was decided to opt for close clinical observation as opposed to additional surgery or systemic therapy. Follow-up PET/CT 6 months later was largely unchanged from prior, continuing to show FDG-avid lymph nodes in the anterior and posterior cervical chains. Given the

lack of any significant clinical or radiographic changes, continued observation was pursued. Approximately 1-year later the patient presented for follow-up and noted increased neck swelling in addition to a 35-pound weight loss in the preceding 5 months. Repeat PET/CT revealed increased size and number of FDG-avid lymph nodes in the neck. ENT performed a left neck dissection in an effort to remove all known disease and provide a cure. Pathologic review revealed hyaline vascular Castleman disease intermixed with nodular sclerosing Hodgkin lymphoma. The initial pathology specimen was reviewed, which, in retrospect, did reveal CD30 positive Reed Sternberg cells within the hyaline vascular Castleman disease. Treatment for classical Hodgkin disease was recommended for the patient despite negative post-operative PET/CT given systemic nature of Hodgkin lymphoma.

IMPACT/DISCUSSION: Unicentric Castleman disease is a rare clinical entity, with approximately 2,500 cases diagnosed per year in the United States, that often presents as asymptomatic lymphadenopathy. Pathologic evaluation is of critical importance in diagnosis and thus an excisional biopsy should be pursued. Histologic evaluation reveals one of four subtypes: hyaline vascular, plasma cell, mixed, and plasmablastic. Following diagnosis, workup for an underlying etiology is critical, as Castleman disease is often associated with an underlying disease process, as highlighted by our case. The occurrence of Hodgkin lymphoma concurrently with Castleman disease is exceedingly rare, with few documented cases in the literature.

CONCLUSION: Developing a systematic approach to lymphadenopathy is an essential skill for internists. Castleman Disease requires adequate evaluation for an underlying etiology to optimize therapy

UNUSUAL ETIOLOGY OF A USUAL DIAGNOSIS; A CASE OF NON CONVULSIVE STATUS EPILEPTICUS

Muhammad Hammad; Akhilesh Kumar Thakur; Umair Bajwa. Presence Saint Francis Hospital, Evanston, IL. (Control ID #3186351)

LEARNING OBJECTIVE #1: Consider Non-Convulsive Status Epilepticus and Creutzfeldt Jakob Disease as unusual causes of Encephalopathy

LEARNING OBJECTIVE #2: Recognize the importance of continuous EEG monitoring to diagnose Non-Convulsive Status Epilepticus

CASE: A 68-year-old male presented with altered mental status and an episode of generalized seizure. He had also been more lethargic for the last few months, acting bizarrely and forgetting things. At presentation, he was vitally stable but appeared drowsy. Initial lab work was negative for leukocytosis and electrolyte abnormalities. CXR was concerning for left lower lobe infiltrate. Seizure and encephalopathy was thought to be secondary to underlying infection. CT angiogram of head and neck showed old lacunar infarcts but negative for acute pathology. Spot EEG revealed encephalopathy without any epileptiform activity. MRI brain showed signal alteration on diffusion, ADC, Flair and T2-weighted sequences within the bifrontal and biparietal regions which suggested encephalitis or status epilepticus rather than acute ischemia. CSF analysis was negative for infectious etiology but later came back positive for 14-3-3. Rapidly worsening mental status without seizure like activity raised suspicion for Creutzfeldt Jakob Disease. However, late into the course of his hospital stay, a witnessed seizure raised suspicion for status epilepticus. Continuous EEG monitoring revealed electrographic status epilepticus with sub clinical seizures occurring almost every three minutes. He was treated with anti-epileptics with improvement in his mental status.

IMPACT/DISCUSSION: Encephalopathy in adult population is commonly encountered in clinical practice with underlying cause sometimes difficult to determine. Non-convulsive status epilepticus remains under recognized because the patients do not usually show classical ictal features. This case underscores the importance of continuous EEG monitoring to diagnose

NCSE as the cause of encephalopathy especially when the etiology remains unclear since the treatment can lead to improved outcomes.

CONCLUSION: Nearly one-half of new-onset seizures occur in individuals over the age of 65 years. Status epilepticus is also not infrequent in older patients. Non convulsive status epilepticus remains a challenging diagnosis as the seizures in older patients are less likely to be convulsive. NCSE can sometimes occur after a single brief convulsive seizure leading to prolonged confusional state that is sometimes mistakenly thought to be postictal. Continuous EEG is therefore needed to make the diagnosis and should be obtained for any patient with altered consciousness of unknown etiology. Detection of 14-3-3 protein in CSF should be considered as an adjunctive rather than absolute test for the diagnosis of prion diseases. The specificity of the test is around 80 percent and can be positive in non-prion diseases as well obscuring the diagnosis. It remains critical to make the right diagnosis. Whereas NCSE is treatable, CJD remains without cure.

UNUSUAL PRESENTATION OF CMV COLITIS IN AN ELDERLY IMMUNOCOMPETENT PATIENT

Xixi Xu; Muhammad Fazal; Susan Phillips. Boston University School of Medicine, Boston, MA. (Control ID #3186043)

LEARNING OBJECTIVE #1: Recognize that CMV colitis should be considered in the differential diagnosis of severe colitis in older immunocompetent patients.

CASE: A 72-year-old male from Cape Verde with an unknown past medical history presented with 2 months of profuse, non-bloody, watery diarrhea that was not responsive to antibiotics. On admission, the patient had diarrhea that occurred up to 8 times per day with poor appetite, no abdominal pain, nausea or vomiting. Physical examination revealed normal abdominal exam. Laboratory studies were pertinent for WBC 10.2K/UL, potassium of 2.8 mmol/L and magnesium of 1.1 mg/dL. Inflammatory markers were elevated with CRP of 47.7 mg/L and ESR of 43 mm/Hr. Stool culture, stool ova and parasite exam, stool PCR for bacteria, parasite and Microsporidia were negative. Serology testings were negative for HIV and HTLV but positive for IgG of Cytomegalovirus (CMV). Serological viral DNA load was at 9443 IU/ml. A CT of the abdomen and pelvis showed evidence of pancolitis with dilated transverse colon. Colonoscopy showed severe inflammation in the colon with large well-demarcated patches and the edges were heaped. Biopsy showed diffuse ulceration, granulation tissue, and reparative changes. Immunohistochemistry of the biopsy was positive for CMV. Treatment with ganciclovir was started for 6 days and was transitioned to valganciclovir. The patient was discharged with valganciclovir and loperamide. Four weeks after the initiation of antiviral treatment, he reported significant improvements in symptoms. Repeated Flexible Sigmoidoscopy showed marginal improvements in the colon. Biopsies showed no CMV on immunohistochemistry but the rest of the histological findings were similar to prior biopsies.

IMPACT/DISCUSSION: Gastrointestinal involvement of CMV is usually seen in immunosuppressed patients with common presentations including diarrhea, fever, and abdominal pain. CMV colitis can mimic colitis caused by *C. difficile*, ischemia, malignant diseases, and inflammatory bowel diseases both clinically and radiologically. Thus, a diagnosis of CMV colitis requires positive IgM titer for CMV, CMV antigen in the blood, positive PCR in blood or urine, and positive immunohistochemistry/histological findings. CMV colitis in immunocompetent hosts is rare. Only 28 cases are reported in a meta-analysis. Most of these patients are over 55 years old, which suggests that the immune system weakens as a consequence of aging and high prevalence of comorbidities. Young and otherwise healthy patients usually do not need antiviral therapy and can recover spontaneously. For older patients

with comorbidities, antiviral therapy such as gancyclovir or foscarnet is necessary.

CONCLUSION: After exclusion of common etiologies for severe diarrhea in older patients, CMV colitis should be considered in the immunocompetent patients. Diagnosis of CMV colitis is made with positive serological and histological findings. Gancyclovir or foscarnet should be initiated in older patients once diagnosed.

UTILITY OF FOUR-DIMENSIONAL CORONARY COMPUTED TOMOGRAPHY ANGIOGRAPHY FOR MOBILITY OF A THROMBUS IN THE ASCENDING AORTA

Toshiki Kuno¹; Daisuke Asahara²; Kiyoshi Koizumi²; Takahito Ito²; Yohei Numasawa²; Masaki Kodaira²; Kazuo Isozumi²; Satoru Komatsu².

¹Mount Sinai Beth Israel, New York, NY; ²Japanese Red Cross Ashikaga Hospital, Ashikaga, Japan. (Control ID #3186408)

LEARNING OBJECTIVE #1: 4DCCTA is an excellent alternative without blind spots to detect and evaluate the mobile thrombus in the ascending aorta.

CASE: A 63-year-old man presented with transient left hemiplegia and disturbance of consciousness. He did not have any medical history, but smoked one pack of cigarettes per day. Diffusion weighted magnetic resonance imaging revealed high-intensity signals in the right cortex of the parietal lobe. He again experienced the same symptoms, but improved thereafter. He was diagnosed with acute ischemic stroke, and ascending aortic dissection was suspected because his symptoms fluctuated. However, a thrombus, which was protruding in the ascending aorta, and right renal infarction were detected via contrast-enhanced computed tomography (CT). He was treated with unfractionated heparin to prevent further embolization. Transthoracic echocardiography did not show the thrombus, but four-dimensional coronary computed tomography angiography (4DCCTA) revealed its shape and mobility. Therefore, we strongly considered it to be a mobile thrombus that may have been the cause of ischemic stroke and a risk for further systemic embolization. Preoperative transesophageal echocardiography (TEE) did not reveal a patent foramen ovale, atrial septal defect, or a thrombus in the left atrial appendage. TEE as well as 4DCCTA images showed mobility of the thrombus in the ascending aorta, and no remarkable arteriosclerotic change. The patient underwent a median sternotomy to remove a segment of his ascending aorta, which was replaced with a prosthetic graft material. Pathological examination revealed a thrombus with a ruptured fibrous capsule that was a cholesterol-rich atherosclerotic plaque.

IMPACT/DISCUSSION: Four-dimensional CT is a three-dimensional computed tomography volume containing a moving structure and has previously been utilized in the setting of radiation therapy planning. We performed 4DCCTA to evaluate the movement of a thrombus in the ascending aorta. Since our patient had a further risk of ischemic stroke due to the thrombus in the ascending aorta, we needed to evaluate the state of the thrombus promptly to indicate early surgical intervention. Although TEE is an effective method to evaluate the mobility of the thrombus in the ascending aorta, recent upper gastrointestinal surgery, esophageal varices are contraindications and gastrointestinal perforation, aspiration pneumonia are complications for performing TEE. 4DCCTA could provide more complete evaluations in the aorta without blind spots compared with TEE. If TEE is contraindicated, or not available, 4DCCTA is an excellent alternative to detect and evaluate the mobile thrombus in the aorta.

CONCLUSION: 4DCCTA is an excellent alternative without blind spots to detect and evaluate the mobile thrombus in the ascending aorta.

UTILIZATION OF HIGH DOSE INSULIN EUGLYCEMIC THERAPY IN INTENTIONAL SOTALOL OVERDOSE

Bryan F. Stringer¹; Anantha Sriharsha Madgula¹; Anand Muthu Krishnan¹; Simrina Sabharwal². ¹University of Connecticut, Farmington, CT; ²University of Connecticut School of Medicine, Hartford, CT. (Control ID #3185738)

LEARNING OBJECTIVE #1: Recognize clinical and electrocardiographic findings in sotalol toxicity

LEARNING OBJECTIVE #2: Manage poison-induced cardiogenic shock with high dose insulin

CASE: Patient is an 83-year old male with past medical history of atrial fibrillation, hypertension, coronary artery disease, anxiety and depression presenting from home after being found unresponsive by family with multiple pill bottles nearby including lorazepam and sotalol. His last seen normal was the previous night. When paramedics arrived, patient was bradycardic to 20 bpm, atropine was given and he was transcutaneously paced. Norepinephrine was initiated and upon arrival to the emergency department he was intubated and a transvenous pacer was placed. On admission, vitals included pulse 80 bpm (paced), blood pressure 100/60, respiratory rate 14. Physical exam revealed an unresponsive male, but no other significant abnormalities. Labs were significant for urine toxicology positive for benzodiazepine, otherwise within normal limits. Computed tomography scan of the brain was negative for acute pathology. Initial electrocardiogram showed junctional bradycardia competing with sinus bradycardia at 30 bpm and QT/QTC of 707/498. Patient was transvenously paced and started on epinephrine and high dose insulin (HDI) for poison-induced cardiogenic shock. He was evaluated by toxicology and nephrology and transferred to intensive care unit where was started on continuous veno-venous hemofiltration. Due to profound hypoglycemia, patient was started on dextrose 25% infusion. After approximately 48 hours, the patient was able to be weaned off vasopressor support and HDI was discontinued. His transvenous pacer was turned off and he had an intrinsic rate of 50 bpm.

IMPACT/DISCUSSION: Beta blockers (BB) are one of the most common causes of poison-induced cardiogenic shock (PCIS). Toxicity typically presents with altered mental status, hypotension and bradycardia. PCIS can be difficult to manage and conventional therapies such as atropine, glucagon, cardiac pacing and vasopressors often offer only a transient response. High dose insulin therapy is an effective therapy in the management of PCIS. Its benefit is contributed to its inotropic properties, increased myocardial uptake of carbohydrates and vasodilation improving local microcirculation. To date, there is no randomized clinical trial, however numerous case reports and prospective observational studies have demonstrated benefit of initiating HDI early in patients with PCIS. Electrolyte abnormalities and hypoglycemia are frequently reported adverse effects and require vigilant monitoring. Our patient on HDI required an dextrose (D25) drip to maintain euglycemia.

CONCLUSION: Sotalol toxicity presents like other BB toxicities, with additional EKG changes such as QT prolongation. In patients with PCIS, early HDI can improve hemodynamics. HDI can have adverse effects including hypokalemia and hypoglycemia which require close monitoring. There is a need for randomized clinical trials to attest efficacy of HDI in PCIS.

VAGINAL BLEEDING IN A POST-MENOPAUSAL FEMALE: A CASE REPORT

Laith Numan; Nedaa Husainat; Omar Abughanimeh. University of Missouri-Kansas City, Kansas City, MO. (Control ID #3165199)

LEARNING OBJECTIVE #1: Recognize the rare presentation(s) of sarcoidosis, including vaginal bleeding/uterine mass.

LEARNING OBJECTIVE #2: Diagnose uterine sarcoidosis after excluding other etiologies with similar histopathology's.

CASE: A 63-year-old African American female with a history of iron deficiency anemia and uterine fibroids, presented to the gynecology clinic complaining of worsening vaginal bleeding. Computed tomography (CT) scan of the abdomen and pelvis showed a large uterus with multiple calcified masses and a dominant calcified mass communicating with the sigmoid colon, and severe bilateral hydronephrosis; which raised concerns of fibroid transformation to leiomyosarcoma. The patient declined uterine biopsy and underwent sigmoidoscopy, which detected a large malignant appearing mass. The mass was obstructing and had necrosis and hard tissue. Biopsy results showed benign colonic mucosa and microcalcification but no evidence of malignancy. Chest CT scan showed bilateral pulmonary nodules, with no evidence of hilar lymph nodes enlargement. Due to concerns of malignancy, a total abdominal hysterectomy, bilateral salpingo-oophorectomy and sigmoid resection with end colostomy were done. The patient tolerated the procedure well. Histological examination of the specimen demonstrated multiple noncaseating granulomas with no evidence of malignancy. Pathology stains to rule out tuberculosis and fungal infection were negative. Angiotensin-converting enzyme level was elevated. After a multi-team evaluation by Oncology, Pulmonology, and Rheumatology, the patient was believed to have isolated uterine sarcoidosis with invasion to the colon. This is a very unusual way for sarcoidosis to present with only a few documented cases in the literature.

IMPACT/DISCUSSION: Extrapulmonary sarcoidosis is common, however uterine sarcoidosis is extremely rare. Typically, patients presenting with extrapulmonary sarcoidosis will have pulmonary involvement. Isolated extrapulmonary sarcoidosis is very rare. Uterine sarcoidosis is an unusual way for sarcoidosis to present and is challenging to diagnose due to other common etiologies presenting with uterine bleeding. In terms of uterine histopathology: in sarcoidosis, noncaseating granulomas can be found in all the layers of the uterus. Meanwhile, tuberculosis usually spares the myometrium.

CONCLUSION: Uterine sarcoidosis is extremely rare, and the diagnosis can be a challenge. The presentation can be nonspecific, and without pulmonary symptoms, other etiologies of vaginal bleeding should be excluded before confirming the diagnosis. Identification of noncaseating granulomas is the key for the diagnosis, after ruling out other etiology that can present with the same histopathology. Invasion of adjacent organs is possible and will require surgery.

VANISHING BILE DUCTS FROM HODGKIN'S LYMPHOMA

Neil Evans; Amitabh Singh; Jennifer Schmidt; Kenn Vattathara. Saint Louis University, Saint Louis, MO. (Control ID #3186108)

LEARNING OBJECTIVE #1: Recognize vanishing bile duct syndrome (VBDS)

LEARNING OBJECTIVE #2: Categorize Hodgkin's lymphoma as a cause of VBDS

CASE: A 40-year-old woman with a history of asthma and a cholecystectomy presented with fevers, weight loss, dyspnea, lymphadenopathy, and fatigue. She was prescribed acetaminophen, azithromycin, prednisone, and oseltamivir for presumed flu-induced asthma exacerbation. Four days later, she presented with continued fevers, chills, epigastric pain, and jaundice. Labs showed: aspartate aminotransferase (AST) 225 Units U/L, alanine aminotransferase (ALT) 201 U/L, total bilirubin 11.3 mg/dL, and alkaline

phosphatase 771 U/L; previously these were normal. Hepatic autoimmune evaluation revealed an anti-nuclear antibody titer of 1:320 (speckled pattern), ANA titer 1:80, antimitochondrial antibody M2 titer 4.1 (positive), F-Actin IgG 10 U, viral hepatitis negative, and INR 1.3. Right upper quadrant ultrasound and MRI showed hepatomegaly. Liver biopsy showed bile duct paucity with periportal fibrosis. Steroids and Ursodiol were started for presumed azithromycin induced vanishing bile duct syndrome with improvements in AST/ALT and pruritis, however, bilirubin and alkaline phosphatase continued to uptrend. Patient returned 1 month later with fevers, melena, jaundice and neck swelling. Biopsy of a neck lymph node revealed Hodgkin's lymphoma. She began chemotherapy but progressed to renal failure, liver failure and passed away.

IMPACT/DISCUSSION: Vanishing bile duct syndrome (VBDS) causes progressive destruction of the intrahepatic bile ducts leading to cholestasis. It has several case reports for the condition every year with multiple etiologies found: drug-induced, immunologic, ischemic, infectious, metabolic, and malignant (specifically Hodgkin's lymphoma). Lymphoma remains a commonly reported cause of VBDS. Patients with VBDS associated with lymphoma often present with severe cholestatic hepatitis with autoimmune features. Cholestatic symptoms include: gallstones, hyperlipidemia, malabsorption, xanthelasmata, and fat-soluble vitamin deficiencies. VBDS often manifests 1-6 months after the initial cholestatic episode and is associated with fatigue, anorexia, abdominal pain, pruritis, and weight loss. VBDS has been identified as a paraneoplastic process of Hodgkin's lymphoma (HL). And importantly, HL associated VBDS patients do not recover unless remission of the HL.

CONCLUSION: This case illustrates the importance of avoiding anchoring bias with vanishing bile duct syndrome. Although VBDS is rare and poorly understood, it has a high morbidity and mortality if the underlying cause is not treated. 50% of Hodgkin's lymphoma patients have liver infiltration and a cholestatic hepatitis with VBDS on biopsy should prompt evaluation of B symptoms and possible work up for lymphoma.

VANITY COSTING THE VEINS

Ian Cormier; Michael P. Smith. University of Nebraska Medical Center, Omaha, NE. (Control ID #3186001)

LEARNING OBJECTIVE #1: Understand the link between off label use of testosterone and risk of hypercoagulability and thrombosis.

LEARNING OBJECTIVE #2: Recognize the presentation of mesenteric venous thrombosis as a differential for acute abdominal pain.

CASE: A 52 year old man presented with one week of vague abdominal pain exacerbated by oral intake. The patient's medical history was significant for traumatic splenectomy, anabolic-steroid use and hypogonadism. His medications included testosterone, anastrozole, and human chorionic gonadotropin supplements, which were managed by a private men's clinic. On arrival, the patient was afebrile and hypertensive but otherwise hemodynamically stable. Physical exam was significant for diffuse abdominal tenderness to palpation with guarding. Labs were significant for polycythemia and leukocytosis with a normal lactic acid and lipase. Workup was significant for elevated total testosterone, free testosterone and sex hormone globulin. A computed tomography angiogram of the abdomen revealed acute thrombosis of the portal vein and superior mesenteric vein. The patient was kept nil per os, placed on intravenous fluids, and initiated on a heparin infusion. He was gradually reintroduced to oral nutrition and was discharged home on daily enoxaparin injections for anticoagulation. At the time of discharge, his home testosterone boosting supplements were stopped.

IMPACT/DISCUSSION: Mesenteric venous thrombosis is a rare but potentially life threatening cause of abdominal pain. Common causes of

mesenteric venous thrombosis include intraabdominal malignancies and inflammatory processes, portal hypertension, acquired and inherited thrombophilias and myeloproliferative disorders. Certain medications and supplements, including testosterone replacement therapy (TRT) and drugs that indirectly increase levels of testosterone may promote a prothrombotic state that can lead to venous thrombosis. TRT causes an acquired prothrombotic state by stimulating erythropoiesis and inducing secondary polycythemia. The link between TRT and VTE, even in men without polycythemia, recently led to the US Food and Drug Administration (FDA) to require manufacturers to place a general warning in the labeling of all approved testosterone products regarding this risk. In the United States, there has been a sharp increase in the number testosterone prescriptions per capita within the last two decades. Many men are initiated on TRT for questionable indications such as sexual dysfunction and decreased energy, yet pathological hypogonadism remains the only indication for TRT. For men initiated on TRT, the Endocrine Society guidelines recommend checking hematocrit at baseline, 3-6 months after starting treatment, and then annually. The Endocrine Society guidelines also suggest stopping therapy if the hematocrit increases to 54 percent.

CONCLUSION: TRT is not a benign therapy and may be associated with life threatening VTE. TRT should be regulated to the standards of other prescribed medications.

VARICELLA ZOSTER VIRUS (VZV) VASCULOPATHY AS A POTENTIAL CAUSE OF ALTERED MENTAL STATUS IN AN IMMUNOCOMPROMISED HOST

Ryan Handoko; Eric I. Elliott; Sameer Khan; Maricar Malinis. Yale School of Medicine, New Haven, CT. (Control ID #3162737)

LEARNING OBJECTIVE #1: Recognize the atypical presentation of varicella zoster virus (VZV) in an immunocompromised host

LEARNING OBJECTIVE #2: Recognize VZV vasculopathy as an etiology of altered mental status in an immunocompromised host

CASE: This is a 48-year-old male with history of HIV/AIDS (CD4+ count=2 cells/mm³, HIV RNA=3.66 log copies/mL), nonadherence to antiretroviral therapy, 20-pack year smoking and polysubstance use, who was admitted after being found unresponsive. Diagnostic work-up identified a large right pneumothorax. His hospital course was complicated by polymicrobial pneumonia, MRSA bacteraemia, and gastrointestinal bleeding (GIB). Dolutegravir, darunavir, cobicistat, and opportunistic infection prophylaxes were initiated. He was transferred to our institution to treat pneumothorax refractory to pleurodesis with endobronchial valves. On exam, he had temporal wasting, rhonchi over right lung fields, and greasy scaled skin on his face consistent with seborrheic dermatitis. On hospital day 14, he became somnolent with failure to thrive, poor oral intake, and avolition, with no focal neurological deficits. Mirtazapine was given for depression but discontinued for worsening cytopenias. Neurology and psychiatry consultants recommended methylphenidate for CNS stimulation. Contrast-enhanced MRI of the brain revealed hemorrhage in both ganglio-capsular regions and subacute to chronic hemorrhage in the left caudate. Lumbar puncture was performed and CSF revealed 3 WBC/mm³, 41 mg/dL glucose, 20.1 mg/dL protein, and 0.8 U/L adenosine deaminase. Serum TPPA was negative. CSF Cryptococcal antigen, HIV RNA, CMV DNA, JC virus DNA, EBV DNA, HSV DNA, and Toxoplasma DNA were undetected by PCR. However, CSF VZV DNA was detected. CSF VZV IgG was not detected. IV acyclovir was initiated. He subsequently had recurrent GIB and hypoxemia and was transferred to medical step-down. Chest X-ray showed right lung collapse due to mucus plug. His family decided to pursue palliative measures only, and the patient thereafter expired.

IMPACT/DISCUSSION: VZV vasculopathy occurs in both immunocompetent and immunocompromised hosts. Up to 40% of patients present without the characteristic rash, and up to 33% lack CSF pleocytosis. Brain imaging nearly always shows pathology, including ischemic or hemorrhagic lesions involving large or small cerebral arteries. CSF VZV IgG is more sensitive than VZV DNA by PCR, which is only elevated transiently. In our case, CSF VZV IgG was likely undetected due to hypogammaglobulinemia in a severely immunocompromised host. However, detection of CSF VZV DNA secured the diagnosis. Overall, a comprehensive assessment of changes in mental status in an immunocompromised host must include a work-up for neuro-infectious processes, including VZV vasculopathy.

CONCLUSION: Altered mental status in an immunocompromised patient should include neuro-infectious etiologies such as VZV vasculopathy. Evaluation for VZV vasculopathy includes brain imaging and detection of either VZV IgG (more sensitive) or VZV DNA in CSF (more specific).

VEGETABLES > VEGETATIONS

Zhihang Zhang¹; Alexander Gipsman¹; Sarah W. Baron²; Daniel Sims³.

¹Montefiore Medical Center, New York, NY; ²Montefiore, Bronx, NY;

³Montefiore Medical Center, BRONX, NY. (Control ID #3181225)

LEARNING OBJECTIVE #1: Recognize bilateral infective endocarditis as extremely rare without prior cardiac disease or risk factors.

CASE: A 41-year-old man with past history of uncontrolled T1 Diabetes complicated by toe amputations, presents to the hospital in DKA with a concurrent chronic right foot ulcer with cellulitis. The patient had no history of intravenous drug use. MRI demonstrated osteomyelitis, and blood cultures were positive for methicillin-sensitive *Staphylococcus aureus* (MSSA). The patient was treated with IV nafcillin, however remained bacteremic for a total of 9 days despite appropriate antibacterial therapy, with 3 days of bacteremia post source control with bone debridement. Transthoracic echocardiography suggested a mobile structure attached to the interventricular septum below the left ventricular outflow tract (LVOT) measuring 0.9 x 0.3cm. Transesophageal echocardiography was performed to further characterize the pathology and assess for abscess, and discovered two distinct areas of vegetation, one in the left ventricle attached to the septum and an additional lesion in the right ventricle near the tricuspid annulus measuring 1.5cm x 1.2cm with possible abscess formation. CT imaging of the chest showed septic emboli in the lungs. During the hospital course, he developed a right wrist abscess due to septic emboli, and his foot was debrided for source control. Cardiac MRI for surgical planning confirmed bilateral vegetations. He then underwent removal of the vegetations in the right ventricle with repair of the tricuspid valve, with an uneventful recovery and discharge.

IMPACT/DISCUSSION: Bilateral endocarditis without prior cardiac pathology, prosthetic valve, vascular access, or IV drug use is extremely rare. The majority of infective endocarditis cases involve the left sided system alone, while right sided endocarditis is most associated with venous access infections. One retrospective review of infective endocarditis in patients without IV drug use over 14 years at one center showed that 39 (16%) were right sided and 204 (84%) were left sided. Of the right sided endocarditis cases, 36% had uncorrected congenital heart disease, and another 21% had central venous catheter access. On literature review of bilateral endocarditis without prior risk factors, case reports of 4 patients total, reported 2 patients with history of aortic valve replacements, and 2 patients without any predisposing condition, 3 of the 4 reported patients had *Staphylococcus aureus*, which is notably virulent enough to cause disease on previously normal valves. In our case of bilateral infective endocarditis, the only identified risk factor for this rare presentation was a history of uncontrolled diabetes.

CONCLUSION: Endocarditis deserves detailed multimodal imaging to guide management. Bilateral endocarditis without prior cardiac pathology or vascular access is extremely rare, and the authors report this case of bilateral infection with uncontrolled diabetes as the only identified risk factor.

VERTEBRAL OSTEOMYELITIS DUE TO EXTENDED SPECTRUM-LACTAMASE (ESBL) PRODUCING *ESCHERICHIA COLI* FROM A GENITOURINARY SOURCE

Mais Abdou¹; Sameer Prakash³; Muath Alsharif²; Steven Urban¹. ¹TTUHSC, Amarillo, Amarillo, TX; ²Texas Tech University Health Science Center, Amarillo, TX; ³Texas Tech University Health Sciences Center Amarillo, Amarillo, TX. (Control ID #3184531)

LEARNING OBJECTIVE #1: Recognize ESBL-producing gram negative bacilli as an uncommon cause of osteomyelitis especially after a urinary tract infection. Identify the clinical characteristics, diagnostic methods and management of vertebral osteomyelitis.

CASE: A 58-year-old male with past medical history of alcoholism, liver cirrhosis, atrial fibrillation and stage IV squamous cell carcinoma of the hypopharynx, status post radiation and ongoing nivolumab treatment, presented to the hospital with worsening lower back pain and chills for a week. He also reported nausea, vomiting, and anorexia. Two weeks previously, he had completed a one week course of a carbapenem for ESBL producing *E. coli*. The patient was afebrile, and physical exam was significant for lower extremities weakness, decreased reflexes and difficulty walking. Laboratory workup revealed normal white cell count, anemia and procalcitonin of 30. Urinalysis was unremarkable. MRI of lumbar spine showed hydrotic degeneration of T12-L1 disc with severe marrow edema and loss of height favoring T12/L1 osteomyelitis/discitis. Blood cultures showed no growth. CT-guided biopsy of T12/L1 disc and the adjacent portion of the T12 vertebral body revealed changes consistent with acute or chronic osteomyelitis, and needle aspiration culture grew ESBL producing *E. coli*. Neurosurgical intervention was not pursued. The patient was started on meropenem with a planned 6 weeks course. However, he was re-admitted to hospital two weeks later with sepsis, and this time blood cultures grew out ESBL producing *E. coli*. The patient's port-a-cath seemed to play a role in persistent infection and therefore was removed. TEE showed no evidence of endocarditis. A short course of gentamicin was added to meropenem. He was then continued on meropenem for the next 4 weeks with subsequent clinical improvement.

IMPACT/DISCUSSION: Vertebral osteomyelitis is a serious bone infection that is classically caused by gram-positive bacteria and less likely gram-negative bacilli. ESBL producing Enterobacteriaceae are rarely reported in the medical literature as the causative agents. The urinary tract is the most frequent reported source of infection. These microorganisms imply a significant challenge in terms of treatment. Carbapenems are the antibiotic class of choice for these infections with no current evidence favoring one carbapenem over another. Most studies favor an antibiotic course of 6-8 weeks of treatment.

CONCLUSION: ESBL-producing gram-negative rods should be considered as a causative agent for vertebral osteomyelitis in the setting of recent urinary tract infection. Blood cultures are positive in only 20-59% of the cases. CT guided biopsy is an important diagnostic method and should not be delayed, as obtaining culture and sensitivity is essential in guiding the treatment.

VISCERAL LEISHMANIASIS AS AN UNEXPECTED CAUSE OF PANCYTOPENIA IN A PATIENT WITH AIDS

Arie Szeinfeld¹; Eliran E. Zadikov¹; Kaitlyn E. Takach¹; Damian Casadesus².

¹American University of the Caribbean School of Medicine, Cupecoy, Sint

Maarten (Dutch part);²Jackson Memorial Hospital, Miami Beach, FL. (Control ID #3138395)

LEARNING OBJECTIVE #1: Recognize the importance of having Visceral Leishmaniasis on the differential in HIV-positive patients with pancytopenia.

CASE: A 29 year-old Hispanic male with past medical history of AIDS and multiple-associated co-infections including CNS toxoplasmosis, CMV retinitis, genital HSV, PCP, noncompliance and multiple substance abuse, presented to the ED with 10 days of watery non-bloody diarrhea, abdominal pain, fever, chills, anorexia and dry cough. Patient was admitted for similar symptoms nine months prior. Home medications included Atripla, Azithromycin, Bactrim and Leucovorin. On physical exam, he was awake and alert. Cardio-pulmonary examination was normal. The abdomen was tender with hepatosplenomegaly, but non-distended. Cervical lymphadenopathy was palpable. Labs revealed pancytopenia: WBC: $2.3 \times 10^3/\mu\text{L}$; Hgb: 7.8 g/dL; Hct: 22.8%; Platelets: 124; LDH: 719. HIV viral load was 12,000 and CD4 count was 1 cell/ μL . Chest radiography showed bibasilar patchy opacities suggesting PCP pneumonia and Bactrim was started. Persistent pancytopenia prompted a bone marrow biopsy which demonstrated Donovan bodies consistent with Leishmaniasis. Esophagogastroduodenoscopy and colonoscopy were performed due to persistent diarrhea and biopsy was also consistent with Leishmaniasis. The patient was started on Amphotericin B (21mg/kg inpatient for 2 weeks and infusions 1q/week for a total of 6 weeks outpatient) with resolution of the digestive symptoms. Patient followed up in the clinic with improvement of the pancytopenia.

IMPACT/DISCUSSION: Visceral Leishmaniasis (VL) is caused by a parasitic infection characterized by fever, pancytopenia and hepatosplenomegaly with progressive host deterioration. To date, there have been less than six reported cases of HIV with Leishmaniasis co-infection in the United States, thus far all imported. Incidence of VL is increasing in the developed world secondary to climate change, which has extended the natural habitat of the Leishmania vector into the southern United States. This case demonstrates the importance of having VL on the differential in HIV-positive patients with pancytopenia. There is debate regarding adding VL to the list of AIDS-defining opportunistic infections; therefore, a diagnosis of VL should prompt HIV screening. This is especially relevant as the mortality rate in patients with AIDS/Leishmaniasis co-infection is 53.7% as opposed to 7.5% in HIV-negative patients.

CONCLUSION: AIDS patients often present with significant hematologic abnormalities such as anemia, lymphocytopenia, thrombocytopenia and various coagulopathies. These irregularities stem from a variety of HIV-associated sources including opportunistic infections, malignancies or as consequences of treatment therapies such as antiretroviral therapy. Physicians should be aware of VL when evaluating an HIV-positive patient with pancytopenia and should consider performing bone marrow biopsy.

VITAMIN B12 DEFICIENCY: AN UNDERAPPRECIATED CAUSE OF HEMOLYTIC ANEMIA

Hannah Levavi; Rose Yu; Athanasia Vasiliadis. Mount Sinai Hospital, New York, NY. (Control ID #3186151)

LEARNING OBJECTIVE #1: Recognize vitamin B12 deficiency as a cause of hemolytic anemia

LEARNING OBJECTIVE #2: Identify factors that can mask the diagnosis of vitamin B12 deficiency

CASE: A 69 year old woman with beta thalassemia trait presented to her primary care physician with two months of progressive dyspnea. Laboratory

evaluation revealed hemoglobin 5.2 g/dL, mean corpuscular volume (MCV) 94.0 fL and red cell distribution width (RDW) 41%. Other cell lines were within normal range. The patient was hospitalized for symptomatic anemia. Further evaluation revealed a mild, unconjugated hyperbilirubinemia, with total bilirubin 1.7 mg/dL and direct bilirubin 0.9 mg/dL, low haptoglobin <8 mg/dL, elevated lactate dehydrogenase 7436 U/L, reticulocytes 2.5%, normal folate level, normal direct coombs, and vitamin B12 <150 pg/mL. Eventually, intrinsic factor antibodies were identified at 61.0 AU/mL. Two units of packed red blood cells were transfused and vitamin B12 was repleted with serial injections of cyanocobalamin 1000 mcg. Oral iron and folate supplementation were also provided in anticipation of accelerated hematopoiesis. In the follow-up period, the patient had dramatic improvement in anemia.

IMPACT/DISCUSSION: Vitamin B12 is a key cofactor in DNA synthesis. When it is depleted, anemia manifests due to the rapidly dividing nature of hematopoietic precursors. Dissociation between cytoplasmic and nuclear maturation leads to production of large, immature megaloblasts with impaired functionality, which then undergo premature intramedullary cell death. Although the pathogenesis of the hematologic changes from B12 deficiency is well described, the clinically apparent effects of B12 deficiency are not always straightforward. Before clinically evident anemia develops, B12 deficiency causes early red cell morphologic changes. However, despite this, MCV does not correlate with the degree of B12 deficiency, and some studies find that the majority of patients with B12 deficiency have a normal MCV. The degree of B12 deficiency required before markers of intramedullary hemolysis appear is not known, and vitamin B12 deficiency present with serum bilirubin levels high enough to cause jaundice only rarely. In the current case, our patient had profound intramedullary hemolytic anemia due to B12 deficiency from pernicious anemia, yet her MCV was within the reference range. Confounding her presentation was the fact that pre-existing beta thalassemia trait resulted in two populations of RBCs: one megaloblastic and one microcytic. This fact serves as a reminder to pay close attention to additional red cell indices, such as RDW, which can suggest two simultaneous pathologic mechanisms.

CONCLUSION: The spectrum of manifestations of vitamin B12 deficiency can range from isolated morphologic changes in erythroid cells to overt hemolytic anemia. Despite the classic teaching that megaloblastic anemia results in an elevated MCV, the MCV is not alone a reliable marker of B12 deficiency, especially in patients with co-occurring microcytosis.

WARBURG AND THE RUNAWAY LACTATE

Nadine Pardee; John Penner; Brad Sharpe. University of California San Francisco, San Francisco, CA. (Control ID #3184776)

LEARNING OBJECTIVE #1: Construct a differential diagnosis for lactic acidosis in the absence of systemic hypoperfusion.

LEARNING OBJECTIVE #2: Recognize the clinical features of the Warburg effect in the setting of active malignancy.

CASE: A 36 year-old man with HIV and a history of diffuse large B-cell lymphoma (DLBCL) was admitted with three days of severe left wrist pain. He was on emtricitabine, tenofovir, and dolutegravir for his HIV. His DLBCL had been treated with chemotherapy and was in remission based on recent imaging. He was afebrile, tachycardic, and normotensive. He was thin and ill-appearing, with severe pain in his left wrist without effusion or erythema. He had a white blood cell count of 3.3 cells/mm³ and a mild anemia. His lactate was 4.6 mg/dL with a normal anion gap and creatinine. A computed tomography of the left upper extremity showed focal areas of demineralization of unclear etiology. His blood pressure and heart rate remained unchanged. His lactate rose despite fluid boluses. He was changed to an NRTI-sparing ARV regimen and given empiric high-dose thiamine. He denied metformin,

salicylate, or albuterol use. His lactate rose to 15.1 mg/dL and he developed new hypoglycemia that persisted despite D10% bicarbonate infusion at 500cc/hour. His lactate then rose to 22.3 mg/dL. Given the severe hyperlactatemia and hypoglycemia in the setting of prior DLCBL, there was a concern for a Warburg effect. A bone marrow biopsy demonstrated recurrent DLBCL. The wrist pain was felt to be secondary to bone marrow infiltration by his lymphoma. He was given palliative chemotherapy and his serum pH, lactate, and glucose levels improved. Unfortunately, on hospital day 25, he passed away.

IMPACT/DISCUSSION: Lactic acidosis is a common problem in the hospital setting. While type A lactic acidosis, a result of tissue hypoperfusion, is the most common, the differential for a type B lactic acidosis, an impairment of cellular metabolism, is less readily encountered. Type B lactic acidosis may be secondary to: 1) Increased metabolic demand (e.g. seizure) 2) Liver disease 3) Renal disease 4) Medications: metformin toxicity, alcohols, propofol, linezolid, NRTIs, or salicylate overdose 5) Thiamine deficiency 6) Increased glycolysis from cocaine ingestion, albuterol, pheochromocytoma or the Warburg effect. The Warburg effect results from an oncogenic switch to increased glycolysis, with avid glucose consumption and consequential lactate production. It is often seen in lymphoproliferative disorders and may or may not present with hypoglycemia. These metabolic derangements can be the initial presenting sign of malignancy and are a poor prognostic indicator. As in our case, the lactic acidosis can worsen with administration of dextrose, supporting the hypothesis that tumor cells aggressively consume glucose and rapidly convert it into lactate.

CONCLUSION: Providers should consider type B lactic acidosis in patients with hyperlactatemia and be aware of the Warburg effect in patients with lymphoproliferative disorders.

WARFARIN - IT'S NOT JUST BLEEDING RISK

Alexandra Barger; Hannah Oakland. Tulane University School of Medicine, New Orleans, LA. (Control ID #3184462)

LEARNING OBJECTIVE #1: Recognize warfarin as a cause of calciphylaxis

LEARNING OBJECTIVE #2: Identify calciphylaxis as a cause of painful ulcers in patients with no history of ESRD

CASE: A 50-year-old man presented bilateral lower extremity ulcers for 4 months. One week before presentation, ulcers were debrided and then became very painful. Purulent drainage and fever then developed prompting him to seek medical care. He has a history of atrial fibrillation on chronic anticoagulation with warfarin and type 2 diabetes mellitus. He was afebrile with a HR of 114bpm. A 6cm wound of the left medial shin with yellow purulent drainage and a 2cm RLE medial wound with small amount of purulence were present. WBC was elevated at $14 \times 10^9/L$. Renal function was normal. Arterial duplex ultrasound revealed only mild arterial disease. Pain was controlled and he was discharged on antibiotics. Several weeks later, he returned with uncontrolled pain. A biopsy of the ulcers was performed and returned with focal calcium deposits in subcutaneous fat, with vascular involvement and extensive fat necrosis consistent with calciphylaxis. He was diagnosed with warfarin-induced non-uremic calciphylaxis and was transitioned to apixaban for anticoagulation.

IMPACT/DISCUSSION: Calciphylaxis is a small-vessel disease involving calcification of subcutaneous arterioles and resultant cutaneous necrosis, classically seen in patients with end-stage renal disease (ESRD) but can develop in patients without renal disease. While calciphylaxis in ESRD is thought to be related to hypercalcemia, secondary hyperparathyroidism, or hyperphosphatemia, non-uremic calciphylaxis (NUC) occurs in patients with

normal calcium and phosphate levels, and the pathogenesis is not completely understood. Increasingly, warfarin use is being identified as an independent cause of NUC. Calciphylaxis is characterized by medial calcification and intimal fibrosis of arterioles, followed by thrombotic occlusion and ischemia leading to tender, erythematous lesions which can develop into open ulcerations with possible progression to gangrene or sepsis. Calciphylaxis lesions are typically intensely painful, similar to ulcers caused by atherosclerotic peripheral artery disease. One-year mortality rate of those afflicted, regardless of etiology, is approximately fifty percent, with most deaths due to sepsis. The mechanism by which warfarin is thought to cause calciphylaxis is via inhibition of matrix Gla protein, which allows inappropriate calcification of blood vessels. Other risk factors for NUC are hyperparathyroidism, malignancy, alcoholic liver disease, connective tissue disease, female gender, white race, steroid use, diabetes, albumin or blood transfusions, and protein C or S deficiency.

CONCLUSION: With a high associated mortality, it is important for the internist to recognize calciphylaxis as a cause of painful ulcers in patients without advanced renal disease. Warfarin has been recognized as a cause of calciphylaxis.

WAS IT THE BEER OR THE BURGERS

Ian Cormier; Michael P. Smith. University of Nebraska Medical Center, Omaha, NE. (Control ID #3186069)

LEARNING OBJECTIVE #1: Recognize hypertriglyceridemia as a cause of pancreatitis

LEARNING OBJECTIVE #2: Recognize the effects of hypertriglyceridemia on common laboratory evaluations

CASE: A 27-year-old man presented with six hours of severe abdominal pain. The pain was sharp, constant and located across the upper abdomen and radiated to his back. There was associated nausea and vomiting of non-bloody, non-bilious emesis. The patient had consumed a large quantity of alcohol prior to presentation. He had a history of alcohol dependence complicated by withdrawal seizures and frequent episodes of acute pancreatitis requiring hospitalization. Vitals were within normal limits. His BMI was 22. The patient was intoxicated and had marked tenderness to palpation over the left upper quadrant and epigastric area with rebound tenderness. Labs were significant for elevated blood alcohol level, elevated lipase, hyponatremia, hyperkalemia, hypocalcemia, hypermagnesemia and a normal serum osmolality. An ECG revealed no acute abnormalities. Staff from the chemistry lab described the patient's serum as lactic. A lipid panel revealed triglycerides greater than 5000 mg/dL. Repeat point-of-care-testing of the patient's serum revealed normal electrolyte levels. CT of the abdomen revealed heterogeneous enhancement of the pancreas consistent with acute pancreatitis. The patient was started on intravenous fluids and pain management. He started on an insulin drip with 5% dextrose and fenofibrate for his hypertriglyceridemia. He was eventually discharged on gemfibrozil.

IMPACT/DISCUSSION: Acute pancreatitis is a commonly encountered diagnosis and is the most common gastrointestinal reason for hospitalization. Approximately 75% of cases of acute pancreatitis are caused by gallstones or alcohol consumption. In contrast, hypertriglyceridemia only accounts for 2-4% of acute pancreatitis cases. Though the etiology of acute pancreatitis is usually unambiguous, one must always keep a systematic approach. Pancreatitis in the setting of coexisting hypertriglyceridemia and excessive alcohol consumption is potentially confounding. This case also illustrates the interesting relationship between elevated serum lipids and measured serum electrolytes. The presence of elevated lipids increases the non-aqueous components of the serum with a concomitant decrease in the fraction of serum composed of

free water. This phenomenon, termed the electrolyte exclusion effect, is common with the use of flame photometry or indirect potentiometry. However, this artifact does not occur with the use of direct potentiometry, as this method directly measures the concentration of electrolytes in the water phase of serum. Point-of-care-testing is more accurate in the setting of severe hypertriglyceridemia as it utilizes direct ion-selective electrodes. This can be used in the setting of hypertriglyceridemia or hyperproteinemia to obtain more precise results.

CONCLUSION: Hypertriglyceridemia is a necessary part of a systematic approach to evaluating patients with pancreatitis

WATERSKIING GONE WRONG: HAMSTRING INJURY FOR THE INTERNIST

Lily Kombluth¹; Carlin Senter². ¹UCSF, San Francisco, CA; ²University of California San Francisco, San Francisco, CA. (Control ID #3165778)

LEARNING OBJECTIVE #1: Determine when imaging is indicated for hamstring injuries

LEARNING OBJECTIVE #2: Define indications for orthopedic referral for hamstring injuries

CASE: HPI: A 50-year-old healthy gentleman presents to urgent care after a waterskiing accident with posterior right thigh pain. As he tried to stand on water skis, his right leg was thrust in front of him with significant force. He immediately felt a tearing pain down the back of the right thigh and subsequently was unable to bear weight on the right lower extremity. Focused physical exam: Gait: ambulates with crutches, unable to bear weight on the right leg. Inspection: hematoma of the posterior right thigh. Palpation: tenderness of the posterior thigh just distal to the ischial tuberosity. No soft tissue defect. Range of motion: pain with flexion of the right hip. Strength: 4/5 strength on resisted right hip extension and right knee flexion. Strength otherwise 5/5. Sensation: intact.

IMPACT/DISCUSSION: Hamstring injuries are common and may first present to the internist. The most common injury is a mid-muscle strain or tear that is managed with rest and physical therapy. A less common but more concerning injury is a tear of the proximal hamstring tendons. Suspect proximal hamstring tendon tear based on the severity of the mechanism of injury, as in this vignette where the patient's leg was thrust forward with high speed and force. Physical exam in tendon rupture may reveal a hematoma over the posterior thigh accompanied by loss of hamstring muscle function. Palpation is a key exam finding: the more proximal the tenderness of the hamstring (i.e. the closer to the ischial tuberosity), the more concerning for tendon injury. Imaging is indicated if tendon rupture is suspected. Urgent AP pelvis X-ray and hamstring MRI are standard for evaluating for tendon rupture. MSK ultrasound can be a useful alternative to MRI in the acute setting to characterize the injury. Urgent referral to orthopedics is indicated for proximal hamstring tendon rupture as patients with rupture of two or three of the hamstring tendons have better functional outcomes with prompt operative repair. Non-urgent referral to orthopedics is indicated for other hamstring injuries that do not improve with rest and physical therapy.

CONCLUSION: Given the traumatic mechanism of injury for this patient and large posterior thigh hematoma, MRI was ordered to evaluate for hamstring rupture. Unfortunately, the MRI was not covered by the patient's insurance and so was not performed. He was subsequently evaluated by a Primary Care Sports Medicine physician who performed a point-of-care ultrasound. This showed hamstring muscle tear without tendon involvement. He was treated with a 12-week course of physical therapy with gradual improvement.

WE CAN'T AFFORD NOT TO TREAT: THE COSTS OF WITHHOLDING OPIOID USE DISORDER (OUD) TREATMENT DURING INCARCERATION

Samantha Siskind; Karen Hannon; Jessica Taylor. Boston Medical Center, Boston, MA. (Control ID #3184851)

LEARNING OBJECTIVE #1: Describe the clinical, human rights, and financial costs of interrupting OUD treatment during incarceration

LEARNING OBJECTIVE #2: Counsel patients on the elevated risk of overdose in the post-incarceration period

CASE: A 64-year-old man with prior incarceration, severe OUD, and cocaine use disorder relapsed with a single use of crack cocaine. A urine drug screen performed by his parole officer returned positive and he was incarcerated for two weeks. His prescribed buprenorphine/naloxone was withheld, as per jail policy, and he experienced severe withdrawal. Shortly after release, he overdosed and was immobile for > 24 hours. He presented to the emergency department with leg pain and urinary retention. Exam revealed fever, tachycardia, a 10 x 4 cm wound on his right thigh, and crackles at his lung bases. Labs showed leukocytosis, acute kidney injury (AKI), and a creatinine kinase of 7,116 U/L. He was admitted for six days with pneumonia, AKI, pressure necrosis, and rhabdomyolysis. Non-healing of his thigh wound led to a second admission. The complications of his overdose resulted in \$25,853 billed to his state Medicaid program.

IMPACT/DISCUSSION: Criminal justice exposure is common among people with OUD. Although opioid agonist therapy (OAT) reduces relapse and overdose, it is prohibited in many correctional settings due to concern for diversion and safety, logistical barriers, and stigma. Less than one percent of U.S. jails and prisons offer OAT. This patient suffered a feared consequence of OUD in the post-release period: overdose. Due to decreased tolerance after a period of abstinence and the post-release community context, which often includes low social and economic support, exposure to drug use, isolation and hopelessness, the overdose death rate post-release is 120 times that of the general population. A growing body of evidence shows that treating incarcerated individuals with OAT decreases the risk of overdose. Policies denying OAT to inmates have recently been challenged in court as violations of the Eighth Amendment and the Americans with Disabilities Act. Corrections officials have cited cost as a barrier to OAT provision. While the cost of medication, secure storage, and observed administration are important considerations, medication costs at wholesale pricing would likely have been less than \$20/day, contributing to total costs far below the \$25,853 that resulted in this case.

CONCLUSION: Withholding evidence-based treatment for OUD during periods of incarceration is associated with significant harms. Physicians should counsel patients on the high risk of overdose in the post-release period and discuss strategies to reduce overdose, including OAT and intranasal naloxone. Physicians should also continue to advocate for access to OAT in correctional facilities. Including financial arguments may increase support for this evidence-based treatment.

WE MUST ALWAYS ASK "WHY" — A CASE OF HYPERTRIGLYCERIDEMIA-INDUCED ACUTE PANCREATITIS

Abdul Rehman¹; Manasa Ayyala². ¹Rutgers-New Jersey Medical School, Newark, NJ; ²Rutgers New Jersey Medical School, Newark, NJ. (Control ID #3171723)

LEARNING OBJECTIVE #1: Identify hypertriglyceridemia as a cause of acute pancreatitis

LEARNING OBJECTIVE #2: Recognize insulin infusion and apheresis as definitive therapies for hypertriglyceridemia-induced pancreatitis

CASE: A 45-year-old man with a history of hyperlipidemia and gout presented to the emergency room with dizziness for 1 day. He reported having epigastric discomfort and black tarry stools intermittently for 2 weeks. He endorsed taking ibuprofen during this time. Social history was notable for heavy use of alcohol (15-20 drinks of vodka weekly). Physical exam was notable for tachycardia, orthostatic hypotension, and epigastric pain. In addition, generalized pallor and mild scleral icterus were noted. Laboratory investigations revealed anemia (hemoglobin 10.3 g/dL), abnormal liver function tests (alanine aminotransferase 725 U/L, aspartate aminotransferase 763 U/L and alkaline phosphatase 419 U/L), elevated lipase (173 U/L) and lactic acidosis (lactate 6.1 mmol/L). He was admitted to general medicine for further management. Questioning the etiology of the elevated lipase, the work-up was expanded to evaluate for acute pancreatitis including a fasting lipid panel. Results were notable for a serum triglyceride level of 2,923 mg/dL. Insulin infusion along with dextrose 5% plus sodium chloride 0.45% infusion was started and the patient was transferred to the intensive care unit. Apheresis was tentatively planned. The following day, serum triglycerides had improved to 820 mg/dL and epigastric discomfort had resolved. Subsequently, he underwent esophagogastroduodenoscopy which showed a clean-based gastric ulcer and hypertensive portal gastropathy. Endoscopic ultrasonography of the biliary tree was only notable for biliary sludge but negative for any calculi or mass lesion. His serum triglyceride levels continued to improve and he was subsequently discharged from the hospital.

IMPACT/DISCUSSION: Hypertriglyceridemia is the third most common of acute pancreatitis after alcoholic and biliary pancreatitis. Serum triglycerides undergo hydrolysis by pancreatic lipase to form free fatty acids which induce free radical injury to the pancreatic parenchyma. Generally, acute pancreatitis is attributable to hypertriglyceridemia if the serum triglyceride level is greater than 1,000 mg/dL. In rare cases, serum lipase may be falsely normal. Management of hypertriglyceridemia-induced acute pancreatitis is similar to that for other causes of pancreatitis with the caveat that additional interventions are needed to normalize serum triglyceride levels. Insulin infusion and/or apheresis are two commonly used modalities to normalize serum triglyceride levels.

CONCLUSION: In patients with heavy alcohol use and epigastric pain, pancreatitis due to hypertriglyceridemia must be considered in the differential diagnosis. Insulin infusion and apheresis are the two definitive therapies employed to normalize serum triglyceride levels.

WEIGHT LOSS IN A SALVADORAN WOMAN: THROUGH THE MIGRATION LENS

Jordana Laks. Boston University School of Medicine, Dorchester, MA. (Control ID #3186366)

LEARNING OBJECTIVE #1: Recognize the health consequences of recent migration

LEARNING OBJECTIVE #2: Assess for trauma in an immigrant patient

CASE: A 34-year-old woman from El Salvador presented to a community health center for unintentional weight loss. She reported losing an unknown amount of weight over the past month such that her clothes felt looser. She denied any appetite change, fevers, night sweats, heat intolerance, or gastrointestinal symptoms. When asked about depression symptoms, she endorsed tearfulness and difficulty sleeping since her arrival in the United States three weeks ago. Past medical history and family history were non-contributory. She did not take any medications and denied smoking, alcohol, or drug use. She was currently living with her uncle and searching for work as a tailor. On

physical exam, the patient's weight was 134 pounds, down about 10 pounds from her self-reported usual weight, with a normal body mass index of 23 kg/m². She had a sad and blunted affect. Basic laboratory tests were unremarkable except for a mild normocytic anemia. At her one-month follow-up appointment, the patient disclosed that she fled her home because of gang violence. She had witnessed gang members kill her brother and niece. She and her daughter walked most of the way on their journey from El Salvador. They had limited access to food, water, and shelter. She was worried about her financial insecurity and distressed by thoughts of family members still in El Salvador. The patient was seen by a mental health provider with trauma expertise. She declined antidepressant pharmacotherapy. She was informed of local resources for free and low-cost food.

IMPACT/DISCUSSION: Refugees in the United States may present to primary care settings with symptoms triggered by migration and trauma. In this case, the patient's unintentional weight loss occurred after her physically arduous journey from El Salvador with poor access to food. This case illustrates the importance of opening a dialogue about the patient's reason for leaving their home country and details of their journey. In recent years, increasing numbers of families from El Salvador, Honduras, and Guatemala are arriving in the U.S. fleeing gang violence and extreme poverty. The World Health Organization has described health harms during migration including deprivation, extreme weather exposure, accidental injuries, and physical and sexual violence. History of trauma is particularly common among Central American migrants. In one study of families arriving at the United States-Mexico border, 83% of participants cited violence as a reason for migration and 32% met criteria for post-traumatic stress disorder. Recent immigrants may be hesitant to disclose trauma due to avoidance of painful emotions and/or fear of political persecution and stigma.

CONCLUSION: Health care providers should ask about prior physical and mental trauma when seeing newly arrived immigrant patients regardless of their chief complaints.

WERNICKE'S ENCEPHALOPATHY FROM POOR NUTRITIONAL INTAKE PRESENTING AS ACUTE ONSET APHASIA

Saloni Kapoor; Danica Smith; Kristin Berger. University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #3184236)

LEARNING OBJECTIVE #1: Suspect Wernicke's encephalopathy in elderly patients presenting with acute onset encephalopathy

CASE: Mrs S is an 82 years old female with history of left parietal lobe meningioma status post resection 1 year back complicated by partial seizures, hypertension, peripheral vascular disease, a stable 4mm left PICA aneurysm and an admission 6 months back for post ictal confusion who presented with acute onset aphasia, confusion, and difficulty ambulating. Patient lives and functions independently at baseline and was last seen normal the night before presentation. In the ED, her vitals and labs were unremarkable. NIH stroke score was 17. CT head was negative for acute pathology. CTA Head and neck without major occlusion, no significant change in 4 mm left PICA aneurysm. MRI brain demonstrated restricted diffusion/enhancement of the left hippocampal cortex. EEG showed left temporal periodic lateralizing epileptic discharges but no seizure activity. TSH, thyroid antibody, HgbA1c were within normal limits. A lumbar puncture demonstrated tube 4 with 2 WBC, 0 RBC, 120 glucose, 68 protein. Subsequently HSV, CMV, VZV, WNV, paraneoplastic panel and anti thyroid antibodies came back negative. Vitamin B1 level was reported as undetectable. She was started on IV Thiamine supplementation. After 3 days she had complete resolution of aphasia. She had reduced her food intake over the past few months as she

had not been feeling hungry. Her mental status changes were felt to be secondary to Wernicke's encephalopathy (WE) from poor nutrition.

IMPACT/DISCUSSION: Underdiagnosis of Wernicke's has been widely reported based on autopsy results. The triad of encephalopathy, oculomotor dysfunction and gait ataxia at presentation is an exception, rather than the rule. Most patients present only with mental status abnormalities, as with our patient. While chronic alcoholism is certainly the most common underlying pathology, upto 23% cases have been attributed to other causes including poor nutritional intake. Mammillary body atrophy is the classical sign found on imaging and is very specific for WE. Other MRI findings typical of WE are enhancement of thalamus and periaqueductal gray. In non alcoholic WE atypical MRI findings have been reported and hippocampal enhancement might represent another such case. Untreated, thiamine deficiency can progress to coma. Delayed treatment correlates with increased residual deficits. Given the complete and acute reversibility, early diagnosis is crucial. A high level of suspicion needs to be maintained, especially in elderly patients who may not have sufficient nutritional intake in the setting of dementia or deconditioning.

CONCLUSION: 1. Wernicke's encephalopathy does not usually present with the classic triad of encephalopathy, ataxia and oculomotor abnormalities 2. High suspicion for Vitamin B1 deficiencies in elderly patients presenting with neurological complaints, even without history of alcohol use or malabsorption

WHAT HAPPENED? TRANSFERENCE AND COUNTERTRANSFERENCE PHENOMENA IN A CLINICAL ENCOUNTER

Ashwini C. Bapat; Emeric Bojarski. Massachusetts General Hospital, Boston, MA. (Control ID #3172958)

LEARNING OBJECTIVE #1: Recognize transference(T) and countertransference(CT)

LEARNING OBJECTIVE #2: Employ a methodical approach to prevent the harmful consequences of transference phenomena(TP)

CASE: A 54-year-old male with opioid use disorder and lung cancer presents for management of cancer-related pain. His tumors have shrunk with treatment. He reports aching, severe, left-sided chest pain. He continues to exercise. He is on MS Contin 90 mg 3 times a day and oxycodone 20 mg every 4 hours as needed, which he takes around the clock regardless of pain level. On exam, he sits and walks comfortably. The clinician suggests opioid down-titration in the setting of a shrinking tumor, meeting functional goals, and concern for oxycodone misuse. The patient responds in anger. T: The patient may feel stigmatized. He has likely been dismissed as a 'junkie' in the past, within the healthcare system or from family due to substance use. He interprets tapering of opioids as a sign the clinician no longer believes his pain reports, leading to reactivation of feelings of helplessness and abandonment. This impacts his willingness to discuss analgesic approaches. CT: The clinician, influenced by prior patients with substance use disorder who diverted or misused opioids, may anticipate another episode of betrayal from this patient with a substance use disorder, reactivating feelings of helplessness and abandonment. To avoid these feelings, the clinician desires to quickly decrease the opioids, severely enforce the terms of the taper, and spend less time with the patient, compromising care. Reflection: Both the patient and clinician act out transferred feelings of helplessness and abandonment. A clinician unaware of TP may fail to appropriately assess pain and discuss management. A clinician attuned to TP can utilize a methodical approach of self-reflection to manage their countertransference, enabling a more effective discussion and plan for pain management.

IMPACT/DISCUSSION: T is the unconscious redirection of a patient's feelings, attitudes, desires, about a person in their earlier life, onto the clinician, while CT is the unconscious redirection of a clinician's feelings, attitudes, and desires about a person in their earlier life onto the patient. TP is not inherently pathologic, nor does it reflect failure of the clinician or patient. This topic is particularly relevant for internists who frequently care for ill patients with concomitant substance use disorders who evoke intense, often unexamined emotions. Most internists lack the training to recognize and understand this phenomenon, hence transference feelings go unrecognized and can contribute to inappropriate medical care and physician burnout. This case illustrates this phenomenon, highlights the negative impact on patient care, and illustrates how a methodical approach can mitigate the negative consequences

CONCLUSION: Unexamined TP can negatively impact care. A methodical approach to self-reflection can prevent harmful consequences

WHAT HAPPENS ONCE CAN HAPPEN TWICE.

Naoki Okawa¹; Makito Yaegashi¹; Sandra Moody². ¹Kameda Medical Center, Kamogawa, Japan; ²Kameda Medical Center, Kamogawa City, Japan. (Control ID #3178841)

LEARNING OBJECTIVE #1: Recognize that necrotizing fasciitis (NF) can recur.

CASE: A 94-year-old man with poorly controlled diabetes mellitus (DM), chronic kidney disease (CKD), and coronary artery bypass surgery presented to our clinic with right upper limb erythema and pain for two days. One day before admission, he noticed erythema and purple discoloration of his right wrist. On physical examination, he appeared ill. His blood pressure was 93/57 mmHg, temperature 37.6°C, pulse 86 beats per minute, respiratory rate 18 per minute, and pulse oximetry 98% in ambient air. There was a large painful dark purple area of his right upper limb, from his wrist to his shoulder. Laboratory studies were remarkable for a white blood cell count of 14,500/ μ l with 94% neutrophils, hemoglobin 7.3g/dl, blood urea nitrogen 73 mg/dl, and creatinine 2.88 mg/dl. Over the next two hours, the blood pressure fell to 80/50 mmHg. Intravenous (IV) vancomycin and piperacillin/tazobactam was started empirically with a vasopressor. He was admitted to the intensive care unit and treated with surgical debridement. During the debridement purulent exudate and discoloration of the fascia were observed. Since cultures from blood and tissue revealed the same strain of *E. coli* sensitive to all antibiotics except ampicillin, antibiotics were de-escalated to cefazolin. In addition, hyperbaric oxygen therapy was initiated. He became stable and finished a 21-day course of IV antibiotic therapy. Twelve days later, he became febrile and tachycardic. Over the next ten hours, his condition deteriorated, and he became comatose. At this presentation, his left elbow and surrounding area were noted to be erythematous with blistering and severe tenderness. Since recurrent NF was suspected, meropenem and a vasopressor were started. His condition deteriorated rapidly and he died within six hours. *E. coli* with the same sensitivity profile was detected from his blood and tissue. His autopsy confirmed the diagnosis of recurrent NF.

IMPACT/DISCUSSION: NF is categorized by polymicrobial or monomicrobial. *E. coli* is usually isolated from polymicrobial NF, but has rarely been reported in monomicrobial NF. Monomicrobial NF due to *E. coli* has also been reported in immunocompromised or diabetic patients; it is rare. In addition, recurrent NF is very rare, and only seven cases have been reported previously. Our patient had several predisposing factors that made him susceptible to NF—poorly controlled DM and CKD. Though it is unclear whether he had a recrudescence of NF from hematogenous seeding

or a recurrence, we believe his second episode was a recurrence since he remained stable for twelve days after completion of the previous treatment. Recurrent NF should be included in the differential diagnosis in patients with a previous episode. Appropriate antibiotic therapy, early diagnosis and surgical debridement are extremely important for this rare, but deadly disease.

CONCLUSION: Recurrent NF is very rare, but should be excluded in patients with a previous episode of NF.

WHAT LIES BENEATH CATATONIA

Anna Apostolopoulou; Anita Leon-Jhong. UPMC, Pittsburgh, PA. (Control ID #3179070)

LEARNING OBJECTIVE #1: Recognize the signs of malignant catatonia timely

LEARNING OBJECTIVE #2: Initiate management of malignant catatonia with high doses of benzodiazepines (BZs) in the ICU

CASE: A 23-year-old female with history of autism was transferred from an outside hospital for evaluation of altered mental status. Prior to admission, she had sustained a closed-head injury with negative CT of her head, so a diagnosis of post-concussive syndrome was initially entertained. The patient was at her reported baseline: minimally interactive and not following commands. Her neurologic exam was non-focal; infectious, metabolic/endocrine workup for AMS was unremarkable. A few days later, she developed waxy flexibility, posturing, staring, and catalepsy. She was evaluated by Neurology and Psychiatry specialists, both suspecting a diagnosis of catatonia. She was challenged with lorazepam but became very sedated, so the plan was to eventually pursue elective ECT. The next morning, she was somnolent and diaphoretic and later became febrile to 39.3 C and tachycardic. Despite repeated negative infectious workup, she was empirically covered with broad-spectrum antibiotics. After 24 hours, and with no sign of improvement, she re-spiked a fever and developed diffuse rigidity. A diagnosis of malignant catatonia was made. Patient was transferred to the ICU for aggressive treatment with escalating doses of lorazepam and emergent ECT.

IMPACT/DISCUSSION: Catatonia is a clinical diagnosis suggested by a constellation of abnormal motor responses such as mutism, stupor, waxy flexibility, posturing, staring, echophenomena. Catatonia can vary in severity from non-malignant to malignant; malignant catatonia can occur as a sequela of non-malignant catatonia, or it can manifest on its own. Malignant catatonia presents with fever, AMS, dysautonomia and rigidity. Given the overlapping features of malignant catatonia with other conditions, such as neuroleptic malignant syndrome and sepsis, a high level of suspicion is required. In this case, key findings were the patient's diffuse muscle rigidity, diaphoresis and tachycardia and her second episode of fever while on antibiotics. Unquestionably, her pre-existing catatonia expedited the diagnosis, which was important given the lethality of malignant catatonia if not diagnosed and managed timely. ECT and escalating doses of BZs are the standards of care for malignant catatonia. Urgent management in an ICU setting is recommended given the autonomic instability and the potential of respiratory compromise with BZs warranting intubation for airway protection. This case gave me insight into the spectrum of catatonia, and given the possible progression of the non-malignant catatonia to the life-threatening malignant catatonia, I realized that a new diagnosis of catatonia should prompt daily surveillance for signs of malignant catatonia.

CONCLUSION: -Monitor patients with new-onset catatonia for signs of fever, dysautonomia and rigidity. -Malignant catatonia warrants immediate transfer to the ICU for escalating doses of BZs.

WHAT THE NECK IS THAT? EVALUATION OF A NECK MASS IN AN IMMUNOCOMPROMISED PATIENT

Shirin Hemmat¹; Katherine Julian². ¹University of California, San Francisco, San Francisco, CA; ²UCSF, San Francisco, CA. (Control ID #3176190)

LEARNING OBJECTIVE #1: Develop a differential diagnosis for a neck mass in an immunocompromised patient

LEARNING OBJECTIVE #2: Evaluate and treat drug-induced thrombocytopenia in the outpatient setting

CASE: A 60 year-old woman with a history of renal transplantation presented with a three-week history of enlarging, painful bilateral neck masses. Her past medical history was significant for chronic ureteral reflux resulting in renal transplantation two years prior, maintained on tacrolimus, mycophenolate and prednisone. Her family history was unremarkable. The patient was housed and originally from the Philippines but immigrated to the US more than twenty years ago. Review of systems was negative for fever or chills. Her vital signs were all within normal limits. Her exam was notable for a 3cm firm and tender submandibular mass on the left and a 3cm firm and tender mandibular mass on the right. The remainder of her exam was unremarkable. Labs were normal. An ultrasound of the neck was concerning for undrained abscesses. The patient was hospitalized and underwent a fine-needle aspiration biopsy which was positive for Mycobacterium Tuberculosis (TB). She was ruled out for active pulmonary TB. She was diagnosed with scrofula (tuberculous lymphadenitis of the cervical lymph nodes) and discharged on rifabutin, isoniazid, pyrazinamide, vitamin B6 and ethambutol (RIPE). Six weeks after initiation of RIPE, the patient platelets decreased from 298k to 124k within one week. Her rifabutin was stopped and two weeks later her platelet count returned to 240k.

IMPACT/DISCUSSION: A neck mass likely represents a lymph node, thyroid nodule, congenital or vascular malformation or dermatologic process. Lymph node enlargement can be caused by malignancy, infection or autoimmune diseases. Immunocompromised patients have greater susceptibility to infections. Infections that result in cervical lymphadenopathy include bacterial (Staph Aureus, Bartonella, TB), viral infections (Epstein-Bar Virus, HIV) and endemic fungal infections. Worldwide, it is estimated that TB accounts for almost half of the cases of lymphadenopathy. Scrofula is most often diagnosed in young patients with concurrent HIV (with CD4<300) or who are otherwise immunocompromised. Patients are typically afebrile and present with a firm, chronic, non-tender neck mass. Drug-induced thrombocytopenia in the outpatient setting can be caused by antibiotics (particularly Bactrim and rifabutin), NSAIDs, chemotherapy and H2-blockers. Cessation of the offending medication typically resolves the thrombocytopenia in 2-3 weeks.

CONCLUSION: This case demonstrates evaluation of a neck mass in an immunocompromised patient and the management of rifampin induced thrombocytopenia. It highlights the need to consider TB in the differential of lymphadenopathy, particularly in patients who are originally from countries with high TB prevalence or who have a suppressed immune system.

WHAT YOU "C" MAY NOT BE WHAT YOU EXPECT: A CASE OF SCURVY CAUSING PURPURA

Rachel Snyder; Deepa R. Nandiwada; Laura Kosseim. University of Pennsylvania, Philadelphia, PA. (Control ID #3149639)

LEARNING OBJECTIVE #1: Describe the epidemiology of scurvy in the US

LEARNING OBJECTIVE #2: Describe the clinical presentation of scurvy

CASE: A 57 year old woman with history of hypothyroidism, depression and smoking presented with one month of left lower extremity swelling, ecchymosis, purpura and worsening joint pain. Physical exam revealed no teeth and diffuse perifollicular purpura. Her left leg was edematous and tender. She first presented to another hospital and got antibiotics for concern of cellulitis but they were quickly stopped. Abnormal admission labs were hemoglobin 9.4g/dL (MCV 91) that dropped to 7.2g/dL after fluids given for orthostasis, sodium 132mmol/L and potassium 3.0mmol/L. Rheumatology was consulted for concern of vasculitis. She was empirically started on steroids but showed no improvement so they were stopped. Rheumatology lab panel was unremarkable except Anti-Nuclear Antibody (1:160), CRP (58mg/L) and ESR (36mm/hr). Lower extremity doppler ultrasound showed no deep vein thrombosis. Left lower extremity MRI revealed diffuse edema consistent with nonspecific myositis. Skin biopsy showed subcutaneous lipophages and hemorrhage but no vasculitis. Other work up included Ferritin 160ng/mL, Iron 26ug/dL, TIBC 142ug/dL, B12 182pg/mL, folate 1.3ng/dL, negative fecal occult blood test. Bone marrow biopsy showed reactive marrow but no malignancy. CT chest/abdomen/pelvis showed no bleeding. She was transferred to our hospital for second opinion of the purpura. Upon further questioning, she endorsed two years of chronic diarrhea that limited her diet to meat and cheese sandwiches and coffee. We reviewed her Vitamin C level after this clinical history was obtained; it was undetectable. Given her dietary history, physical exam and nutrition labs, we diagnosed scurvy. She was discharged home with oral vitamin C.

IMPACT/DISCUSSION: This case highlights the value of a thorough initial history and showcases an often forgotten cause of purpura. The diagnosis was delayed for a month after an extensive workup was done due to an anchoring bias and misconception about the epidemiology of scurvy.

CONCLUSION: Scurvy is a disease of Vitamin C deficiency. It is often thought of as a historic disease or one localized to developing countries. However, age adjusted prevalence is 7.1% in USA. Risk factors are smoking, restrictive diets, older age, mental illness, alcoholism, low socioeconomic status and malabsorption. Humans must obtain Vitamin C from the diet. Stores are quickly exhausted after months if not replenished. Vitamin C is essential for collagen synthesis. Common clinical manifestations are therefore secondary to inadequate collagen leading to impaired blood vessel integrity such as perifollicular hemorrhage, gingivitis, ecchymosis and poor wound healing. Late manifestations are edema, bone pain and even death. Treatment is replenishment of Vitamin C. There is no standardized protocol; one can use 100mg to 1g/daily until stores are repleted. Symptoms improve within a few weeks with complete resolution by about 3 months.

WHEN IT'S NOT BIRDS, THINK HOT TUBS!

Adam Dossaji¹; Asad H. Khan². ¹Baystate Medical Center, Springfield, MA; ²Baystate Medical Centre, Broad Brook, CT. (Control ID #3186382)

LEARNING OBJECTIVE #1: Recognize hot tubs as a cause of hypersensitivity pneumonitis

LEARNING OBJECTIVE #2: Recognize the importance of history in eliciting the cause of hypersensitivity pneumonitis

CASE: A 57 year old female with a past medical history of breast cancer presented with shortness of breath to the emergency department. Two weeks prior, she had a history of dry cough, rhinorrhea, sore throat and malaise which was treated with azithromycin and inhaled steroids followed by Amoxicillin-Clavulanic Acid as an outpatient. CXR showed bilateral infiltrates suggestive of multifocal pneumonia and patient was started on Vancomycin and Zosyn. On hospital day 2, she developed hypoxia and hypotension requiring high flow nasal cannula and intravenous fluids. Due to concern for lack of clinical

improvement, CT Chest was ordered and revealed bilateral ground glass opacities in the setting of positive rhinovirus. A bronchoscopy was performed with bronchial lavage (BAL) and transbronchial biopsy showing interstitial inflammation and Type 2 pneumocyte hyperplasia. Preliminary cultures were negative. Further discussion with patient revealed history of exposure to birdcages at home prompting evaluation for hypersensitivity pneumonitis including hypersensitivity panel which was negative. Patient was started on prednisone with dramatic improvement and she was discharged home. After discharge final BAL cultures grew Mycobacterium Avium and at follow up patient was improved but still endorsing symptoms of coughing and shortness of breath. Continued discussion revealed that patient had a home hot tub which she was repeatedly exposed to in the months prior to presentation. She was advised to strictly avoid this in order to prevent relapse of her pneumonitis. At next follow up patient had complete recovery with repeat CT chest showing complete resolution of bilateral opacities.

IMPACT/DISCUSSION: Hypersensitivity pneumonitis (HP) describes a complex condition in which pulmonary parenchyma has an immune reaction to an inhaled substance, often organic in nature. The most common forms are farmer's lung and bird fancier's lung, but the list of causes is vast. It is often characterized by an initial history of cough, weight loss, crackles and wheezing. Worsening of symptoms after exposure to a specific trigger is a hallmark of this disease. The mainstay of treatment is antigen avoidance, often with complete resolution of symptoms with avoidance of antigen, this makes identifying the cause vital. This case highlights the importance of eliciting a detailed holistic history covering all aspects of the patient's life, in conjunction with the clinician having a low index of suspicion and wide net for causes in mind.

CONCLUSION: Thorough exposure history taking is vital to eliciting cause of HP. Complete avoidance of causative exposure is required for total recovery

WHEN PERMETHRIN ISN'T A PERMANENT FIX: CONSIDERING IVERMECTIN FOR TREATMENT OF SCABIES IN THE HOMELESS POPULATION

Alyse Wheelock¹; Samantha Rawlins-Pilgrim¹; Jessica Taylor². ¹Boston University Medical Center, Boston, MA; ²Boston University/Boston Medical Center, Boston, MA. (Control ID #3183543)

LEARNING OBJECTIVE #1: Evaluate treatment options for scabies and their relative effectiveness

LEARNING OBJECTIVE #2: Apply psychosocial considerations to scabies treatment selection

CASE: A 35-year-old woman with a history of AIDS, homelessness, bipolar disorder, and alcohol and cocaine use disorders presented with an intensely pruritic, papular rash. The patient had a recent CD4 count of 173 cells/ μ L and an undetectable viral load, with intermittent periods of non-adherence to her antiretroviral regimen. She had faced housing insecurity for many years and was presently living on the streets with her partner. She was seen initially in the Emergency Department for a pruritic rash on the lower extremities and abdomen. She was diagnosed with scabies and prescribed 5% permethrin cream and oral medications to reduce pruritis. She did not apply permethrin according to recommendations. Persistent symptoms prompted another ED visit and a visit to HIV clinic within the next two weeks. In clinic, the rash was thought to be nodular scabies based on appearance and distribution. She was prescribed weight-based ivermectin (200 μ g/kg orally as a single dose and repeated in 2 weeks) given failure of permethrin. She was seen three weeks after her initial ivermectin dose with improvement of the pruritic rash, although the papules were still present. She reported that she did not take her second dose, so a second dose of ivermectin was re-prescribed. When she was next

seen about ten days later, the lesions were scabbed and her severe pruritis had resolved.

IMPACT/DISCUSSION: Homelessness not only increases one's risk of acquiring scabies infection but also poses important barriers to treatment. This patient presented to medical care four times before achieving resolution of scabies. Consideration of housing status should inform scabies treatment decisions and counseling. Topical permethrin 5% cream, applied from neck to toe, is typically considered the first-line treatment for scabies. However, applying the cream correctly and washing off 24 hours later may be untenable for patients who have inconsistent access to showers. If feasible, application of permethrin by clinical staff may facilitate correct use. An alternative treatment is systemic ivermectin, dosed 200ug/kg, using 1-2 doses spaced at least one week apart. Ivermectin treatment has been found to have similar clearance rates to permethrin after two weeks (approximately 67%) with similar rates of adverse events (Rosumeck et al, 2018). In both cases, environmental measures, such as laundry washing and prophylaxis for close contacts, also affect treatment success.

CONCLUSION: Scabies treatment for homeless patients who do not have regular access to showers and laundry can be complicated. Systemic ivermectin should be considered as a first line option for patients who are unable to complete permethrin treatment.

WHEN POLYARTHRITIS TURNS DANGEROUS, DISABLING, AND EVEN DEADLY

Megan Winkelman; Jessica Fuller; Nancy Choi. University of California, San Francisco, San Francisco, CA. (Control ID #3186644)

LEARNING OBJECTIVE #1: Identify Pancreatitis, Panniculitis, and Polyarthritis (PPP) Syndrome from dermatologic, rheumatologic, orthopedic, and radiologic findings.

CASE: A 46 year old woman with a history of fibromyalgia, psychiatric disease, remote alcohol abuse, and chronic relapsing pancreatitis status post sphincterotomy and pancreatic duct stenting was admitted for acute on chronic pain most severe in her ankles. On hospital day two, multiple erythematous, tender nodules appeared on her legs. Her lipase level on admission was 400, which soon normalized. Due to ongoing abdominal pain, the GI team performed an ERCP (consistent with chronic pancreatitis), stent removal, and pancreatic sphincteroplasty. During week two, she developed additional skin nodules and worsened pain and swelling in her ankles, wrists, knees, and feet. Rheumatologic work-up was significant only for a mildly elevated ESR/CRP. Pathology from her wrist nodule showed necrosis and saponification of fatty lobules with surrounding neutrophil-rich infiltrates. An ankle and wrist MRI showed early osteonecrosis and joint effusions. Due to concern for joint infection, Orthopedic Surgery performed an ankle synovial biopsy and aspiration, revealing a large amount of yellow-gray fluid with negative cultures. Ultimately, given biopsy and imaging results in the context of her clinical history, she was diagnosed with PPP Syndrome.

IMPACT/DISCUSSION: PPP Syndrome is an uncommon disease (only 2% to 3% of patients with pancreatic disease develop cutaneous lesions; those that do rarely go on to have arthritic symptoms) but has a high mortality rate of 24%. Tender, inflammatory lobular nodules are often seen on lower limbs, and may drain oily brown fluid which builds up from the necrosis of adipocytes¹. The polyarthritis (also described as periarthritis with bone necrosis) is likely caused by systemic activity of pancreatic enzymes leading to microcirculatory disturbances and fat necrosis². Like others with PPP, our patient remains significantly disabled by pain and weight-bearing difficulty, but will continue to receive supportive measures³.

CONCLUSION: Early recognition of PPP Syndrome is critical for the hospitalist, who may be the provider best equipped to identify key findings from different consultants and create an integrated diagnosis with a management plan for underlying pancreatic disease as well as the sequelae syndromes. 1. García-Romero, Diana, and Francisco Vanaclocha. "Pancreatic Panniculitis." *Dermatologic Clinics*, vol. 26, no. 4, Oct. 2008, pp. 465-470., doi:<https://doi.org/10.1016/j.det.2008.05.009>. 2. WHEN STATINS ATTACK: A CASE OF NECROTIZING AUTOIMMUNE MYOPATHY

Puja Jadav¹; Stephanie C. Shieh^{1, 2}. ¹Saint Louis University School of Medicine, St. Louis, MO; ²VA St. Louis Healthcare System, St. Louis, MO. (Control ID #3145194)

LEARNING OBJECTIVE #1: Recognize that SINAM is a rare, but potential side effect of statin use.

LEARNING OBJECTIVE #2: Identify the main constellation of findings that characterize SINAM.

CASE: Statins are commonly prescribed medications that reduce cardiovascular disease. We present a case of statin-induced necrotizing autoimmune myopathy (SINAM), a recently characterized entity within the well known spectrum of statin myotoxicity. A 58-year-old African American man with a history of cervical spondylosis, diabetes, hyperlipidemia presented with lower extremity swelling and progressive leg weakness following a fall one month prior whereby his legs "gave out". He had been restarted on atorvastatin 1 year prior, which had initially been discontinued for muscle spasms then deemed unrelated. Physical exam was significant for 3+ edema of lower extremities bilaterally to thighs and proximal muscle weakness with strengths of 4/5 in biceps/triceps but 3/5 in hip flexors/extensors. Pertinent workup for his weakness revealed a benign endocrine workup, normal inflammatory markers (ESR 12, CRP 0.26), negative myositis panel, but a positive ANA, greatly elevated muscle markers (Aldolase 66, CK 11,635), and a high titer positivity for Anti-HMG CoA Reductase (>200). MRI femur showed increased signal within proximal posterior and medial muscle groups indicative of compartmental myositis and skeletal muscle biopsies revealed a necrotizing myopathy with a paucity of chronic inflammation. The patient was started on prednisone 50mg daily, all statins added as allergies, and was discharged with close rheumatology follow up. Given his continued falls despite intense physical therapy, mycophenolate and IVIG were added, with improvement in strength and edema, a downtrend of his CK to 400, and the ability to taper off prednisone.

IMPACT/DISCUSSION: The pathogenesis of SINAM is via the marked up-regulation of the hydroxy-3-methylglutaryl-coenzyme A reductase receptor protein (HMGCR) in regenerating muscle cells of susceptible persons when exposed to statins, which then act as autoantigens to induce antibody production. The anti-HMGCR antibody then triggers necrosis and regeneration of muscle fibers, resulting in severe muscle damage that persists even after the discontinuation of the statin. SINAM is characterized by significant proximal muscle weakness, CK levels over 6000 U/L, evidence of muscle-cell necrosis on biopsy with minimal inflammatory infiltrates, and the presence of autoantibodies against HMG- CoA reductase as demonstrated in our patient case. Treatment includes discontinuing the statin, with half of

all patients needing triple therapy consisting of high dose prednisone and two immunosuppressive agents. When recognized and treated, most patients have good outcomes.

CONCLUSION: While inflammatory myopathies are rare, with SINAM having an incidence of 2 out of 100,000 persons on statins, given the large prevalence of statin use, the importance of early recognition and appropriate management of this debilitating condition cannot be under emphasized.

WHEN THE CULTURES DON'T GROW, YOU NEED TB THINKING

Noah Chodos¹; Zachary Merritt¹; Luke Andrea¹; Nikita Agrawal¹; Amit R. Patel². ¹Montefiore Medical Center (Moses & Weiler), New York, NY; ²Montefiore Medical Center, New York, NY. (Control ID #3185554)

LEARNING OBJECTIVE #1: Describe the work-up of sterile pyuria and when to consider genitourinary tuberculosis

LEARNING OBJECTIVE #2: Recognize the incidence of TB in a non-immigrant population

CASE: A 69 year-old man was admitted with 4 months of persistent dysuria after receiving several courses of outpatient antibiotic therapy for a presumed UTI. Serial urinalyses showed sterile pyuria with leukocyte esterase. One month prior to admission, a CT revealed inflammation in his left kidney, ureter, and bladder, and Urology placed a JJ stent which drained purulent urine with negative bacterial culture and no malignant cells. The patient was born and lived in the U.S. and had a recently negative QuantiFERON Gold. Urology was consulted and recommended routine outpatient follow-up. Finally, the team submitted urine for acid fast evaluation which was positive for 1+ AFB on fluorochrome stain. Repeat serum QuantiFERON was positive, and a confirmatory GeneXpert of the patient's urine was positive for Mycobacterium tuberculosis. He was started on appropriate therapy.

IMPACT/DISCUSSION: This patient had a classic presentation of genitourinary tuberculosis despite lacking typical TB risk factors. Extrapulmonary TB is often neglected as a diagnosis in non-immigrant, non-immunocompromised patients without known TB exposure. However, of 9,557 total cases of TB reported in 2015 (most recent CDC data), 3,186 (33%) were in U.S.-born persons. 1,933 (20%) of the total TB cases were extrapulmonary, of which 91 were genitourinary. Of note, on further history this patient's only possible risk factor for TB was a brief period of homelessness many years ago. Other causes in the differential diagnosis for sterile pyuria include many of the common sexually transmitted infections (HSV-2, HPV, gonorrhea, chlamydia, syphilis, mycoplasma, trichomoniasis), urinary stones, interstitial cystitis, and bladder neoplasm. When none of these more readily detectable causes are uncovered, TB and fungal infections should be considered, particularly if systemic symptoms are present. This particular patient actually had 6 months of failure to thrive and a new anemia, making TB a more likely suspect. While urine AFB specificity is high, sensitivity is low for both stain (28.5%) and culture (37.1%). There is a more sensitive, alternative test that is not readily available at many U.S. centers. The GeneXpert has a sensitivity of 94.3% and a specificity of 96.7% for GU TB and can check for TB DNA in multiple fluid types in less than 2 hours, making it a fast and effective test for ruling out active TB.

CONCLUSION: Persistent dysuria or "recurrent UTI" should prompt additional diagnostic consideration beyond bacterial infection. TB should be considered in individuals with classic presentations even if typical risk factors are lacking. The highly sensitive GeneXpert deserves more use and understanding in the U.S. as a more rapid and appropriate method of ruling out active TB.

WHEN THE CURE IS WORSE THAN THE DISEASE

Jasmine Corona; Louisa Holaday, Montefiore Medical Center, Bronx, NY. (Control ID #3184555)

LEARNING OBJECTIVE #1: Recognize amiodarone-induced pulmonary toxicity

LEARNING OBJECTIVE #2: Monitor for evidence of early pulmonary toxicity in patients on amiodarone

CASE: A 61 year old man with heart failure with reduced ejection fraction with a history of ventricular tachycardia managed with an AICD and amiodarone presented with two weeks of progressive cough with clear sputum and decreased exercise tolerance. Temp 101.7F with oxygen saturation of 83% with stable BP and HR. Fine crackles noted in all lung fields, with no notable JVD and trace edema to ankles. WBC was 10.8 k/uL, pro-BNP was elevated but at patient's baseline. Chest xray (CXR) demonstrated bilateral opacities interpreted as multifocal pneumonia. He was treated initially as viral pneumonia versus superimposed bacterial pneumonia, however he did not improve. CT chest was consistent with diffuse pneumonitis and possible amiodarone toxicity, so amiodarone was stopped and systemic corticosteroids begun. However, despite treatment, his respiratory status worsened and he succumbed to the disease. He had not had a CXR or pulmonary function tests (PFTs) in the outpatient setting in more than one year.

IMPACT/DISCUSSION: Heart failure exacerbation and pneumonia are common diagnoses treated by general internists. Amiodarone pulmonary toxicity (APT) has many features common to these diagnoses, and thus is easily misdiagnosed. In 2016, there were nearly 3 million prescriptions written for amiodarone in the United States. The cumulative incidence of APT is estimated at about 5%. It is thus likely that a general internist will encounter APT during their career. However the risk is correlated with daily dosage and cumulative dosage. For those on 400mg or greater incidence is estimated at up to 15%, while it is only 1.5% in patients taking less than 400 mg. The mortality for APT is 10%, but for patients with acute APT who develop ARDS it is as high as 50%. The typical presentation of APT is subacute (weeks-months) progressive shortness of breath associated with nonproductive cough, malaise, with or without fever and pleuritic chest pain and hypoxia. It can also present rapidly as ARDS. With symptoms that may mimic heart failure or pneumonia, APT is easy to overlook. APT is most likely to occur in patients with advanced age, high cumulative dose, dosage of more than 400 mg daily, duration of therapy exceeding two months and prior pulmonary disease. Given the severity of illness and challenge of diagnosis, it is most important to monitor for evidence of APT in advance and stop the drug when indicated. Current guidelines recommend baseline PFTs prior to starting the drug and clinical evaluation, chest x-ray, and PFTs every 3-6 months. Additionally, any new respiratory symptoms should lead to urgent clinical evaluation, CXR, and PFTs.

CONCLUSION: Patients on amiodarone should be monitored closely in the outpatient setting for any signs or symptoms of pulmonary toxicity, and APT should be on the differential for any patient presenting with pulmonary symptoms who is taking amiodarone.

WHEN TRUSTING YOUR GUT GOES WRONG: HOW TO AVOID CLINICAL BIASES

Caitlin D. Couper; Edwin Chen; Emad M. Kahlil. UPMC, Pittsburgh, PA. (Control ID #3180876)

LEARNING OBJECTIVE #1: Recognize clinical reasoning biases that can often occur with commonly seen admissions

LEARNING OBJECTIVE #2: Utilize CT enterography to evaluate small bowel diseases

CASE: 63 year old male with past medical history of hypertension, tobacco use, and chronic back pain on naproxen presenting with painless hematochezia. Physical exam notable for a benign abdomen and rectum without hemorrhoids. Initial vital signs showed systolic pressure in the 90s and tachycardia to the 100s that rapidly responded to fluid resuscitation. Pertinent labs include hemoglobin of 11.5 (baseline 14). Initial CT A/P showed diverticulosis and a transient distal ileal intussusception felt at the time to be clinically insignificant. He underwent enteroscopy which revealed an unremarkable EGD, but a colonoscopy notable for terminal ileal ulceration with erythematous mucosa. In light of this, a repeat CT with dedicated enterography protocol revealed ileocolic intussusception with nodular enhancement suspicious of a mass. Biopsy of the ulceration revealed a poorly differentiated neuroendocrine tumor. Ultimately, it was felt that the neuroendocrine tumor acted as a pathological leadpoint causing recurrent intussusception that manifested clinically as hematochezia. The patient underwent laparoscopic ileocectomy with resolution of his symptoms.

IMPACT/DISCUSSION: This case highlights several clinical reasoning biases that can easily occur when presented with common internal medicine chief complaints and serves as a reminder to evaluate data judiciously. This case also introduces CT enterography as a tool to evaluate and diagnose small bowel diseases.

CONCLUSION: Hematochezia is a common general medicine admission. Etiology in adults is often due to diverticulosis, hemorrhoids, vascular malformations, and colonic malignancies. In this particular case, we committed ascertainment and availability bias by considering only a list of differentials frequently seen on the wards. By anchoring on the diverticular findings of the initial CT and ignoring the intussusception, we committed confirmation bias, which risks premature closure. This case highlights the ease at which one can fall into several clinical reasoning biases in rapid succession. Fortunately, we were able to reevaluate after colonoscopy with CT enterography to identify the pathological lesion, a rare case of intussusception in adults. This serves as a reminder to be judicious when interpreting data. CT enterography is an imaging protocol that can bridge the gap between upper endoscopy and colonoscopy when evaluating gastrointestinal pathologies. Compared to push and capsule endoscopy, enterography is neither limited by reach nor strictures, and allows visualization of extra-luminal areas. It can easily and non-invasively evaluate inflammatory diseases, neoplasms, ischemia, and bleeding in the small bowel. This invaluable diagnostic tool should be in a generalist's repertoire.

WHY AM I STILL SO TIRED?: A CASE OF UNCONTROLLED HYPOTHYROIDISM FROM LACTOSE INTOLERANCE

Katelin Snow; Robin Klein. Emory University School of Medicine, Atlanta, GA. (Control ID #3176203)

LEARNING OBJECTIVE #1: Recognize how malabsorptive syndromes such as lactose intolerance complicate treatment of hypothyroidism.

LEARNING OBJECTIVE #2: Appreciate lactose intolerance as a potential cause of resistance to levothyroxine treatment in hypothyroidism.

CASE: A 38 year old female with a past medical history of hypothyroidism from Hashimoto's thyroiditis presented to the ER with weakness and lethargy for several months. She also reported constipation, generalized weakness, and dry flaking skin. She was diagnosed with hypothyroidism 10 years prior and takes levothyroxine 100 mcg daily. She takes no other

medications and eats a plant based diet as she recently noticed abnormal reactions to certain foods. On exam, she was afebrile with normal vital signs. Her skin was dry and cool, speech was sluggish, and reflexes were decreased. Laboratory workup was remarkable for a TSH of 214. Endocrinology was consulted. Further history revealed she was having bloating and diarrhea with milk products. It was determined that she likely has lactose intolerance. She was discharged on an increased dose of levothyroxine and advised to take her medication with a Lactaid pill. At outpatient follow up 3 months later, her symptoms had resolved and TSH had normalized.

IMPACT/DISCUSSION: Many factors influence the absorption and metabolism of levothyroxine (LT4) including certain foods and many medications. Malabsorptive gastrointestinal disorders, including lactose intolerance, can also inhibit LT4 absorption and complicate treatment in patients with hypothyroidism. Lactose intolerance is a common condition which usually develops in adulthood, causing symptoms such as bloating, flatulence, and diarrhea when lactose is ingested. Most LT4 formulations contain small amounts of lactose. For patients with lactose intolerance, this can inhibit the absorption and metabolism of LT4 into thyroid hormone. In cases of severe lactose intolerance, exposure to the lactose in LT4 can even cause symptoms. In patients not responding appropriately to LT4 therapy, physicians should perform a thorough review of medications, ask how the patient takes the medication, and look for history of or symptoms of malabsorptive disorders. When lactose intolerance is suspected, treatment options include co-administration of LT4 with lactase supplement (such as Lactaid) or switching to a lactose-free LT4 formulation. This should be done along with the removal of lactose containing products from the diet. Typically this allows patients to achieve euthyroidism at normal doses of LT4.

CONCLUSION: Our case illustrates how a malabsorption syndrome may prompt recurrence of symptoms of hypothyroidism. As both lactose intolerance and hypothyroidism are common diseases, physicians need to be cognizant of how the two conditions interact. Lactose intolerance should be considered in patients who appear resistant to LT4 treatment, require increasing LT4 doses or even develop malabsorptive symptoms with LT4 therapy.

WHY CAN'T I BREATHE? A CASE OF PD-L1 INHIBITOR-INDUCED PNEUMONITIS

Jeffrey Fujimoto; Jennifer Jones. UCLA, Los Angeles, CA. (Control ID #3179560)

LEARNING OBJECTIVE #1: Recognize and treat pneumonitis as an adverse side effect of PD-L1 inhibitors

CASE: A 68-year-old man with history of severe COPD and stage IIIB non-small cell-lung cancer (NSCLC) developed acute hypoxic and hypercapnic respiratory failure while receiving his eighth infusion of durvalumab. Forty minutes into infusion, the patient became short of breath and hypoxic to 80%. He required emergent intubation due to respiratory distress. The etiology of his respiratory symptoms was initially unclear. He lacked infectious signs to suggest pneumonia. His clinical presentation was not consistent with anaphylaxis given absence of other characteristic symptoms such as an edematous oropharynx. He reported compliance with all COPD medications and was without significant wheezing on initial exam though general air movement was poor. The patient was started on empiric antibiotics and pulse dose methylprednisolone. He recovered within 24 hours and was extubated. Antibiotics were de-escalated to azithromycin to complete a 5-day course. CT chest showed bilateral centrilobular ground-glass opacities and bronchial wall thickening, consistent with pneumonitis.

The patient continued methylprednisolone for three days and switched to oral prednisone 40 mg for an additional five days with good clinical recovery.

IMPACT/DISCUSSION: Durvalumab is an immune checkpoint inhibitor that targets programmed death ligand 1 (PD-L1) and has recently been approved for use in unresectable NSCLC. Pneumonitis is a well-known side effect with an incidence of 6.3% after initiation. Radiographically, the most commonly observed pattern is cryptogenic organizing pneumonia (COP) characterized by multifocal ground glass opacities (65% of cases) followed by nonspecific interstitial pneumonia (15% of cases). The median time to onset of pneumonitis is 2.6 months with a range of 9 days to 19.2 months. Treatment of PD-L1 associated pneumonitis is based on common terminology criteria for adverse events (CTCAE) guidelines. Treatment of grade 1 (mild) pneumonitis consists of holding immunotherapy and careful clinical observation. Grade 2 (moderate) pneumonitis warrants treatment with oral prednisone and grade 3 or 4 (severe or life-threatening) pneumonitis requires hospitalization and IV methylprednisolone for 5 to 7 days. Prior to initiation of therapy, all patients should undergo high resolution chest CT and be made aware of the symptoms of pneumonitis, especially those with low respiratory reserve, such as our patient. Providers should exercise caution when re-challenging patients after pneumonitis given nearly 25% may experience recurrence. Patients with confirmed pneumonitis should receive regular CT imaging of the chest, at least every 1 to 2 weeks in severe cases, until symptoms improve to grade 1 pneumonitis or resolve.

CONCLUSION: Recognizing pneumonitis early with PD-L1 inhibitor therapy can significantly improve mortality. Steroids are first-line therapy for symptomatic PD-L1-induced pneumonitis.

WHY DO I HAVE CHEST PRESSURE AND LEG PAIN, AGAIN? AN UNUSUAL CASE OF VENOUS THROMBOEMBOLISM

Elise M. Pearson²; Joshua H. Jun¹; Ricardo C. Couso¹; Rachel Vanderberg¹.

¹University of Pittsburgh Medical Center, Pittsburgh, PA; ²University of Pittsburgh School of Medicine, Pittsburgh, PA. (Control ID #3184464)

LEARNING OBJECTIVE #1: Assess for anatomic risk factors contributing to venous thromboembolism (VTE)

CASE: A 43 year-old female with obesity, unprovoked submassive pulmonary embolism (PE) and extensive deep vein thrombosis (DVT) 23 months prior, now on warfarin, presented to the emergency room with one day of non-radiating substernal chest pain and transient posterior left knee pain. The patient was hemodynamically stable with no oxygen requirement. Her international normalized ratio on presentation was 3.2. On exam of the left lower extremity there was tenderness to palpation of the posterior fossa of the knee, 1+ pitting edema, no calf tenderness, and negative Homans sign. Chest computed tomography (CT) demonstrated a new subsegmental PE in the right lower lobe. Lower extremity duplex ultrasound (US) demonstrated a chronic recanalized DVT of the left femoral and external iliac veins with no evidence of new DVT. Extensive hypercoagulable workup was negative. CT of the abdomen and pelvis with venous phase contrast was obtained to evaluate for May-Thurner syndrome (MTS). CT instead revealed a duplicated left-sided inferior vena cava (IVC) joining the left renal vein, traveling retro-aortically to the right-sided IVC. Given her warfarin failure, the patient was transitioned to enoxaparin and discharged home with hematology, pulmonology, and vascular surgery follow up.

IMPACT/DISCUSSION: Risk for VTE is highest with the presence of one or more elements of Virchow's triad: venous stasis, endothelial injury, and hypercoagulability. Often overlooked in the assessment of VTE are

anatomic venous stasis risk factors like varicose veins, MTS and anomalous IVC. Varicose veins affect roughly 23% of American adults. A recent study demonstrated that patients with varicose veins had higher incidence rates for DVT (hazard ratio (HR) 5.3, [95% confidence interval (CI), 5.05-5.56]), and PE (HR 1.73, [95% CI, 1.54-1.94]) compared with the control group. MTS presents with symptoms of pain, swelling, and/or DVTs caused by compression of the common iliac vein by the overlying common iliac artery. Compression occurs most often on the left side, in the 2nd-4th decade of life with a 2:1 female predominance. It is typically diagnosed by duplex US, though CT, magnetic resonance venography or endovascular US may be more sensitive. If DVT is present, therapy involves catheter-directed thrombolysis, stenting, and anticoagulation. Multiple variations of the IVC can occur, related to abnormal persistence or regression of embryonic veins that become the IVC and renal veins. IVC anomalies are typically asymptomatic and found incidentally, however they may be a clinically significant finding in patients with VTE. While data is limited for IVC duplication, definitive treatment for other compressive etiologies of VTE is surgical, thus evaluation by a vascular surgeon should be considered.

CONCLUSION: It is important to consider anatomic risk factors like varicose veins, MTS and anomalous IVCs in patients with VTE as these may impact therapy.

WHY IT IS ESSENTIAL TO THINK TWO MOVES DOWN THE CHESS GAME.

Chenchen Feng; Alexander Katz; Aimee Sutherland; Jeffrey Wiese.

Tulane University School of Medicine, New Orleans, LA. (Control ID #3184449)

LEARNING OBJECTIVE #1: Diagnose methemoglobinemia in the setting of acute decompensated heart failure

LEARNING OBJECTIVE #2: Recognize the association between rasburicase, methemoglobinemia, and G6PD deficiency

CASE: A 64-year-old woman with a history of essential thrombocytosis presented with dyspnea secondary to acute congestive heart failure. She responded well to diuresis and her dyspnea resolved. A peripheral smear revealed thrombocytosis with blasts, raising the concern for acute myeloid leukemia with a blast crisis. A bone marrow biopsy was performed and given the risk for hyper-uricemia secondary to tumor lysis, rasburicase was prescribed. On the second hospital day, she developed refractory hypoxia initially thought to be due to worsening heart failure. This diagnosis was refuted by an arterial blood gas that revealed a PaO₂ of 300 mmHg despite an arterial saturation of 80% which suggested an abnormal hemoglobin. Methemoglobinemia was suspected based upon recent rasburicase exposure. This was confirmed, methylene blue and ascorbic acid were administered. On the following day, there was an acute drop in hemoglobin which was attributed to hemolytic anemia. G6PD deficiency was confirmed as the cause, likely precipitated by the administration of the methylene blue. Attempts were made to establish an exchange transfusion, but her condition deteriorated resulting in a cardiac arrest and death.

IMPACT/DISCUSSION: Patients with myeloproliferative disorders are commonly encountered by the general internist. While oncologists are primarily responsible for the administration of chemotherapy, it is the general interest who is tasked with the vigilance for and management of common side-effects related to this therapy. Tumor lysis is one of the more common complications, especially for patients with a very high tumor burden. Given the frequency with which these patients are admitted to the

hospital, the prophylactic administration of agents such as rasburicase and allopurinol is often done without consideration for potential side effects from these medications. Methemoglobinemia occurs in less than one percent of patients who take rasburicase, and the incidence is the same in patients with G6PD deficiency. The treatment for methemoglobinemia is methylene blue and patients with G6PD deficiency are highly susceptible to acute hemolytic anemia in the setting of methylene blue administration. Exchange transfusion is the only alternative when a patient requires methylene blue for methemoglobinemia but is succumbing to hemolytic anemia secondary to G6PD deficiency.

CONCLUSION: There is an FDA warning to screen populations with high incidences of G6PD deficiencies, prior to treatment with methylene blue. The practical reality, however, is that when methemoglobinemia presents, prompt initiation of therapy is required which precludes time for screening. The only way to prevent this scenario is to be aware of the patient's G6PD status prior to beginning methylene blue therapy.

WIDE PULSE PRESSURE IN A TRAUMA PATIENT: HEMORRHAGIC VERSUS SEPTIC SHOCK.

Kenya Iwase¹; Jintetsu Minami²; Munehisa Atsumi²; Mitsunori Iwase²; hiroki kato². ¹TOYOTA memorial hospital, Toyota city, Japan; ²Toyota Memorial Hospital, Toyota City, Aichi Pref, Japan. (Control ID #3183827)

LEARNING OBJECTIVE #1: Recognize the diagnostic value of pulse pressure to differentiate etiologies of shock.

LEARNING OBJECTIVE #2: Recognize various causes of wide pulse pressure.

CASE: A 63-year-old man was brought in by ambulance after a single-car rollover traffic accident. His medical history included Crohn's disease for 32 years, long-standing diabetes mellitus and end-stage renal disease on dialysis for 4 years. His blood pressure was 97/34 mmHg and heart rate was 121/min. His respiratory rate was 32/min with normal SpO₂ on room air, and his temperature was 39.9°C. Physical examination revealed abdominal tenderness and warm extremities. A whole-body CT scan was performed for suspected hemorrhagic shock, which showed neither fracture nor traumatic organ damage. However, there was a "dirty fat" sign around the mesentery, consistent with bowel inflammation. Importantly, history taking revealed persistent fever with shivering and watery stool lasting for 2 weeks prior to the presentation. His immunosuppressant therapy was recently discontinued due to nontuberculous mycobacterial infection. He was admitted for suspected intra-abdominal infection as well as flare-up of Crohn's disease. The patient was treated with meropenem. The initial sets of blood culture were negative. We started administration of 5-ASA for assumed flare-up of Crohn's disease. On the third day, we performed exploratory laparotomy for suspected bowel perforation and abscess formation noted on follow-up CT scan. Although laparotomy showed adhesions of intestine, neither abscess nor perforation was noted. On the fourth day, the second blood cultures grew *Candida glabrata*. We added Micafungin. However, abdominal pain and bloody stool persisted, which were thought to be due to intestinal ischemia or necrosis secondary to extensive inflammation. Unfortunately, his condition further deteriorated and he passed on the 26th day. By autopsy, dirty ascites retention because of the intestinal inflammation, bleeding and perforation on mucous membranes were detected.

IMPACT/DISCUSSION: The most common etiology of shock in trauma patients is hemorrhagic shock. Most patients with hemorrhagic shock usually have narrow pulse pressure due to peripheral vasoconstriction from intravascular volume depletion and intrinsic catecholamine surge. In

contrast, septic shock leads to wide pulse pressure due to profound vasodilation from cytokine surge. In the present case, the observed wide pulse pressure was an important clue indicating distributive shock. Intestinal flora is disturbed in patients with inflammatory bowel disease. Recently, fungal flora dysbiosis are also reported. Importantly, we should keep in mind that the various causes of wide pulse pressure exist. The representative causes include aortic valve insufficiency, severe anemia, hyperthyroidism, and beriberi heart, so on.

CONCLUSION: In trauma patients with wide pulse pressure, we should consider that the cases may have something to do with septic shock.

WITHOUT NAME DAH

Ian Cormier; Michael P. Smith. University of Nebraska Medical Center, Omaha, NE. (Control ID #3186078)

LEARNING OBJECTIVE #1: Develop an approach to diffuse alveolar hemorrhage (DAH)

LEARNING OBJECTIVE #2: Recognize the presentation of and risk factors for hantavirus

CASE: A 39 year-old woman from Mexico presented with fever and cough for an unspecified duration. Her past medical history was significant for hereditary amyloidosis with cardiac and gastrointestinal involvement. She was febrile and hypotensive. Thrombocytopenia, elevated lactate dehydrogenase, elevated transaminases and a left shift of granulocytes were present. The patient developed acute hypoxic respiratory failure with diffuse pulmonary infiltrates suggestive of adult respiratory distress syndrome (ARDS) and bilateral pleural effusions. CT of the chest revealed severe bilateral pulmonary consolidation and pulmonary edema. She was started on empiric vancomycin, piperacillin-tazobactam, doxycycline and micafungin for atypical pneumonia. Thoracentesis revealed a transudative effusion. The patient's respiratory status worsened despite therapy and a bronchoalveolar lavage (BAL) revealed diffuse alveolar hemorrhage. All cultures and serology were negative. The patient was started on therapy with steroids for suspected pulmonary amyloidosis. The patient's respiratory status gradually improved. Infectious workup all came back negative except for Hantavirus IgM, which was significantly elevated.

IMPACT/DISCUSSION: Hantaviruses are a genus of enveloped viruses within the Bunyaviridae family. The genus is divided into the New World and Old World viruses, with Hantavirus Cardiopulmonary Syndrome caused by the former and Hemorrhagic Fever with Renal Syndrome caused by the latter. In the United States, HCPS is most commonly caused by the Sin Nombre virus (SNV). The majority of reported cases occur in the Southwest, specifically New Mexico, Arizona, and Colorado. All clinically important Hantaviruses are transmitted by aerosolized droplets from urine, feces or saliva of rodents. One of the earliest and most specific laboratory findings in patients with HCPS is thrombocytopenia with a rapid decrease in platelets. A small number of SNV IgM positive / IgG negative samples represent false positive reactivity associated with acute cytomegalovirus or Epstein Barr virus infection. Diffuse alveolar hemorrhage can be divided into infectious and non-infectious causes. Non-infectious causes are the majority of the causes of DAH, however infectious causes must be considered in the appropriate patients due to treatment implications of corticosteroids. DAH secondary to an infectious cause can occur in both immunocompetent and immunocompromised. The most common causes in immunocompetent patients are influenza H1N1, dengue, leptospirosis, malaria, *Staphylococcus aureus*, and HCPS. The differential for diffuse alveolar hemorrhage must remain broad and should include infectious causes in both immunocompromised and immunocompetent patients.

CONCLUSION: It is essential that the general internist recognize HCPS in a patient at risk and initiate appropriate evaluation in all parts of the country

YOU BOOZE, YOU LOSE... SENSATION

Philip Rosenstock. UCLA-Olive View Medical Center, Sylmar, CA. (Control ID #3183745)

LEARNING OBJECTIVE #1: Understand the physical exam and EMG differences between alcoholic neuropathy and thiamine deficiency

CASE: A 55 year old Caucasian woman with a history of chronic alcohol use complicated by cirrhosis (MELD Score 8, Child-Pugh Class A) presented to the ED with bilateral lower extremity weakness and frequent falls over 1 to 2 weeks. Patient denied recent sickness, travel, trauma, or symptoms of dysautonomia. She reported drinking two glasses of wine per day but had a history of heavy alcohol use—one liter of vodka daily for many years. The patient denied other substance abuse. On initial presentation, vital signs were stable. Exam was notable for distal bilateral extremity deficits in proprioception and vibratory sensation. She had diminished reflexes, plus numbness and hyperesthesia in a stocking glove distribution. She was unable to ambulate. Motor strength was mildly reduced against resistance in her arms. The patient was alert and oriented to person, place, time, and situation. Labs notable for a WBC 7.3, Hb 10, PLT 279, MCV 95.5, ESR 76, Mg 1.5, and otherwise normal serum electrolyte levels and renal function. Initial management included normal saline, thiamine, multivitamin, and tramadol. Neurology consultation was obtained. The patient's generalized weakness and neuropathic symptoms improved during the fourth day of hospitalization. Vitamin B6, B12, and folate levels were normal. Rheumatologic serologies were normal. Lumbar puncture did not reveal acute viral or bacterial meningitis. West Nile virus antibody titers were negative. CT head was negative for acute and chronic intracranial pathology. MRI of the thoracic and lumbar spine was without myelopathic disease. Electromyogram (EMG) showed evidence of chronic sensory-predominant polyneuropathy with predominantly axonal features in the lower extremities. There was no evidence of acute neuropathy. The diagnosis of chronic sensory axonal polyneuropathy secondary to alcohol use was made.

IMPACT/DISCUSSION: Alcoholic peripheral neuropathy (PN) is seen in up to 75% of people with chronic alcohol abuse. It is difficult to diagnose in the initial stages, often mistaken for nutritional deficiencies. In the absence of thiamine deficiency, alcoholic neuropathy can be characterized by slowly progressive symptoms, such as sensory impairment, dysesthesia, and pain. Superficial sensation, frequently nociception, becomes impaired. This is in contrast to both superficial and deep sensory impairments, as well as a motor dominant pattern, seen in thiamine deficiency. Diagnosis can be further validated with an EMG study showing reduced nerve conduction velocities and segmental demyelination. The mainstay of treatment is cessation of alcohol use.

CONCLUSION: - The prevalence of alcoholic peripheral neuropathy is directly correlated with lifetime alcohol consumption more than any nutritional deficiency. - Cessation of alcohol consumption is the only means of reversal.

YOU DON'T DIE FROM NAUSEA AND VOMITING, DO YOU?

Zhihang Zhang; Emily Baumert; Erin Goss. Montefiore Medical Center, New York, NY. (Control ID #3181195)

LEARNING OBJECTIVE #1: Recognize the long-term sequelae of polyarteritis nodosa.

CASE: A 33-year-old male with a past history of polyarteritis nodosa presented to the hospital for nausea and vomiting for 5 days without abdominal pain. He was diagnosed with polyarteritis nodosa (PAN) four years ago and imaging revealed multiple aneurysms in the coronary, renal, splenic, and iliac arteries, as well as thrombosis within multiple mesenteric arteries. Treatment with cyclophosphamide and glucocorticoids followed by azathioprine induced remission. Multiple aneurysms were embolized and he was maintained on systemic anticoagulation. On admission, he denied abdominal pain, but had multiple episodes of non-bloody, non-bilious vomiting often provoked by oral intake, with no hematochezia. His symptoms were originally attributed to gastroenteritis. The patient was afebrile with BP of 110/70 and HR of 70s, and routine labs were negative for amylase, lipase, WBC count, and the infectious gastroenteritis panel returned negative. During the admission, his vomiting persisted despite conservative treatment. On hospital day 3, he developed acute epigastric abdominal pain with guarding, but remained normotensive without tachycardia. CT abdomen demonstrated acute rupture of a splenic artery aneurysm with hemoperitoneum. Patient then developed hemorrhagic shock, and despite extensive efforts, was unable to be resuscitated.

IMPACT/DISCUSSION: Polyarteritis nodosa is a systemic necrotizing vasculitis of medium sized vessels. Most cases are idiopathic, though some are associated with Hepatitis B/C, and hairy cell leukemia. The pathogenesis of PAN is poorly understood, where inflammation leads to thickening of vessel walls that cause luminal narrowing leading to tissue ischemia, as well as weakening of the walls leading to aneurysm formation. 5-year survival rates of PAN are ~80% with treatment. The French Vasculitis Study Group derived a prognostic tool that identifies risk factors associated with higher mortality including age >65, cardiac symptoms, gastrointestinal involvement, and renal insufficiency ($\text{Cr} > 1.7 \text{ mg/dL}$). Patients with PAN require regular long-term follow up to monitor disease activity, even after remission. Major causes of death include renal failure and mesenteric, cardiac, or cerebral infarction. Disease recurrence rates are lower compared to other vasculitides but still substantial; 9% at 1 year and 24% at 5 years in one study. In addition, complications of PAN can occur when the disease is clinically inactive as the healing of inflamed vessels can narrow lumens leading to ischemia. Follow up with angiography is indicated if there is concern for recurrence, ischemia, or aneurysms that are at risk for expansion or rupture. Ligation or embolization is recommended for any aneurysm presenting with symptoms or $>= 2\text{cm}$ in diameter. Symptoms of splenic artery aneurysm include nausea, vague abdominal discomfort, or rarely acute rupture (5%).

CONCLUSION: PAN requires long term follow up for complications and recurrence.

YOU MUST REMEMBER THIS: WHEN A CYST IS NOT JUST A CYST

Jason Ehrlich; Priyanka Chopra. Northwell, Great Neck, NY. (Control ID #3186246)

LEARNING OBJECTIVE #1: Develop the ability to diagnose an often overlooked disorder

LEARNING OBJECTIVE #2: Identify clinical scenarios in which presentation indicates a need to investigate associated systemic conditions

CASE: Patient is a 57 year old man with polyarthralgias who presents with fairly rapid onset of a left ear mass. The mass began appearing 1 month prior to presentation, and occupied a large aspect of the upper pinna. The mass seemed fluid-filled and produced a throbbing sensation. Upon consultation with Dermatology, the mass was initially regarded as an inflamed epidermoid cyst, and was treated with intralesional corticosteroids. The lesion briefly

stabilized, but soon resumed its growth. Consultation with Surgery was undertaken. By this point, the soft but tense collection spanned the superior aspect of the upper auricle, obliterating the antihelix. Needle aspiration did not resolve the process. Rapid reaccumulation led to operative evacuation of the mass. Pathology of the excised material demonstrated helical cartilage damage and surrounding exuberant vascularized granulation tissue with histiocytic infiltration, suggestive of chondrodermatitis nodularis helicis.

IMPACT/DISCUSSION: Often the presenting lesion is first regarded as nothing more than a generic cyst in an awkward location. When it grows aggressively, however, it can obliterate underlying tissue and can additionally represent a first sign of an underlying systemic condition. Cartilaginous inflammation is central to the disease process, at times resulting in cartilage necrosis. The etiology may include trauma, frostbite, or repetitive pressure which compromises the local circulation. The pathophysiology may relate to arteriolar narrowing in the perichondrium of the pinna at sites furthest removed from arterial blood supply - the antihelix and the helix - as reported by Upile in 2009. Cribier in 2006 found neural hyperplasia present in the lesions, perhaps explaining the notable pain produced even upon light pressure. Two-thirds of patients with the disorder are men, and most commonly it arises in the sixth decade of life, as in our patient. The condition may also be associated, however, with collagen vascular disease, particularly systemic sclerosis, as first identified by Bottomley and Goodfield in 1994, and explored further by Magro in subsequent years. Any case emerging from a patient outside the most typical demographic should be further investigated for links with possible autoimmune disease. Treatment may be undertaken with pressure-relief strategies, intralesional corticosteroids, laser ablation, or surgery. Recurrence may still approach 30%.

CONCLUSION: Chondrodermatitis nodularis helicis is a condition which internists would do well to identify, as its course may be aggressive just as well as it may be indolent. Connecting a patient expeditiously with treatment may reduce the risk of disfigurement. Its association with autoimmune disorders must be recognized, as this benign-appearing cystic mass may lead to discovery of an active systemic condition.

ZOLPIDEM INDUCED SYNDROME OF INAPPROPRIATE ANTIDIURETIC HORMONE

Ayah A. Megahed¹; Lenar Latypov²; Sami Rabah¹; Nour Boulad¹. ¹Lincoln Medical and Mental Health care Centre, New York, NY; ²Lincoln Medical and Mental Health Center, New York, NY. (Control ID #3165623)

LEARNING OBJECTIVE #1: To diagnose hyponatremia secondary to Zolpidem intake, especially in elderly population

CASE: The patient is a 70 year old male with PMH of HTN, DM, CAD s/p CABG, CVA secondary to left vertebral artery dissection, BPH and seizure disorder. He presented with abdominal pain of 3 weeks duration, increasing over the last 3 days. He took 30 pills of Zolpidem over 3 days in an attempt to treat the pain. CT of the abdomen was performed showing calicular gall bladder with chronic atherosclerosis of the coeliac and superior mesenteric trunks. During further evaluation, the patient was found to be severely hyponatremic (Na 116) but asymptomatic. Serum glucose and creatinine were normal. Laboratory work up showed: (Na 116, serum osmolality 242; urine osmolality 400; urine Na 64) with normal TSH and cortisol level, consistent with SIADH. The patient has a past medical history of seizure disorder that has been managed with Carbamazepine for many years. Carbamazepine is known to cause SIADH as a side effect, yet he did not have any sodium abnormalities in the past. Therefore, we assumed that this recent hyponatremia was due to ingestion of high dose of Zolpidem. He was initially given NS at a rate of 75 cc/hr then 150 cc/hr with a breakthrough seizure in

between. The patient was managed with strict fluid restriction and administered Na tablets with eventual elevation of the Na from 116 to 130. On final assessment, the patient was asymptomatic without any new complaints.

IMPACT/DISCUSSION: Hyponatremia is common among the elderly, and may be caused by physiological changes, pathologic processes or drugs. About half of elderly patients with hyponatremia have features typical of the syndrome of inappropriate antidiuretic hormone secretion (SIADH). The symptoms depend on the degree of hyponatremia and the rapidity with which the syndrome develops and may include anorexia, nausea, vomiting, headache, diarrhea, weakness, lethargy, confusion, convulsions and coma. The number of medications that have been reported to cause SIADH is increasing and currently include vasopressin and its analogues, thiazide diuretics, chlorpropamide, carbamazepine, antipsychotics, antidepressants and nonsteroidal anti-inflammatory drugs. Also, few cases of Zolpidem induced SIADH were reported in the literature. Drug-induced SIADH usually is treated by withdrawing the suspect drug and restricting fluid intake

CONCLUSION: It is important to carefully monitor serum sodium in patients receiving Zolpidem. It should be avoided in the elderly population who are more prone to hyponatremia

INNOVATION IN HEALTHCARE DELIVERY (IHD)

"THREE STEPS FORWARD, TWO STEPS BACK": A QUEST FOR JOY IN RESIDENT PRACTICE THROUGH AMBULATORY INTERPROFESSIONAL TRANSFORMATION

Jennifer Verbsky¹; Daniel J. Coletti¹; Frank Cacace²; Nancy A. LaVine³; Jason Ehrlich⁴; Nissa Mazzola⁵; Joseph Conigliaro⁶. ¹Northwell Health, Plainview, NY; ²northwell health, Great Neck, NY; ³Northwell Health, New Hyde Park, NY; ⁴Northwell, Great Neck, NY; ⁵St. John, Queens, NY; ⁶North Shore LIJ Health System, New Hyde Park, NY. (Control ID #3185705)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can transformation of a large internal medicine resident ambulatory practice into an interprofessional, teamlet-based structure enhance resident ambulatory experiences and thus promote retention in primary care careers?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Increase frequency of interprofessional interactions in a large resident practice through use of team huddles 2. Improve satisfaction with resident ambulatory training by providing residents with enhanced interprofessional support 3. Augment resident interest in primary care careers

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Our internal medicine residency program has 108 categorical residents rotating through one of 2 ambulatory sites in a 4+1 block schedule. In one ambulatory site (housing 2 clinics), 10 residents work in the HRSA grant-funded IMPACCT (Improving Patient Access, Care, and Cost through Training) clinic, along with pharmacy, psychology, physician assistant, and medical students in a cohesive interprofessional (IP) team. The IMPACCT clinic has served as our innovation lab for IP practice, where workflows are tested prior to implementation in our other clinics. Based on experiences of the IMPACCT clinic with huddles and co-located staff, we transformed the larger 60 resident clinic to 1) dedicate and co-locate 3 medical assistants (MOAs) alongside residents in the same conference room, 2) group residents, faculty, pharmacy students, and MOAs into smaller "teamlets", and 3) introduce huddles prior to each patient care session.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO

EVALUATE PROGRAM/INTERVENTION: Residents complete an anonymous battery of questionnaires at the end of the academic year to evaluate their ambulatory training. The battery includes the IP Socialization and Valuing Scale (ISVS), the Primary Care Attitudes Scale (PCAS), and other questions assessing IP interactions, perceptions of the training site and workflows, and interest in primary care.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): During the 2017-18 assessment period, we observed a significant improvement in the frequency of interactions between residents and pharmacists ($p=.006$), MOAs ($p=.03$), our health psychologist ($p=.004$), and our care management staff ($p=.004$). Residents were also more likely to participate in team meetings or huddles ($p<.001$). However, we observed no increase in positive attitudes towards primary care careers. Content analysis of open-ended responses suggested that inefficient workflows and an excess of administrative tasks were key reasons for dissatisfaction with the ambulatory experience despite IP transformation.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): We hoped that more regular support from IP team members would lead to a better clinic experience and increased primary care interest. While we found that residents did in fact better appreciate working within an IP team, that alone was not sufficient to improve their overall clinic experience as the volume of administrative tasks was not eased or redistributed. Our next steps will target this feedback and aim to provide additional resident support through task triage strategies, sharing of tasks with MOAs and nurses, and protected task completion time.

A CLINIC RUN COMMUNITY GARDEN THAT SERVES PATIENTS LIVING IN FOOD DESERTS

Carolyn F. Pedley¹; Robert Jones⁴; James L. Wofford²; Elizabeth Gamble¹; Peter R. Lichstein³; John C. Moskop¹; Robert L. Rominger⁴; Claudia L. Campos⁵; Ramon Velez⁴; Melanie Martin⁶; Feben Girma⁷; Monica T. Brown⁴; Kirsten Feiereisel⁸; Nancy M. Denizard-Thompson⁸; Deepak Palakshappa³; Robert Bloomfield⁹. ¹Wake Forest, Winston-Salem, NC; ²Wake Forest School of Medicine, Winston-Salem, NC; ³wake Forest School of Medicine, Winston Salem, NC; ⁴Wake Forest Baptist Health, Winston-Salem, NC; ⁵Wake Forest University, Winston-Salem, NC; ⁶Wake Forest, Greensboro, NC; ⁷Wake Forest Baptist Medical Center, Winston-Salem, NC; ⁸Wake Forest University School of Medicine, Winston-Salem, NC; ⁹Evergreen Internal Medicine, Winston-Salem, NC. (Control ID #3184420)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Many patients who attend an urban, academic affiliated clinic reside in food deserts, lacking in access to fresh fruits and vegetables.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To establish a community garden next to the clinic to supply patients with fresh fruits and vegetables 2. To involve patients, medical residents, medical students, physicians, nurses and other clinic members in the operations of the garden 3. To distribute the produce to clinic patients and to educate them on the value of eating fresh fruits and vegetables

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): An abandoned lot next to the medical clinic located in downtown Winston-Salem was transformed into a community garden which is comprised of 30 raised beds. After consultation with master gardeners and the local agricultural extension agency, volunteers were taught "hands on" techniques of organic gardening. Nearby grade schools and nurseries provided the garden with

plants and seeds. Charitable donations were processed by a church partner and a community development organization provided funds to buy tools and supplies. The medical center donated an irrigation system and the fence surrounding the garden. In 2016 the garden received an award for its community outreach and the award funds were used to purchase a storage building. Volunteers included medical students and residents, clinic physicians, nurses and other personnel, local volunteer groups, garden clubs, scout troops, student service groups, a local temple and church, patients and residents of the neighborhood. Volunteers met at the garden 2-3 hours Saturday mornings March - Nov. to plant, weed, fertilize and harvest. Produce was weighed at each session and distributed to the clinic patients the following week. **MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION):** The success of the garden was measured by the following metrics: 1. Total produce distributed to patients 2. Numbers of volunteers 3. Numbers of patient/ provider interactions in the distribution of produce in the clinic

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 1. The garden yields of the past three years are as follows: 2016 -1400 pounds 2017- 1500 pounds 2018- 1485 pounds Produce- tomatoes, green beans, squash, okra, kale, lettuce, carrots, beets, cabbage, watermelon, blueberries, strawberries, onions, cucumbers, potatoes, collards, pumpkins, peas, beets, chard, peppers and eggplant. 2. Each growing season had more than 100 volunteers; most volunteered on multiple occasions 3. Assuming that patients received an average of 2 8 oz bags of produce, there were approximately 3000 opportunities to interact with patients while handing out produce in the clinic each growing season.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A community garden in association with a medical clinic serves as way to supply much needed fruits and vegetables to an underserved patient population. In addition, volunteers benefit from working together, enjoying "green" physical activity and addressing the common goals of taking care of plants and bringing the produce to their patients. In an informal manner there was exchange of growing techniques, recipes and passing nutritional information on to patients.

A GROUP VISIT MODEL FOR CHRONIC PAIN PATIENTS ON CHRONIC OPIOIDS

Matthew J. Townsend²; Barbara Ogur^{1, 3}. ¹Harvard Medical School, Cambridge, MA; ²Harvard Medical School, Boston, MA; ³Center for Primary Care, Harvard Medical School, Boston, MA. (Control ID #3180199)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): New protocols for managing patients with chronic pain on chronic opioid therapy propose tapering off opioids, however clinical experience has shown this to be difficult.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To assess patients on long-term opioids for chronic pain for opioid use disorder (OUD). To assess a program of individualized assessment for OUD and individualized treatment plans coupled with group support. To assist patients to taper opioids or transition to buprenorphine.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We expanded a program of monthly group visits for chronic pain patients on chronic opioid therapy to include individualized assessments for opioid use disorder and treatment plans based on these assessments. 23 patients

completed at least 18 months of the program. Group visits consisted of 1 hour of group support and exploration of alternative modalities for controlling pain, mindfulness meditation and principles of cognitive behavioral therapy. Each patient was evaluated for opioid use disorder, using DSM 5 criteria. Patients with criteria for OUD who did not wish to taper were encouraged to switch to buprenorphine therapy. A non-randomized group of chronic pain patients who were not referred to the program was analyzed to compare outcomes.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Patients in the pain groups were monitored for depression, anxiety, level of pain, and level of function. Opioid doses and transition to buprenorphine were tracked. Compliance with guidelines for management was monitored and compared with chronic pain patients on opioid not participating in the group.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 13/23 patients in the chronic pain group met criteria for opioid use disorder (9 mild, 3 moderate, 1 severe). 5 of these patients were successfully transitioned to buprenorphine with patients reporting improvement in mental function and levels of anxiety. No comparison group patients transitioned to suboxone. Identical percentages of patients in group attendees and in the comparison patients tapered off opioids (30%), decreased their MED (35%), remained constant (17%), or increased their dose (17%). All 3 measures of quality care were better delivered in the group setting (provider visit every 3 months, urine drugs screen every 6 months, completion of a controlled substance agreement). Pain group patients' pain, depression, and anxiety scores did not change during group participation. Patients expressed high levels of satisfaction in the group setting, with 14/16 respondents extremely or very satisfied with the groups.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A group visit format is well received by patients on chronic opioids for chronic pain and simplifies the provision of appropriate processes of care. It facilitates the diagnosis of opioid use disorder and transitioning of appropriate patients to buprenorphine.

A HEALTHCARE SYSTEM'S COORDINATED APPROACH TO PATIENTS ON CHRONIC OPIOIDS

Joel Sawady^{3, 6}; Emily Benedetto¹; Gina Stenhouse²; David Roll¹; Emily Hanson³; Aaronson Y. Chew⁴; Randi Sokol⁵; Barbara Ogur⁶; Ellie Grossman¹; Janice F. Kauffman². ¹Cambridge Health Alliance, Somerville, MA; ²Cambridge Health Alliance, Cambridge, MA; ³Cambridge Health Alliance, Brighton, MA; ⁴Cambridge Health Alliance/Harvard Medical School, Somerville, MA; ⁵Cambridge Health Alliance, Malden, MA; ⁶Harvard Medical School, Cambridge, MA. (Control ID #3185600)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): A multidisciplinary, coordinated approach is needed to design and implement treatment programs for patients with chronic pain

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Develop multidisciplinary expertise in the treatment of chronic pain, including long-term opioid therapy, in an academic safety-net healthcare system 2. Design and implement a primary-care-based program that supports providers and patients in safe and evidence-based treatment of chronic pain

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Cambridge Health Alliance (CHA) is a safety-net academic health system

with 13 outpatient primary-care practices serving 120,000 patients, with integrated behavioral health (BH) staff at all sites. We brought together a multidisciplinary task force of primary care providers, BH and addiction specialists, and a clinical pharmacist to focus on developing a chronic pain program. We performed a needs assessment by:

- Reviewing evidence-based chronic pain treatment modalities, including their availability in our community
- Assessing the extent of opioid prescribing in our system
- Speaking with providers and patients about their needs
- We piloted interventions at several sites, including:
- Improved workflows to support compliance with guidelines and regulations
- Pharmacist-led medication management
- Enhanced mental health supports
- Group visits
- Multidisciplinary review of complex patients

We are now in the process of spreading these interventions across all 13 sites, with attention to educating clinical staff on the biopsychosocial model of chronic pain and leveraging existing integrated BH staff.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Each pilot site monitors measures specific to their intervention. System-wide, we monitor rates of utilization of controlled substance agreements, urine drug screens, and brief functional assessments.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Bringing together a multidisciplinary team has allowed us to deploy a systemwide program, building on primary care's strengths in patient-relationship-building and motivational enhancement, while folding in cognitive-behavioral strategies taken from the psychology world and made feasible for use in primary care. System-wide, we have seen increases in the rate of controlled substance agreements and urine drug screens. Pilot interventions have shown:

- Reduction in high-dose opioid prescribing, and in benzodiazepine co-prescribing, in the pilot of workflow supports
- Stable-to-improving functional status among patients undergoing opioid tapers in the pharmacist-led intervention
- High patient satisfaction, and improvement on multiple quality measures, in the group visits
- High provider satisfaction with multidisciplinary case reviews

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Creation of a multidisciplinary task force has been instrumental in improving patient care and increasing provider support. Our team's focus on revising processes of care, educating providers, supporting the development of local expertise, and providing new venues of treatment and consultation services has helped shape a more comprehensive, integrated, and evidence-based community of practice around chronic pain management.

A MULTIDISCIPLINARY TEAM APPROACH FOR PHARMACOLOGIC TREATMENT OF ALCOHOL USE DISORDER AT HOSPITAL DISCHARGE

Shirin Hemmat²; Joseph Clement¹; Erica Bass²; Rand Dadasovich²; Margaret Gray²; Michael Incze²; Nadine Pardee²; Michael A. Thomashow²; Marlene Martin². ¹Zuckerberg San Francisco General Hospital, San Francisco, CA; ²University of California, San Francisco, San Francisco, CA. (Control ID #3185647)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Alcohol use disorder (AUD) affects up to 12% of the population and contributes billions of dollars in societal costs, but the use of pharmacotherapy for treatment of AUD is underutilized, particularly at hospital discharge.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Increase the total number of prescriptions for AUD treatment at discharge for patients who are diagnosed with AUD. A

secondary objective was to educate patients, physicians, nurses and pharmacists about AUD pharmacotherapy.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): At our safety net hospital, 28% of hospitalized patients have a substance use disorder. AUD accounts for 54% of these disorders. Furthermore, AUD is among the top 5 diagnoses with the highest 30-day readmission rates (18.9%) in our hospital. Despite this prevalence, for our inpatient resident-led Internal Medicine teams, only 10 patients per month were receiving prescriptions for treatment of AUD at discharge; reaching less than half of eligible and interested patients already being screened by nurses on the Alcohol and Tobacco Treatment Team (ATTT). The ATTT is an existing nursing-led team that aims to advise physicians on the need for pharmacotherapy for patients with active alcohol and tobacco use disorders. In response to an institution-wide quality improvement incentive program, a team of Internal Medicine residents, nurse leader and a faculty hospitalist partnered with the ATTT to increase the number of patients with AUD who were prescribed medication assisted treatment (MAT) at discharge. We collaborated on an algorithm to expand pharmacologic options available for MAT beyond our institution's previous naltrexone-only approach. Educational interventions included monthly addiction medicine didactics and widely disseminated educational materials. We also shadowed the ATTT nurses and obtained their input on how to better integrate resident and ATTT workflow. We also provided biweekly updates to housestaff on the number of prescriptions for AUD treatment stratified by medical team to foster healthy competition. Residents will receive a small financial incentive if a pre-specified target of 15 patients per month is discharged with a prescription for AUD treatment six out of twelve months of the year.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Our primary measure was the number of patients discharged with a prescription for treatment of AUD at hospital discharge.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Two months after the initiation of our project, the number of patients discharged from our resident-led Internal Medicine service with a prescription for treatment of AUD has increased from average of 10 to 19 patients per month. Findings from subsequent months will be incorporated.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A multidisciplinary partnership to improve AUD treatment can effectively increase prescribing of pharmacotherapy two months after implementation in a safety-net urban hospital. Key interventions included an educational campaign, working with the ATTT to expand MAT for AUD and incentivizing resident physicians to prescribe medication for treatment of AUD among patients eligible and interested in treatment.

A NEW DISCHARGE INSTRUCTION TEMPLATE: IMPROVING SAFE DISCHARGES ON THE CLEVELAND CLINIC INTERNAL MEDICINE TEACHING SERVICES

Megan A. McGervey¹; Jessica Donato². ¹Cleveland Clinic Foundation, Lakewood, OH; ²Cleveland Clinic, Beachwood, OH. (Control ID #3186336)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Decreasing hospital readmissions has been a major focus nationally and locally over recent years. Multiple strategies within the discharge process have been shown to impact readmission rates with a cumulative effect. The

discharge instructions utilize templates and thus provide an opportunity to embed multiple evidence-based components into standard practice. We sought to improve the safety of hospital discharges and reduce readmission rates by developing a novel discharge instruction template on the general medicine teaching services, which hardwires multiple safe discharge practices.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Objectives of the intervention were to identify components of safe discharges that could be improved on teaching services, create a new discharge instruction template that hardwires components with low metrics, and improve safe discharges, patient/physician communication, and reduce readmissions to the hospital.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A Quality Improvement (QI) project to improve the quality of discharges from the internal medicine teaching services was undertaken starting September 2017 at a large academic medical center. Current state was assessed by reviewing discharges from four teaching service teams and collecting surveys from 48 Internal Medicine senior second and third year residents. Prior to our intervention, residents failed to comply with several components of a safe discharge including confirming the patient's primary care provider (PCP), performing medication reconciliations, follow up information after discharge, and providing patients with customized instructions for their aftercare. A new discharge instruction template was created, requiring residents to confirm the patient's PCP, make follow-up appointments, create customized bulleted instructions, and provide patients with specific anticipatory guidance and instructions on who to contact after discharge.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Process measures included PCP confirmation, creation documentation of follow-up appointments, inclusion of customized bulleted instructions and documentation of specific anticipatory guidance in the discharge instructions. Readmission rates are being collected as an outcome measure.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Forty-one discharges on the general medicine teaching service over one week were studied prior to the intervention. The discharge summary template has been rolled out to four teaching services over the course of this nine-month project with variable compliance from medicine trainees. After the intervention, PCP confirmation increased from 71% to 100%, follow-up appointments from 20% to 83%, detailed discharge anticipatory guidance from <10% to 100% and bulleted discharge instructions from 58.8% to 100%, and detailed discharge anticipatory guidance from <10% to 100%.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): By hardwiring several components of a safe discharge into the discharge template that were frequently overlooked by residents previously, we have improved safe discharges showing that these changes can be successfully implemented based on needs at other facilities.

A NEW VISION FOR DIABETIC RETINOPATHY: FACILITATING SCREENINGS USING OPHTHALMOLOGY ECONSULTS

Kim Dowdell^{3, 1}; Samuel Collins¹; Arjun Dirghangi²; Kerry N. Cotter¹; Ira Helenius³. ¹University of Virginia, Charlottesville, VA; ²UVA, Charlottesville, VA; ³University of Virginia, Charlottesville, VA. (Control ID #3185134)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

A barrier exists to patient access to diabetic retinopathy screenings, stemming from ophthalmology clinic volume, patient access barriers, and resources in the primary care clinic.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES):

1. Provide primary care clinics with the resources to complete diabetic retinopathy screenings (e.g. equipment, software, staff training, and potential reimbursements)
2. Improve the percentage of eligible diabetic patients being screened for diabetic retinopathy
3. Improve interprofessional communication and care coordination between primary care and specialty care

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

Diabetic retinopathy is the most common cause of blindness in the United States for patients ages 20-74. All patients with diabetes should have a yearly eye exam, but many patients find it difficult to see an ophthalmologist regularly. This is particularly true at our pilot site, University Medical Associates (UMA), which has a high proportion of uninsured, unscreened patients with diabetes. In response to these challenges, the Center for Telehealth and Department of Ophthalmology implemented the Diabetic Retinopathy Screening (DRS) Program. By utilizing the eConsults service, we are implementing the second iteration of this program with new technology and workflow to build a more efficient, sustainable, and scalable screening program. In the U.S, there is a general consensus that the most cost-effective setting for performing retinopathy screenings is at the initial point of care in the PCP clinic. The DRS Program has placed a Remidio camera at UMA, which is the world's first and only smartphone-based, non-mydriatic fundus camera with infrared imaging capabilities. This device comes with an application to facilitate capture, report generation, and storage of the images and is an ideal platform for comprehensive telemedicine enabled eye screening, as it enables images to be synced and archived securely in the cloud for remote review and clinical management.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION):

-Percentage of eligible diabetics who receive annual diabetic retinopathy screening

-Turnaround time of image review and interpretation

-Percentage of abnormal findings

-Increasing the acuity within referral patterns

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED):

In our first iteration of the DRS Program at UMA, we found the following (plain text or graph due to submission formatting): Year # of diabetic retinopathy screens % of diabetic patients screened

| | | |
|------|-----|-------|
| 2011 | 236 | 6.1% |
| 2012 | 552 | 14.2% |
| 2013 | 603 | 15.5% |
| 2014 | 472 | 12.1% |
| 2015 | 219 | 5.6% |
| 2016 | 255 | 6.5% |
| 2017 | 320 | 8.2% |

~40% of screens had abnormal findings and required a follow-up visit to the ophthalmology clinic.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?):

- Consider staffing realities of the primary care clinic
- When choosing a device, consider facility limitations
- Implement automated scheduling workflow for positive screenings
- Ensure that image quality meets the parameters for national standards of diabetic retinopathy screening.
- An early primary care champion is critical
- Pay careful consideration to outside grant and funding opportunities
- Consider emerging capability of artificial intelligence to make diagnoses

A NEW WAY TO USE YOUR ABCS: IMPROVING OUTPATIENT FOLLOW-UP AFTER HOSPITAL DISCHARGE.

Evan Siau; Alejandro Arbelaez; Raghav Aggarwal; Paula Dibo; Rezaul

Hoque; Monica Mauri; Shorabh Sharma; rajan gurunathan. SBH Health System, Norwood, NJ. (Control ID #3162490)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Developing tools to facilitate post-acute care follow-up is a key element in enhancing linkage with primary care services and improving ambulatory outcomes.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES):

To improve effective follow-up after hospital discharge and positively affect linkage with primary care, we set forth to design and implement a scripted educational tool, to standardize the physician approach to scheduling post-hospital discharge care in a user-friendly way.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

A literature review was conducted to identify best practices and focus groups were engaged. Key elements of care were identified, including identifying where patients have established care, where they would like to follow, the timeframe they needed to be seen, and whether access with the type of doctor or service needed was established as priority. Based on literature review, best practice analysis, and focus group inputs, a scripted educational tool was developed. The "ABC's of Scheduling Post- Discharge Care. A-ASK: Where is your usual source of care? Where do you want to be seen? Resident Clinic / FQHC / Community Provider / Faculty Practice B- BY WHEN: When does the patient first need to be seen by post-discharge? < 1 wk / < 2 wks / < 4 wks C - COORDINATE: Are the scheduled appointments relevant and coordinated? Is first appointment appropriate (time / place)? Baseline information was reviewed for quality improvement purposes on 88 discharges across 3 selected medical units. 3 PDSA cycles were then conducted over 12 weeks, during which physician champions were engaged, staff were trained using the tool when planning hospital discharge, and selected quality improvement metrics were followed in real-time on the same sample size in order to assess the potential impact of the tool.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION):

The % of patients accurately assigned to their preferred source of care post-hospital discharge. The % of 'first post-discharge visits' specifically relevant to the patient's hospitalized condition. The % of no shows for post-hospital discharge visits in our primary resident clinic. The median number of days to first scheduled appointment post-hospital discharge.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED):

When compared with discharges from the selected units pre-intervention, discharges from the selected units post-intervention showed: The % of patients accurately assigned to their preferred source of care increased from 85% to 92%. The % of 'first post-discharge visits' specifically relevant to the patient's hospitalized condition increased from 68% to 83%. The post-hospital discharge no show-rate in our primary resident clinic decreased from 81% to 64%. The median number of days to first scheduled appointment decreased from 15 days to 10.5 days.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?):

Based on our experience, implementation of a scripted educational checklist or tool has significant opportunity to help minimize variability in scheduling of post-hospital discharge visits, enhance access to post-acute care services, and improve patient outcomes within the ambulatory setting.

A PHARMACIST-DRIVEN POPULATION HEALTH INITIATIVE TO IMPROVE THE QUALITY OF HYPERTENSION MANAGEMENT IN A GENERAL INTERNAL MEDICINE CLINIC

Jennifer Sabatino; Shengyi Mao. The Ohio State University, Columbus, OH. (Control ID #3186608)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Globally, hypertension is the number one cause of death and disability which underscores the importance of controlling this modifiable risk factor to reduce cardiovascular mortality in primary care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To assess utility of pharmacist co-management of hypertension in improving blood pressure control (defined as blood pressure <140/90) for patients with a diagnosis of hypertension in a primary care clinic.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A pharmacist flagged charts of patients on the daily clinic schedule with a diagnosis of hypertension whose last office blood pressure was 140/90. Front desk staff notified the pharmacist when flagged patients arrived and clinical staff notified the pharmacist if the flagged patients had a blood pressure that was still 140/90 on rooming. The pharmacist met with these patients real-time to recheck blood pressures, review medications, and assess adherence. If the pharmacist was not able to meet with the patient during their visit, they contacted the physician after the visit to request referral for co-management if appropriate. Alternatively, the physician could contact the pharmacist to initiate referral for co-management.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The proportion of adult patients with a diagnosis of hypertension with last office blood pressure <140/90. We also tracked as a secondary measure, the proportion of patients with uncontrolled hypertension with a defined plan for management following their visit.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): From February 2018 through December 2018, a total of 293 patient visits met the criteria for the new workflow. Of these, 87 patients (26.7%) had a blood pressure 140/90 on rooming or were not checked. The pharmacist was in the office for 49 of the uncontrolled visits (56.3%). Of these, the pharmacist was notified by clinic staff for seven patients and completed co-management visits for nine patients. Of the 87 uncontrolled patient visits, 70 (80.5%) had hypertension follow-up documented after the visit. Types of follow-up included pharmacist co-management initiated by the pharmacist (15/87, 17.2%), pharmacist co-management initiated by the physician (31/87, 35.6%), management by the physician alone (18/87, 20.7%), monitoring by nursing staff (4/87, 4.6%), or managed by specialist (2/87, 0.23%). During the study period, 42 patients with uncontrolled hypertension at their initial visit had a subsequent visit. Of these, 33 patients (78.6%) achieved blood pressures <140/90. Overall, the percentage of patients with controlled hypertension increased from 58.4% (380/651) prior to implementation of the new workflow to 70% (480/681) at the end of the study period.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Establishing a workflow to promote referral for pharmacist co-management of hypertension improved blood pressure control rates compared to usual care.

A PROCESS TO IMPROVE CARDIAC TELEMETRY USE IN A COMMUNITY HOSPITAL

sana chams³; jasmeet bal¹; Ankita Aggarwal¹; Manishkumar Patel¹; Gloria J. Hong¹; Vesna Tegeltija¹; Sarwan Kumar². ¹Wayne State University, Auburn Hills, MI; ²Crittenton Hospital/Wayne state university, Rochester, MI; ³wayne state university school of medicine, Auburn Hills, MI. (Control ID #3184688)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Inpatient telemetry monitoring is commonly used to identify arrhythmias, QT prolongation, and ischemia. However, it has been noticed that telemetry is being utilized inappropriately which leads to increased health care cost for the patient in addition to alarm fatigue for the health care professionals.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. The primary aim of our project was to explore the reasons for unnecessary telemetry use during hospitalization 2. The secondary aim was to decrease inappropriate telemetry use.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A project team was formed to assess whether telemetry is utilized appropriately amongst patients admitted to our community hospital. The fishbone diagram was used to explore the reasons for inappropriate telemetry use.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We used the Institute of Healthcare Improvement [IHI] model to guide this study. PDSA(plan, do, study, act) cycles were used to assess the intervention by comparing pre and post-intervention data.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): PDSA 1: During root cause analysis, a fishbone diagram was utilized to uncover the culprits of inappropriate telemetry use. It was discovered that an order for telemetry can be placed without selecting an indication. We targeted this system problem by creating a list of class I, II and III indications, in line with ACC/AHA guidelines, and integrated it into the EMR(electronic medical records). A post-implementation review revealed no improvement in adherence due to the physician's ability to bypass this checklist. PDSA 2: In the second cycle, a lack of knowledge about indications for telemetry was found as another culprit contributing to unnecessary use. An educational session about indications of telemetry was conducted for internal medicine residents and they were instructed to document it in their note. Post-intervention data revealed that in 30% of cases, the residents documented an indication for telemetry. Furthermore, chart review revealed that none of the residents discontinued telemetry during the hospitalization despite negative alarms. PDSA 3: A review of 50 charts of patients admitted to the medical floor with telemetry revealed that 60% of patients had no appropriate indication for telemetry continuation after 72 hours. A pop-up was integrated into the EMR that appears 72 hours after initiation of telemetry guiding physician to either renew telemetry by choosing an indication or to discontinue telemetry if not indicated. A post-implementation review revealed that 34% of telemetry use was addressed by either renewing telemetry order or by discontinuing it. Only 10% telemetry was discontinued through the pop-up as physicians were able to bypass it.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our project has been successful in bringing attention to overuse of telemetry and physicians are now required to select indications for telemetry when placing an order. However, once an indication is selected,

the patients continue to remain on the telemetry monitor throughout their hospitalization. Next phase of the project will focus on improving appropriate discontinuation of telemetry.

A STREAMLINED PATHWAY FOR COMMUNITY-ACQUIRED PNEUMONIA WITH RAPID CONVERSION TO ORAL THERAPY IMPROVES HEALTHCARE VALUE

Claire Ciarkowski¹; Emily S. Spivak²; Tristan Timbrook⁴; Matthew Sanford³; Christy Hopkins⁵; Nathan Hatton¹; Frank O. Thomas³. ¹University of Utah, Salt Lake, UT; ²University of Utah School of Medicine, Salt Lake City, UT; ³University of Utah Hospitals and Clinics, Murray, UT; ⁴University of Utah, SALT LAKE CITY, UT; ⁵University of Utah, Salt Lake City, UT. (Control ID #3171437)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): How does the Initiation of a Clinical Care Pathway for Community Acquired Pneumonia (CAP) Effect Antibiotic administration and Hospital Costs?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Develop and execute a standardized electronic health record (EHR) "best practice" pathway for the treatment of CAP. Implement a stewardship team to reinforce best practices. Determine how these interventions impact intravenous antibiotic administration, hospital length of stay (LOS), and costs for patients admitted to a medical floor.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A standardized CAP order set for patients presenting to the emergency department (ED) was developed by a multidisciplinary team. A best practice alert (BPA) is triggered when orders for a chest radiograph and an antibiotic are placed. The BPA asks for confirmation of antibiotic use for pneumonia and if confirmed an order set is provided. The order set offers guidance on appropriate triage, diagnostic testing, risk assessment for drug resistant pathogens and antibiotic selection. Patients admitted to medical floors are given a single intravenous (IV) antibiotic dose, followed by automatic switch to oral antibiotics for a total duration of 5 days. Atypical coverage with azithromycin is discontinued after 24 hours unless *Legionella* urine antigen returns positive. Pre-implementation training and education was provided to providers, nurses, respiratory therapists and pharmacists. The antimicrobial stewardship team performed prospective audit of patients on medicine floors and provided feedback on appropriate diagnostic testing and antibiotic use for patients with CAP.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The primary endpoints were LOS, days of IV antibiotic therapy, and relative mean cost adjusted for CURB65, age and Charlson comorbidity index using interrupted time series analysis. Secondary endpoints were mortality and 30 day readmission.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The pre-implementation period was 9/1/2016 to 8/31/2017 and included 409 patients on acute medicine floors and MICU. Implementation date was 9/1/2017 followed by a one-month run in period for pathway education. The post-implementation period was 10/1/2017 to 8/31/2018 and included 457 patients. The preliminary data showed our intervention was associated with a 39% (95% confidence interval (CI): 2% to 62%, p= 0.04) reduction in monthly per visit costs. There was a non-significant reduction in both LOS (-1.8 days, 95% CI: -4.03 to 0.42,

p =0.10) and IV antibiotic duration (-0.88 days, 95% CI: -2.05 to 0.28, p=0.18). There were no significant changes in 30-day readmission or mortality. Further analysis will be conducted.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The implementation of an EHR driven CAP care pathway in the ED supplemented by education and antimicrobial stewardship review appears to improve healthcare value by reducing costs. Our preliminary data suggests our efforts may not have been sustainable, possibly related to new providers and limited stewardship program resources, however further analysis is required.

ADDRESSING LOW RECEIPT OF LIFESAVING MEDICATIONS FOR OPIOID USE DISORDERS IN MINORITY POPULATIONS: IS ENGAGEMENT IN PRIMARY CARE THROUGH PEER RECOVERY COACHING THE ANSWER?

Ricardo Cruz¹; Mayowa T. Sanusi¹; Rafik Wahbi¹; Alissa Cruz¹; Michele Clark³; Daniel Hostetler³; Molly Higgins-Biddle³; Daniel P. Alford². ¹Boston Medical Center, Boston, MA; ²Boston University School of Medicine and Boston Medical Center, Boston, MA; ³JSI, Boston, MA. (Control ID #3185834)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Despite known mortality benefit through receipt of medications for opioid use disorders (MOUD), minority populations (Black & Latino) are less likely to be engaged and retained in MOUD after completing detox and continue to experience high rates of opioid related mortality.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Peer Recovery Coaches (PRC) deliver interventions to individuals with OUD completing detox assisting them to: 1. Link to primary care and identify, manage and prevent OUD comorbidities such as HIV, hepatitis B and C, and mental illness; 2. Engage in primary care to facilitate receipt of MOUD for a minimum of 6 months; and 3. Receive overdose education and naloxone (OEND).

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Partnering with two addiction treatment programs offering detox services that serve minority populations in Boston, Project RECOVER (Referral, Engagement, Case management, and Overdose preVention Education in Recovery) uses two PRCs who are culturally diverse and in recovery from substance use disorders to support patients through the processes of post-detox linkage, engagement and retention in primary care in order to receive MOUD for up to six months. Through the use of "Recovery Wellness Plans" PRCs prioritize domains of social determinants of health that patients feel are important to their recovery.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): To determine the degree of linkage, engagement and retention in MOUD and primary care post-detox as a means of decreasing both fatal and non-fatal opioid overdoses, compared to a comparison group from the MA Chapter 55 Opiate Overdose data.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Preliminary findings after three months of implementation are: 52 patients with OUD (54% male, 54% were Black and/or Latino/Hispanic) completing detox were enrolled. Of the enrolled patients 67% have a history of incarceration, 51% self-reported Hepatitis C infection,

86% are homeless or with transient housing. Average educational attainment of the participants was high school diploma/GED. The average number of prior overdoses in this group was 7 episodes. Forty-seven patients attempted OUD treatment an average 1.74 times prior to enrollment. Additionally, 46% had an appointment scheduled for primary care, 71% have had phone or in person contact with the PRC post-detox, and 75% have received OEND. Of the 31 patients with one-month data, no overdoses have been reported.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Using culturally diverse PRCs is a feasible and promising model to link and engage minority patients with OUD to lifesaving medications and primary care and has potential to decrease opioid-related overdose deaths in this population.

ADDRESSING MISSED SCREENING OPPORTUNITIES THROUGH A TEAM HUDDLE IN A RESIDENT PRIMARY CARE PRACTICE

Neha S. Paralkar¹; Yuriy Khanin¹; Belinda Lee¹; Nancy A. LaVine²; Jennifer Verbsky²; Joseph Conigliaro²; Eun Ji Kim². ¹Northwell Health, Manhasset, NY; ²Northwell Hofstra School of Medicine, Lake Success, NY. (Control ID #3144472)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can the use of a pre-visit huddle in a resident ambulatory practice improve preventive care screening rates?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Identify eligible patients with missed screening opportunities for hepatitis C, osteoporosis, and colorectal cancer (CRC) during daily pre-visit preparation 2. Improve screening rates for hepatitis C, osteoporosis, and CRC by discussing individual gaps in care during a team pre-visit huddle

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Our two resident ambulatory practices are located in a large academic medical center and are certified Patient Centered Medical Homes comprised of 108 internal medicine residents rotating on an n+1 schedule, nurses, case managers, pharmacists, medical assistants, and other allied health professionals. Pre-visit huddles have been implemented to allow the interprofessional team to prepare for each patient visit. In our intervention, prior to the daily huddle, one medicine resident performed daily chart reviews to identify patients with gaps in care for appropriate screening tests, including screening for hepatitis C, osteoporosis, and CRC. The resident then reviewed those patients with the entire interprofessional team during the huddle to ensure the intervention was addressed during the visit.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We evaluated three quality improvement projects utilizing the huddle to identify patients with needed preventive care measures: hepatitis C screening, osteoporosis screening, and CRC. Screening measures were performed based on current USPSTF guidelines. Pre and post intervention screening rates for eligible patients were measured for each of the projects (Hepatitis C screening, osteoporosis screening, and CRC screening) and the percent change was calculated.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): For eligible patients, the hepatitis C screening rate improved from 66.0% pre-intervention to 75.8% post-intervention (9.8% increase). The osteoporosis screening rate improved from

36.3% pre-intervention to 41.8% post-intervention (5.5% increase). The CRC screening rate improved from 36.2% pre-intervention to 43.2% post-intervention (7.0% increase).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Huddles are brief daily interprofessional meetings to improve communication between staff members, enhance accountability and empowerment, and collaborate on plans for improved patient care. Pre-visit preparation to identify individual gaps in care can be easily incorporated into huddle discussions and can successfully improve screening rates by identifying eligible patients for the entire interprofessional team.

ADDRESSING OBESITY AND MOOD THROUGH A NOVEL PRIMARY CARE-BASED LIFESTYLE MANAGEMENT PROGRAM IN A SAFETY NET PRACTICE

Melissa Mroz. University of Rochester, Rochester, NY. (Control ID #3184938)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Evidence has shown that lifestyle interventions effectively reduce weight and improve mood; however, barriers to recommending lifestyle interventions include a lack of clinician knowledge and confidence in treating obesity and availability of affordable programs.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Program objectives included: 1. To provide an affordable, on-site lifestyle management program for primary care patients with obesity 2. To enhance provider confidence in treating obesity 3. To improve patient outcomes, as measured by weight reduction and mood improvement

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Lifestyle Management Group (LMG) intervention was offered to patients with obesity in Strong Internal Medicine (SIM). SIM is a safety net, faculty-resident internal medicine practice at the University of Rochester, providing primary care to approximately 12,000 patients. The LMG held bi-weekly sessions over 24 weeks. Each session included a provider visit that focused on goal-setting and comorbidities, followed by group exercise and education. Education topics spanned topics including diet, activity, stress and sleep. Participating staff included providers, nursing, social work and nutrition. The LMG was designed to be revenue neutral provided there were at least 10 patients.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Several metrics were used to assess the program's objectives: - 50% of SIM physicians will refer 1 or more patients - 25% of referred patients will attend 1 or more sessions and 20% will attend 2 or more sessions - Weight reduction (% body weight) and improvements in mood (PHQ-9, GAD-7) for patients attending 2 or more sessions

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Initial results are promising. In terms of endorsement, 55% of physicians referred at least one patient to the LMG. Of 60 total referrals over 6 months, 31 patients were scheduled to attend an LMG session. Of these, 18 attended at least 1 session and 12 attended 2 or more. For patients who attended 2 or more sessions, 9 experienced a decrease in weight, 2 lost 5% or more of their body weight and 6 showed improvements in mood. The second LMG is ongoing and collecting additional outcome measures, including pain and physical function.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Several key lessons warrant highlighting. First, convening a multidisciplinary team was critical to the program's success in light of its duration and scope. Aligning staff interests and skills with sessions maximized program participation and engagement. Support by practice leadership was also needed to block time for staff to facilitate sessions. Second, screening revealed that several patients had food insecurity, limited mobility, and lacked access to safe, outdoor activities. These findings underscore the importance of screening and tailoring activities to patient needs. Last, the engagement of community-based resources and use of curated online exercise videos were vital to meeting patient needs and providing an affordable program. Future work will focus on improving provider skill in motivational interviewing to increase utilization of LMG and community-based resources.

ADDRESSING SOCIAL DETERMINANTS OF HEALTH THROUGH IMPLEMENTATION OF A COMPREHENSIVE SOCIAL NEEDS SCREENING AND REFERRAL PROGRAM

Jane Lindahl²; Rachael Odusanya²; Omolara T. Uwemedimo¹; Johanna Martinez²; Shari Jardine¹; Eun Ji Kim². ¹Northwell Health, New Hyde Park, NY;

²Northwell Hofstra School of Medicine, Lake Success, NY. (Control ID #3179076)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Social determinants of health (SDH) affect more than half of patient health outcomes, but few programs exist to comprehensively screen for SDH and provide resources for addressing unmet needs.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) To identify and address unmet social needs of patients at primary care clinics in a large, suburban, academic hospital system. 2) To evaluate whether SDH screening, navigation, and referral can address social needs in vulnerable populations 3) To work towards integrating a standardized, health-system wide program for SDH screening into primary care practices

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Our health system's SDH Screening Program was established to identify and address adverse SDH in our primary care populations. The program runs at two ambulatory care practices which serve as academic clinical sites for a large teaching hospital serving a primarily low-income, diverse population, many of whom are immigrants. Our program uses a Patient Navigator (PN) model embedded in the clinical workflow to universally screen patients for SDH during well-visits using a screening tool to assess unmet social needs including housing, food, education and utility insecurity, among others. PNs are trained in promoting patient engagement and cultural competency. They conduct SDH screening in the waiting room, provide referrals to connect patients with SDH needs to community resources, and conduct bi-monthly follow-ups to address their needs over the course of 12-weeks.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We evaluate the program using the following measures: screening rate, screen completion rate, percent of patients with unmet needs who connect with a PN, percent of patients with unmet needs who are connected to resources, and percent of patients whose needs are resolved within 12 weeks of screening. We examined these measures at an Internal Medicine clinic from July to December 2018.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 764 patients were screened, of which 326 (42%) screened positive for social needs. Among those with needs, 152 (47%) accepted initial assistance from PNs and 81(25%) were successfully connected to resources.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This program model has demonstrated the importance of engaging clinical staff and PNs at each site in order to embed the SDH screening process within the clinical workflow. Further, screening comprehensively for social needs and using a PN model to address those needs through individualized community resource referrals facilitates patient trust and engagement. Prioritizing cultural competency through the recruitment of bilingual navigators, the use of translated screens and interpreter services, and a training program for PNs emphasizing skills for working with diverse, vulnerable populations have also been vital to our success. The program provides streamlined referrals to trusted partners by partnering with local community organizations and establishing a Medical-Legal Partnership allowing for in-house referrals to free legal assistance for patients with health-harming legal needs.

ADDRESSING SOCIAL DETERMINANTS OF HEALTH: CONNECTING DISADVANTAGED PRIMARY CARE PATIENTS TO UNITED WAY COMMUNITY RESOURCE NAVIGATION

Shari Bolen^{1, 2}; Jonathan Lever³; Samantha Smith⁴; David Bar-Shain⁵; Elvira Ordillas⁶; Wanda Ali-Matlock³; Joseph DaPrano¹; Matthew Finley⁷. ¹MetroHealth/Case Western Reserve University, Cleveland, OH; ²Case Western Reserve University, Cleveland, OH; ³Better Health Partnership, Cleveland, OH; ⁴Cuyahoga County Board of Health, Parma, OH; ⁵The MetroHealth System, Cleveland, OH; ⁶MetroHealth Medical Center, Cleveland, OH; ⁷United Way of Greater Cleveland, Cleveland, OH. (Control ID #3185363)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Although disadvantaged patients often have social needs, few programs have implemented and evaluated connecting these patients electronically to a community organization with community resource navigation. We describe early results of a pilot clinic-to-community linkage program addressing social determinants of health for hypertensive adults with uncontrolled blood pressure seen in a safety net clinic.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Determine social determinant of health needs of disadvantaged patients within a safety net clinic; 2) develop a scalable model to address social determinants of health which could be implemented across multiple electronic health record systems and U.S. communities; 3) apply the model to hypertensive adults with uncontrolled blood pressure.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Hypertensive adult patients with elevated blood pressure ($BP \geq 140/90$ mmHg) seen at a safety net clinic in Cleveland, Ohio were referred electronically to United Way 2-1-1 (a non-profit organization which curates a database of >20,000 health and social service community resources) with the goal of connecting the patients to health-improving community resources in a 1-month pilot period (9/24/2018 and 10/28/2018).

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Our measures of success thus far include: 1) types of needs addressed; and 2) uptake of referrals to community organizations to address identified needs.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In the 1-month pilot period, 51 hypertensive patients were eligible for referral to United Way 2-1-1 and 25 (49%) consented to a referral. The two main reasons identified for lack of referral were patient refusal and inconsistencies among staff offering the referrals. Of the 25 referred, 15 patients were reached by the 2-1-1 navigation specialist, 4 patients were still being contacted, and 6 were unreachable. Reached patients reported 67 total needs which fell into 11 distinct categories according to the national 2-1-1 taxonomy: food/meals (n=11 patients), health care (n=11), recreation (n=9), utility assistance (n=4), housing (n=2), individual, family, and community support (n=2), income assistance (n=2), information services (n=1), transportation (n=1), clothing/personal/household needs (n=1), and volunteers/donations (n=1). The median number of needs per patient was 4 (range 1-8). A total of 124 referrals to community resources were provided to patients by the navigation specialist to address identified needs, with an average of 8 referrals (SD 4) per patient. Of the 5 patients with follow-up to date, each had either one need resolved or a resolution in progress. These preliminary findings will be updated in May; we anticipate a sample of at least 100 patients, with more extensive follow-up data.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Patients reported an extensive set of needs with the majority related to food insecurity, health education, physical fitness opportunities, and utility assistance. Successful strategies such as electronic referrals to a national United Way 2-1-1 service could be a model which is scaled up across the U.S. to better address social determinants of health.

ADDRESSING SOCIAL DETERMINANTS OF HEALTH: DEVELOPING AND DELIVERING TIMELY, ACTIONABLE AUDIT FEEDBACK REPORTS TO HEALTHCARE TEAMS

Harriet Fisher¹; Jeffrey Wilhite¹; Lisa Altshuler¹; Kathleen Hanley¹; Khemraj Hardowar¹; Letisha Smith¹; Sondra Zabar¹; Isaac Holmes¹; Andrew B. Wallach^{1, 2}; Colleen C. Gillespie¹. ¹NYU School of Medicine, New York, NY; ²Bellevue Hospital, New York, NY. (Control ID #3185394)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Does actionable feedback on patient safety indicators and responses to disclosed social determinants of health (SDoH) impact clinical behavior?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): (1) Develop/ disseminate quarterly audit-feedback reports on SDoH practice behavior, focusing on elicitation of patient information. (2) Enhance our understanding of factors related to disparities in safety/ quality of care. (3) Increase rates of SDoH documentation and referral.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We sent Unannounced Standardized Patients (USPs) with SDoH-related needs to care teams in two urban, safety-net clinics. Data collected on practice behaviors were used for cycles of audit and feedback on the quality of electronic health record (EHR) documentation, team level information sharing, and appropriate service referral. Reports contained an evolving educational component (e.g. how to recognize, refer, and document SDoH). We disseminated

reports to teams (doctors, nurses, physician's assistants, medical assistants, and staff) at routine meetings and via email.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Three audit feedback reports have been distributed to date. Survey data was collected at two time points, 2017 (n=77) and 2018 (n=81), to assess provider attitude changes and integration of feedback into clinical practice. Measures included change in team knowledge and attitudes towards SDoH, and response to/ documentation of presented SDoH (measured via post-visit checklist and EMR).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Preliminary data shows no change or improvement in documentation of SDoH and limited variation between firm-level responses. (1) Only 7% of providers reported feeling strongly confident in knowing how to make referrals for social needs in 2018; no improvement since 2017. (2) Despite regular report distribution, 58% of providers reported having received no formalized feedback on responding to SDoH. 24% reported maybe or not sure. (3) 86% of 2018 survey participants self-reported having referred a patient to appropriate services when a social need was identified. Our referral data says otherwise, referrals occur for less than 30% of visits with SDoH-related needs.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Results suggest disconnect between team data and individual reporting: most report they refer but data suggests few do. Deeper integration of reports into team processes, attachment of feedback to curricula, and increased frequency of regular feedback may be needed for accountability. These preliminary results help refine audit feedback methodology but research is needed to understand motivation and systems barriers to referral and documentation. Future research will look at provider attitudes toward referral processes.

AN ACADEMIC CONSORTIUM TO SUPPORT RURAL AMERICAN INDIAN HEALTH

Matthew Tobey; Katrina Armstrong. Massachusetts General Hospital, Boston, MA. (Control ID #3185835)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): 5.2 million American Indians and Alaska Native (AIANs) live in the United States, with 3.2 million AIANs belonging to federally recognized tribes. The United States government has a trust relationship to provide healthcare to those 3.2 million AIAN individuals, who experience the lowest life expectancy at birth of any racial or ethnic group. South Dakota is home to nine reservations, including several of the nation's largest reservations by size and population. Despite strong communities and remarkable health innovations, several of these tribes experience the worst health outcomes in the nation. These counties face three of the five lowest life expectancies at birth and the single highest county-level rates of mortality from diabetes, liver disease, alcohol use and road traffic accidents.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Our seven-year objectives have been to 1) demonstrate sustainability and growth of an academic partnership between a distant large academic health system and a rural American Indian community in South Dakota; and 2) promote and coordinate other academic health center partnerships in the region.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): In 2012, our academic health center established a partnership with the Indian Health Service (IHS) and the Rosebud Sioux Tribe. In 2016, a rotating team of internists began to provide 365-day-a-year coverage in the IHS center, providing primary care and inpatient care. In 2018, our team hosted an "accelerator workshop" in collaboration with Harvard's Radcliffe Institute of Advance Study. In addition to inviting members of our partnerships, we invited health systems and community leaders from several South Dakota stakeholder organizations and tribes. We also invited leadership from academic health centers, including those in the regional and others with a national reach. Follow-up discussions and partnership building continues.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We perform ongoing evaluation of our local partnership with metrics including chronic disease management, health center care quality metrics, care innovations projects, and evaluation of IHS and tribal perspectives. We evaluate the academic consortium on feedback of stakeholders, growth of programs, and ability to effect change in three areas of focus.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Our local academic partnership has proven sustainable over three years and has helped facilitate the growth of other academic health system partnership efforts in the region. The IHS center has successfully met accreditation standards and met increasingly numbers of national quality metrics. The academic consortium has identified three priority areas: 1. Health workforce development for local tribes, including youth development 2. Academic partnerships to improve care systems in rural IHS service units 3. Health systems transformation to emulate best-practice models from other regions, e.g. Alaska

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): We have established partnership pathways by which academic health centers may engage meaningfully with AIAN communities that face health equity challenges.

AN ACADEMIC PARTNERSHIP WITH A RURAL TRIBAL JAIL

Matthew Tobey; Rachel E. Simon; Leila H. Borowsky. Massachusetts General Hospital, Boston, MA. (Control ID #3179136)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Individuals who experience incarceration carry among the most substantial health risks of any group, including excessive rates of substance use disorders, serious mental illness and chronic medical illness. American Indian and Alaska Native (AI/AN) individuals experience the lowest life expectancy of any ethnic or racial group in the United States, just over 70, with large land-based tribes experiencing worse outcomes yet. The Indian Health Service (IHS) provides services to 2.2 million of the nation's 5.2 million AI/AN individuals, including those incarcerated in tribal jails. Little information exists on the health of incarcerated AI/AN individuals, with only five papers in the peer-reviewed literature.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Objectives include: -To improve care access for one nation's largest tribal adult correctional facilities -To provide health education to individuals incarcerated at the tribal jail

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Through a clinical services contract with a rural IHS facility, rotating internists from our academic health center team provide year-round clinical care with the IHS in a rural tribal community. Two programs link this program to the local tribal jail: 1. A once-weekly internal medicine clinic in the jail. 2. A student-led health promotion program at the jail in which a team comprised of a mix of PA, NP and MD students teach one-hour health educational sessions to the jail's women's unit followed by the men's unit.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Measures – clinical program 1: Stability of the clinic 2: Number of weekly visits 3: Satisfaction of IHS and tribal jail stakeholders 4: Chronic disease outcomes 5: Transitional care post-release from jail Measures – education program 1. Sustainability of program and participation of trainees 2: Attendance of individuals who are incarcerated at the jail 3. Satisfaction of participants with the sessions

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Both the clinical and educational programs have proven sustainable over two years. 16 patients are seen during the weekly half-day morning clinic. High levels of satisfaction have been expressed by IHS and tribal jail leadership with the clinic. The tribal jail has repeatedly requested additional weekly clinic sessions. Successful care navigation has led to placements at the tribal alcohol inpatient program, the tribal methamphetamine inpatient program, and our team's hepatitis C initiative at the IHS. The health promotion curriculum has become the jail's primary health programming for its population. All 60 trainees over the past 18 months have participated. Students often list participation in the sessions as a highlight of the rotation. Intermittent surveys of jail participants have shown high satisfaction and been used to elicit topics for future weeks. 10 women and 15 men participate on a typical week.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Tribal jails represent an opportunity for the pursuit of health equity and public health agendas. Clinical and non-clinical activities in tribal jails, as described, may strengthen connections between Native health systems and correctional facilities.

AN INTERDISCIPLINARY CLINIC FOR MEDICALLY COMPLEX NEW YORKERS WITHOUT HOMES

Yinan Lan^{3, 2}; Janine Knudsen^{3, 1}; Ann R. Garment^{3, 2}; Andrew D. Goldstein^{3, 2}; Jessica Hughes¹; Anne Marie Young¹; Megan Hosein^{3, 2}; Nicole Hosseiniipour¹; Isaac Holmes³. ¹NYC Health + Hospitals, New York, NY; ²Bellevue Hospital Center, New York, NY; ³New York University School of Medicine, New York, NY. (Control ID #3181578)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): How do we provide effective, dignified primary care for medically complex patients with homelessness in a safety-net health system?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To effectively engage homeless patients with complex barriers to primary care To provide dignified, trauma-informed care focused on patient-oriented care goals while addressing addiction, mental health, and chronic disease To implement an interdisciplinary care team model in a safety-net health care system combining primary care, social work, care coordination, and nursing

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

Unstably housed people with complex chronic disease often receive fragmented care from various emergency departments and inpatient settings, accruing high rates of acute care utilization without improvements in health. Recently, intensive outpatient models have emerged to better manage high need patients. Here we describe our efforts to create a complex care clinic for medically, socially, and behaviorally complex patients with unstable housing at the largest safety-net health system in the United States. Launched in August 2018, the clinic aims to engage patients in a trusting healthcare environment and break the cycle of disease, addiction, and housing instability. Our team includes four buprenorphine-waivered internal medicine physicians, a social worker, care coordinator, and home care nurse provided by our system's Medicaid Health Home. Patients are referred from the ED, inpatient service, other clinics, street outreach organizations, shelters, and jails. They receive extensive care coordination; on-site addiction, medical, and social services; home nursing visits; and collaboration with shelters and community based organizations.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): A quantitative analysis will be used to determine program impact on clinical outcomes and utilization, patient experience, and provider satisfaction. Both quantitative and qualitative measures will be used to evaluate clinic capacity, services provided, patient engagement, and progress towards patient-oriented care goals.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): From August through December 2018, 156 referrals were given appointments and 83 patients completed at least one appointment. Of those, at least 44 patients (53%) returned for a second visit. On average patients completed 2.1 visits. We had a 16% cancellation rate and 38% no show rate. Patients are mostly male, middle-aged and street or shelter dwelling with common diagnosis of substance use disorder, lower extremity wounds, and hypertension. Our most engaged patients (>3 visits, n=15) have seen an average reduction in ED visits by 68% and inpatient admissions by 58% within our system compared to pre-clinic intervention.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Relationships have been a core element of patient care, building an interdisciplinary team, and developing referral and collaborative resources internally and in the community. Our focus on a patient-directed care plan, warm hand-offs, continuity of care, and community outreach has also allowed this model to succeed.

BEDSIDE ROUNDS IMPROVE PATIENT SATISFACTION AND CARE TRANSITIONS

Marwa Mousa¹; Jennifer Renaud¹; Charles Okamura¹; Yvonne Brown¹; Frank Volpicelli². ¹NYU Langone, Staten Island, NY; ²New York University, New York, NY. (Control ID #3184390)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

As the lack of a 'face-to-face' interaction between the full team and the patient led to a downturn in patient experience scores, we were inspired to design a patient centered communication tool that standardizes the multidisciplinary bedside rounds.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To improve our patients' hospital experience in regards to care transitions and discharge planning by

implementing standard bedside rounds that center around the patient's health care needs. 2. To create a daily scheduled opportunity for the patient to be involved in medical decisions and discharge planning which enhances patients' understanding of their own care plan.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

Our medical-surgical units did not have a standardized approach to ensure clear communication from a patient's multidisciplinary team, comprised of physicians, nurses, case managers and social workers. To this end, we implemented a communication plan based on the acronym "WE CARE" 1) Who was present (who was at bedside in addition to the patient); 2) Everyone on same page (language and literacy barriers); 3) Connect with patient and family (promote patient-centeredness and compassionate care through eye contact, introducing the full team); 4) Assessing understanding (explanation of changes to medications, key lab and test results, and post-discharge plans); 5) Response from patient and/or caregivers (ensuring understanding); 6) Educate/ empathy/ end of conversation. Centered on the WE CARE model, we gathered all members of the care team and visited each patient at a standardized time every day. The intervention was started on one medical-surgical, unit 5600 on July 2018.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): HCAPS (Hospital Consumer Assessment of Healthcare Providers and Systems) scores for care transitions and discharge information pre and post intervention will be evaluated for the study group (unit 5600). We will also compare these scores to med/surg units who did not receive the intervention.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We compared our pre-intervention 1/1/2018-4/31/2018 (approximately 54 surveys) and post-intervention (approximately 42 surveys) scores. In the domain of care transitions, e.g., patient had a good understanding of things patient was responsible for in managing his/her health; patient had a good understanding of purpose of each medication; staff consideration of patient and caregiver preferences post-discharge, there was an increase from 28% in our top-box (an answer of always) composite HCAHPS score to 58%. Scores for "discharge information delivered" remained high with a top-box response above 85% both pre- and post-intervention. In addition, during the post-intervention time, the study group unit had the highest "care transition" and "discharge information" top box responses compared to all control units.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A focused, structured communication tool WE CARE, implemented as a part of daily standardized multidisciplinary bedside rounds led to an improvement in patient satisfaction scores around care transitions and discharge information delivered.

BEYOND THE WALLS OF THE CLINIC: A TELEMEDICINE PILOT TO ENHANCE CARE DELIVERY IN A RESIDENCY PRACTICE

Zehra Hussain²; Gretchen Rickards²; Jenna Laughlin²; John Donnelly¹; Sarah Schenck². ¹Christiana Care Health System, Newark, DE; ²Christiana Care Health System, Wilmington, DE. (Control ID #3185413)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Scheduled telephone visits are an effective, convenient alternative to the traditional face-to-face visit in primary care, but there are not yet established models for incorporating these types of visits into residency clinics.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To demonstrate the feasibility of adopting telephone visits into a residency clinic and to measure resident utilization of these visits over a two-year period

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A two-year telemedicine pilot was conducted in our urban primary care residency clinic. Nine categorical medicine residents in our 36-resident program participated. Each resident had one hour of dedicated time per week templated into his/her schedule for telephone visits. Openings that went unfilled were converted into acute office visits.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We reviewed the number and content of the telephone visits to understand how residents utilized their telephone visit time. We also reviewed whether there was any prescription medication management, testing ordered, and/or referrals placed as a surrogate for the complexity of the visit.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): From October 2016-December 2018, there were 273 telephone visits scheduled, of which 152 (54.7%) were "completed", meaning the resident reached the patient and documented a note. The remainder of the appointments were categorized as a "no-show", either because the patient could not be reached (92 visits) or because there was no documentation about the visit (29 visits). The three most common reasons for visits were blood pressure check (74 visits), symptom reevaluation after an office visit (61 visits), and diabetes management (55 visits). Visit types that were most likely to be completed were patient-initiated visits (16 scheduled; 87.5% completed), symptom reevaluation visits (61 scheduled; 70.5% completed), and abnormal results review (18 scheduled; 66.7% completed). Of all completed visits, 48 (31.6%) included prescription medication management, 12 (7.9%) included ordering of laboratory or imaging testing, and 17 (11.2%) included referrals to other providers.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Residents used telephone visits for a wide variety of reasons. Over half of the completed visits included prescription medication management, lab/imaging ordering, or referrals, suggesting these visits were relatively complex and may have replaced the need for in-person care. The completion rate for telephone visits was similar to the in-person show rate in our clinic of 60%. We hope to improve this completion rate through resident and patient expectation setting; limiting telephone visits to specific appointment types might also be beneficial. We found inconsistent documentation practices among residents and now reinforce documentation requirements periodically. We did not bill for telephone visits, but we do plan to do so as reimbursement opportunities for telehealth services become available.

BRIDGING THE GAP: A SUCCESSFUL INPATIENT-BASED CONTINUITY AND CARE COORDINATION INTERVENTION FOR HIGH RISK HOSPITAL HIGH UTILIZERS

Kirstin Knox¹; Jessica Schneider¹; Heather Charboneau¹; Todd Hecht².

¹Hospital of the University of Pennsylvania, Philadelphia, PA; ²University of Pennsylvania, Philadelphia, PA. (Control ID #3183903)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Patients who are frequently admitted to the hospital are a highly vulnerable population, facing medical, social, and behavioral health challenges that are

compounded by discontinuity between hospital admissions and care settings; this discontinuity leads to unnecessary testing, ineffective/ inconsistent treatment plans, patient/provider frustration, and inability to address the underlying issues that drive repeat hospitalization.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): For patients with the highest inpatient utilization on our general medicine service, our objectives were to 1) increase continuity and care coordination across care settings, 2) identify and address the underlying drivers of hospital utilization, and 3) reduce unnecessary health care utilization.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We designed and implemented a successful multidisciplinary intervention aimed at breaking the cycle of high utilization for the most frequently admitted patients on our service. A continuity team, including a hospitalist physician, nurse, and social worker, is assigned to each patient. With guidance from a multidisciplinary committee, this continuity team partners with the patient, caregivers, and providers to a) develop and implement an individualized longitudinal care plan targeting the biopsychosocial drivers of healthcare utilization, and b) coordinate and streamline care across home, outpatient, emergency, and inpatient settings. To complement this full intervention, we recently developed more targeted behavioral plans that can be rapidly implemented in situations where consistency is essential to patient care and safety.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Measures of inpatient utilization including hospital admissions, 30-day readmissions, total hospital days, average length of stay, and emergency department visits.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We have enrolled 47 patients since 2015, and now maintain a 20-25 patient active rolling census. For patients enrolled in our full intervention, six month pre/post analysis demonstrates reduction in admissions, total hospital days, ED visits, and thirty-day readmissions of 52%, 40%, 43%, and 64%, respectively, with minimal change in LOS (n=26 patients with complete six month follow up). Twelve month pre/post data demonstrate a sustained effect, including reduction in thirty-day readmissions of 58% (n=21). For patients enrolled in our targeted behavioral plan intervention, six month pre/post analysis demonstrates modest decreases in admissions, LOS, and ED visits (21-28%), while total hospital days decrease 40% after plan implementation (n=5).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A multidisciplinary and highly individualized approach is essential to developing successful interventions for patients with the highest hospital utilization. The program's greatest strengths lie in our ability to build trust, create consensus among providers, advocate for large scale interventions, and provide continuity and coordination over time and across settings. Investing in a core team to provide extensive care coordination both during and between admissions is key to program success.

BRIDGING THE GAP: THE IMPACT OF AN INPATIENT MEDICAL SUBSTANCE USE GROUP ON KNOWLEDGE GAINS AND OUTPATIENT MAT FOLLOW-UP AMONG OPIOID-USING IV ANTIBIOTIC PATIENTS

Jessica Farrar^{5, 6}; Michelle Gaffaney^{1, 3}; Tess M. Kilwein^{1, 2}; Sharnay Brown^{1, 4}. ¹Denver Health Medical Center, Glendale, CO; ²University of Wyoming, Laramie, WY; ³University of Colorado Anschutz Medical Center,

Denver, CO; ⁴University of Colorado School of Medicine, Denver, CO;
⁵Veteran Affairs Salt Lake City Health Care System, Salt Lake City, UT;
⁶University of Utah, Salt Lake City, UT. (Control ID #3177813)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

How do we improve integrated, comprehensive addictions treatment and continuation of care for opioid users inducted on MAT in hospital settings?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Improve integrated, comprehensive treatment of addiction in a hospital setting; 2. Increase immediate and long-term outpatient MAT follow-up rates; 3. Improve continuity of care between inpatient and outpatient settings

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Inpatient medical patients inducted on medication-assisted treatment (MAT) by an addictions consult team at an urban hospital in the Mountain West are invited to participate in a substance use group during their IV antibiotics hospitalization. In addition to their MAT maintenance, patients participate in the weekly, 1-hour group covering topics of psychoeducation, mindfulness, and motivational enhancement to provide more comprehensive treatment during their hospitalization.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): At both baseline and before discharge, patients are administered a questionnaire assessing knowledge about dual diagnosis conditions (DD) and MAT, outpatient follow-up plans, and intentions to follow-up with MAT after discharge. Immediate (i.e., day after discharge) and long-term (i.e., 6 months after immediate follow-up) outpatient MAT follow-up rates are obtained from chart review and contacting patients/outpatient providers.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Thus far, $N=11$ patients have participated in the group and discharged from the hospital after completing their IV antibiotics treatment. Discharge questionnaires were not obtained from 2 of these patients. While sample size remains low for reliable data analyses, the remaining 9 patients have demonstrated preliminary significant gains in knowledge about addiction/substance use ($t = 2.63, p = .030$), mental health ($t = 5.12, p = .001$), co-occurring disorders ($t = 2.53, p = .035$), and mindfulness ($t = 4.0, p = .004$). In addition, all 11 patients were able to identify a follow-up plan at discharge and immediate outpatient MAT follow-up has been confirmed for 9 of these patients (81.8%). With ongoing data collection and historical data review, we hypothesize additional significant differences in immediate and long-term (i.e., 6 month) outpatient follow-up rates in comparison to historical patients who did not receive the group intervention.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Long-term hospitalizations for opioid users completing IV antibiotics are often costly and rarely address the underlying etiology of the admission. In addition, many hospitals struggle with keeping these patients in the hospital, as few initiate MAT, let alone provide addiction treatment during hospitalizations. However, integrated healthcare systems are well positioned to provide brief psychosocial treatments for these patients. Provision of a group intervention may be an effective strategy in increasing relevant knowledge and immediate follow-up to outpatient rates among this population, ultimately improving the continuity of care for patients and saving in healthcare costs.

BRINGING HOME PRIMARY CARE TO EVERYONE: A NURSE PRACTITIONER CONSULT MODEL

Anita B. Leon-Jhong¹; Susan R. Saxon¹; Cynthia L. Wilson².

¹UPMC, Pittsburgh, PA; ²UPMC Community Provider Services, Pittsburgh, PA. (Control ID #3184540)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Many PCPs do not have the time, training or inclination to provide home visits, even as their patients may have difficulty travelling to the office.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Provide high-quality medical assessments to frail and homebound patients in collaboration with their PCPs. 2. Increase the program's impact by identifying what types of visits are most effective.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The UPMC Home Primary Care program is a consult-style service which is staffed by the UPMC Advanced Practice Provider group. This group includes six nurse practitioners (NP) who cover distinct geographic regions of Pittsburgh. When a UPMC PCP identifies a patient who could benefit from a home visit, a referral order is placed and the patient is scheduled with a nurse practitioner within 1-4 weeks. Common referrals include need for face-to-face (F2F) visit to obtain durable medical equipment (DME) or home health services, management of chronic medical conditions, and evaluation of home safety and support systems. The nurse practitioners have expertise in home-based care, palliative care and community services. The nurse practitioner documents all findings, including physical exam, medication reconciliation and any recommendations, in the electronic medical record. The PCP then decides how to implement changes based on the NP recommendations. Visits are billed through the patient's insurance and patients pay the same co-pay as for a primary care office visit.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The following information is collected via chart review for all visits. Data will be used to better understand the type of patient we are serving in order to target referrals. We also hope to capture the impact of each visit by recording how often measurable tasks are performed. 1. Patient age, sex 2. Date of last PCP visit 3. Hospitalization in last 6 months 4. F2F documented for DME/home health 5. Medication issue identified (patient not taking medication properly, adverse effect) 6. Goals of care discussed, hospice referral Future measures which are not currently being tracked include: 1. Referral to community service 2. Recommendation of new medication

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In 2018, 237 home visits were conducted on 157 unique patients. The patients were predominantly female (61%) with median age of 79 years. 41% of patients had been hospitalized in the 6 months prior to the visit. 13 patients were deceased within 1 year of the visit. The median time since last PCP encounter was 140 days, with 17% of visits occurring on patients who had not seen their PCP in > 1 year. 29% of visits included F2F documentation for DME/home health. In 24% of visits a significant medication issue was identified. Advanced care planning was documented in 8% of visits and 8 patients were referred to hospice.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1. The home visit is an ideal way to connect with frail individuals and the nurse practitioner consult model expands access to this service 2. Key services performed during a visit include F2F documentation for DME/home health, identification of medication issues and advanced care planning.

BUILDING A PRIMARY CARE COLLABORATION BETWEEN A COMMUNITY MENTAL HEALTH CENTER AND SAFETY NET MEDICAL CENTER: A QUALITY IMPROVEMENT APPROACH

Bijan Ghaffari¹; michelle cleeves². ¹University of Colorado, Denver, CO; ²Denver Health, Denver, CO. (Control ID #3185551)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

How do we improve access to and engagement in primary care for patients with severe mental illness (SMI)?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Increase enrollment and engagement for patients with SMI in a co-located primary care clinic. 2. Implement referral and communication guidelines between a community mental health center (CMHC) and primary care clinic to optimize access and utilization.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

Noting the disparity in mortality and morbidity for patients with SMI compared to the general population, Denver Health and the Mental Health Center of Denver (MHCD) collaborated on a primary care clinic (PCC at MHCD) to improve primary care access for MHCD clients. Co-location within the MHCD clinic reduces barriers such as travel and unfamiliarity for patients needing primary care. Both organizations are safety net care systems serving Denver. 79% of MHCD's clients reported having no PCP, despite having the PCC at MHCD in the same building. An assessment of access barriers was performed through chart review, reimbursement data, provider surveys, and interviews. The first intervention cycle used reimbursement data to target clients of both organizations that had lapses in primary care and encouraged reengagement. The next intervention includes developing and disseminating training materials for case managers to promote best practices for supporting engagement in primary care.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Monthly reports allow us to monitor patients with lapses in care at the PCC at MHCD. The outreach intervention is evaluated through quantitative measures and countermeasures, including patient contact, agreement to schedule, and attendance of appointments. MHCD staff participated in a pre-intervention survey to elicit practices, beliefs, and challenges with primary care engagement. A similar survey will be distributed after the training intervention to evaluate changes in perceptions and practices.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Survey responses of MHCD staff revealed that a majority believed primary care would benefit their patients, yet there was variability in practices. Identified challenges include lack of knowledge, navigation of healthcare systems, and higher priority given to psychosocial factors. From September to November, 18 PCC at MHCD patients (4% of clinic empanelment) had lapses in primary care longer than 9 months. Direct patient outreach resulted in 7 patients scheduled, and an

86% attendance rate. Of 27 emails sent to notify case managers of engagement lapses, 9 patients were scheduled, and 56% of appointments were attended. A focus group identified best practices that will be compiled into training materials for case managers. In collaboration with MHCD leadership, PCC at MHCD will have formal orientations with new case managers.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This project has illuminated the logistic challenges of an interinstitutional collaboration and the cultural differences between a large medical center and a CMHC. The rapid cycles of QI allow for brief interventions that target the highest need patients while also improving the partnership between organizations.

BUILDING COMMUNITIES AND ALLEVIATING BARRIERS: TRAUMA SENSITIVE YOGA FOR FEMALE IMMIGRANTS IN THE PRIMARY CARE SETTING

Katherine Rizzolo¹; Sean Lena¹; Maha Jaber^{2, 1}; Adriana Eurich^{2, 1}; Diana Stade²; Brian King¹; Lesley Gordon¹. ¹Maine Medical Center, Portland, ME; ²Tufts University School of Medicine, Boston, MA. (Control ID #3185631)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

There are significant barriers and limitations to the wellness resources currently available to the immigrant communities in Portland, Maine.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Improve healthcare delivery to immigrants by alleviating barriers to care Improve social isolation of female immigrants through community based programming Integrate community resources for immigrants into the primary care setting

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

Maine Medical Center's Internal Medicine Resident Clinic serves a large number of Southern Maine's immigrant population. For many, traditional services such as physical therapy, nutrition, and counseling carry logistical obstacles such as cost, lack of transportation, and unmet childcare needs. Our pilot program is a novel community trauma-sensitive yoga program for immigrant women. The program is low cost (sliding scale) with transportation and childcare included. Women from Iraq, Syria, and Somalia were selected for participation due to their underrepresentation in traditional referral based programs given the aforementioned barriers as well as significant social isolation in the community. A thorough review of community resources indicated this group is underrepresented in nonclinical community programming. A patient focus group of Arabic-speaking women noted the exact issues of social isolation and barriers to attendance noted by providers. Participants were self-referred from our outpatient resident clinic via providers and social workers. Inclusion criteria included women over age 18 and history of immigration.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Participants of one or more class completed an anonymous post-intervention survey focused on barriers to class attendance and feedback on how the class affected their pain and quality of life.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The first session had 12 total participants from Iraq, Djibouti, Afghanistan, and Somalia. 40% had barriers to attendance including transportation and childcare. 100% of participants felt

the class alleviated their physical and/or emotional pain. 100% reported they would sign up for another class.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our immigrant community experiences deep suffering, which encompasses physical and emotional pain from the traumas they endured in their home country, the loss of their homeland, and the many struggles of adapting to a foreign country and culture. Unlike traditional referral-based models, a community-based model offers much more than relief from physical pain. Most participants found a sense of community and improvement in social isolation. In addition, elimination of barriers such as childcare and transportation issues increased participation and enjoyment of the class. This is an opportunity to recognize the benefits of community-based programming in treating patients of significant trauma.

BURNOUT AMONG APPS

Brianna C. Pearson; Tareq Islam; Ana Everwine. Wake Forest Baptist Health, Winston Salem, NC. (Control ID #3184549)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Are APPs (advanced practice provider) burning out and if so, why?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Evaluating the prevalence of APP burnout and how stress, job satisfaction, and workplace factors contribute to burnout.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): AMA's validated 10 question Mini-Z survey was adapted to RedCap and distributed via email to approximately 550 APPs (NP, PA, CRNA, and CNM) at Wake Forest Baptist Health (inpatient and outpatient). Information collected include self-reported data on demographic variables (sex, title, setting, specialty, and years in role), subjective feeling of burn out at work and nine work place factors (stress, job satisfaction, work control, environment, teamwork, value alignment with leadership, documentation time, home EMR use, and EMR proficiency) on a Likert scale of 5 (strongly disagree to strongly agree, poor to optimal).

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Person correlation coefficient was calculated between burnout category and work related factors. Prevalence of different subjective feeling of burnt out at work and work related factors were calculated among overall and stratified by demographic variables. Likelihood ratio was calculated to measure significance of difference.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Total 229 surveys were returned and analyzed. 38.9% APP feels burnt out at work. This prevalence is higher among NP (44.4%) compared to PA (33.3%), but not statistically significant (p-value 0.09). No difference exists by gender, clinical setting (inpatient vs. outpatient). Interestingly APP with >5 years of experience (48.5%) felt more burnt out than others (0-2 and 3-5 years, 27.1% and 35.7% respectively, p-value 0.01) and also felt that the care team works poorly together. Self reported work place burn out is highest among APP working in internal medicine (48.2%) and lowest among Surgery APP (19.4%) (p-value 0.04). Job satisfaction, stress, control of workload, efficient documentation, hectic work atmosphere, professional values, team work, and EHR efficiency were significantly associated with burn out at work (Pearson co-efficient value of -0.53, +0.52, -0.53, -0.37, +0.43, -0.40, -0.45, +0.25 respectively with p-

value <0.001 for all). 18.3% NPs perceive poor control over workload compared to 8.8% among PAs (p-value 0.03). Statistically significant more inpatient APPs feels work atmosphere is hectic and they also spent excessive time in electronic health record (EHR) at home compared to outpatient APP.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Healthcare has been evolving into a more team-based system in order to help share the burden of a growing patient population which at the same time, demands high quality and timely care. Advanced Practice Providers (APPs) stand at the nucleus of this model and face many of the same obstacles and stress levels as their physician colleagues. However, there is very little research to date on APP burnout. Our survey showed that the prevalence of work place burnout is high among APPs.

CALL ME MAYBE? IMPROVING UTILIZATION OF TELEMEDICINE IN A VA RESIDENT CLINIC

Kaleb Keyserling¹; Jared Huber¹; Carol Sprague^{2, 1}. ¹Oregon Health & Science University, Portland, OR; ²Portland VAMC, Portland, OR. (Control ID #3149915)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Residents have limited exposure to telemedicine, an important tool in providing care for physically and geographically isolated patients.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Increase resident exposure to telemedicine, a valuable health care tool. 2. Improve access to care for the veteran population we serve at the Portland VA

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): With rapid improvements in technology, telemedicine is becoming common place in modern medical practice, allowing patients quicker and more convenient access to health care and closer follow-up with providers. Residents have little training on utilizing telemedicine. The Portland VA Resident and Faculty Practice offers a unique opportunity for residents to schedule follow-up telephone appointments with patients. Residents were first offered the opportunity to schedule phone appointment at our clinic in 2013. Appointments were originally scheduled in half day blocks, once every three months. A review of the phone clinic data showed that only 18% of available resident phone appointments were utilized. A resident survey showed opportunity to improve general knowledge on conducting phone visits as well as multiple scheduling issues hindering utilization. Based on these results, we designed and conducted a phone clinic orientation addressing the practical and clinical aspects of the phone visit, including how to schedule and encounter the visit as well as which patients and issues are appropriate for a phone visit. Residents were given a 30 minute protected time slot for phone visits each clinic week and a template was created to facilitate documentation.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The number of phone appointments completed per month will be tracked on a run chart as a process measure. Repeat surveys we will be used to assess resident understanding of phone clinic and the scheduling process as our main outcome measures. We will track residents' enthusiasm to keep using phone clinic as a balancing measure.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): After six months, the number of phone visit encounters increased by 114% (120 vs 56 appointments) when compared to the same time interval the previous year. Repeat survey results showed residents had improved knowledge of when appointments were scheduled (80% vs 57% were able to see their schedule in advance). 84% of residents indicated they plan to utilize the phone clinic going forward. We have identified additional opportunities for improvement. Future plans include working with providers and administrative staff to further streamline the scheduling process, and developing a curriculum to improve comfort with conducting a visit over the phone. Through these changes we hope to continue to increase phone clinic utilization and better serve our patients' healthcare needs.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Using simple quality improvement methodology, we have dramatically increased resident participation in telephone clinic with continued enthusiasm for the project. Through doing so, we have increased resident exposure to a valuable health care tool that is likely to remain a vital component of primary care going forward.

CAN CONDITION-SPECIFIC EDUCATIONAL VIDEOS ACTIVATE PATIENTS PREPARING FOR DISCHARGE?

Meghan L. Rudder¹; Theresa Fuller¹; Nicholas Piniella¹; Catherine Yoon¹; Stuart R. Lipsitz²; Jeffrey L. Schnipper²; Anuj K. Dalal². ¹Brigham and Women's Hospital, Brookline, MA; ²Brigham and Women's Hospital, Boston, MA. (Control ID #3182281)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

At discharge, care responsibilities shift from clinician to patient; yet due to rising volume of care transitions, shorter hospital stays, increasing demands on physician time, lack of standardized educational content, and poor patient comprehension, many patients are ill-prepared for this transition.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Activated patients-those with the knowledge, confidence, and skills to manage their health-are more likely to execute a discharge plan. We hypothesized that educational discharge videos may increase patient activation. Our goals were to determine: the acceptability and feasibility of implementing condition-specific educational discharge videos for general medicine inpatients, and whether video education is associated with patient activation.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We conducted a sub-study of patients enrolled in the Patient-centered Discharge Toolkit (PDTK) study on general medical units at an academic medical center in Boston, MA. Patients were eligible if they had a discharge diagnosis for which one of 19 condition-specific educational videos (Telesofia Medical, Inc) was available. Patients who agreed to participate were invited to view the video on a tablet before discharge. All patients (viewers and non-viewers) were asked to complete a 13-Item Patient Activation Measure survey (PAM-13, Insignia Health) at discharge and during a 30-day follow-up call.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We analyzed demographic and clinical data and compared PAM scores at, and 30 days after, discharge as well as 30-day readmission rates between viewers and non-viewers. We also

compared patients who viewed the videos to a principle component-matched cohort of patients from the PDTK study.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Of 115 patients screened, 45 (39.1%) were eligible to participate; of the 36 patients who were approached, 18 (50.0%) consented to view the video. Viewers were younger than non-viewers (56.2 versus 68.9 years of age, P=0.02) and more likely to be male (72.2% versus 38.9%, p=0.04). Viewers had significantly higher mean PAM scores compared to non-viewers (75.5 vs 60.2, p=0.05). A greater proportion of viewers than non-viewers had PAM levels 3 (66.7% vs 38.9%, p=0.09). At 30 days, viewers had higher PAM scores than non-viewers (71.16 vs 58.9, p=0.32) and fewer readmissions than non-viewers (5.6% vs 11.1%, p=0.55), but these were not statistically significant.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1 Many general medicine patients are willing to watch condition-specific educational videos at discharge, but a video specific to the clear, accurate discharge diagnosis must be available. 2 Videos were more acceptable to younger and male patients which may be due to greater comfort with technology, presence of a single discharge diagnosis, or lack of clarity in relevant diagnoses for older patients with co-morbidities. 3 Viewing condition-specific discharge videos may increase patient activation, or more activated patients may elect to view these videos. 4 Future studies should evaluate pre- and post-intervention PAM scores and outcomes for patients randomized to condition-specific videos.

CAN PATIENTS HUMANIZE THEIR ELECTRONIC HEALTH RECORD TO FACILITATE STRONGER CONNECTIONS WITH CARE TEAMS?

Jeana Holt¹; Rachel Cusatis²; Onur Asan³; Joni S. Williams²; Kathryn E. Flynn²; Bradley H. Crotty¹. ¹Medical College of Wisconsin, Milwaukee, WI; ²Medical College of Wisconsin, Milwaukee, WI; ³Stevens Institute of Technology, Hoboken, NJ. (Control ID #3185284)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Electronic health records (EHR) contain lists of medications, problems, and other healthcare transactions, but the representation of who an individual patient is, their context, and their preferences are poor.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Empower patients to provide their contextual data (needs, values, preferences, and barriers) to their care team through the EHR. Provide tools for care teams to more efficiently develop meaningful connections with patients.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We implemented a web-based consumer informatics application that creates a patient profile of contextual data using questions derived from communications research. The application was tested in five primary care clinics where patients were invited by email ahead of visits. Patients provide information about "My Self," "My Health," and "My Care" through free-text and checklist entries related to their health, preferences, care, and agenda for their next visit. Data are summarized into a one-screen dashboard that is available for view within the EHR.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): To assess if patients felt empowered and care teams felt more connected, we conducted a qualitative

study. We interviewed 21 clinicians (physicians, nurses, assistants, and pharmacists) and conducted 6 patient-user focus groups (n=26) to assess the adoption and use of the application. We used inductive and deductive qualitative analysis drawn from the Consolidated Framework for Implementation Science (CFIR).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Over 8,000 patients used the application within the first two years at our pilot locations. Regarding facilitators to adoption, clinicians identified the unique information not otherwise captured; enhanced team-based involvement; and alignment of internal motivators to provide patient-centered care. Barriers were concerns with a potential widening of a digital divide and click fatigue of the EHR. The deductive results spanned four domains and seven constructs of CFIR, including Innovation Source and Compatibility, as critical areas that promoted the use of the application. Patients reported the platform was easy to navigate and provided a new avenue to share sensitive topics. Completion of their profile promoted reflection of their health goals, challenges, and priorities, which led to targeted conversations about issues important to them. Patient adoption was enhanced when clinicians endorsed the application and referenced the data during the visit. Regarding effectiveness, inviting patients, summarizing data in an accessible electronic location, aligning with organizational and personal drivers, and focusing attention beyond physicians can facilitate the adoption of patient-contextual data into care.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): We found the purposeful and integrated technology, perceived improvement in team-based efficiencies, and facilitation of patient-centered care were the primary drivers of clinician adoption. Patients identified creating a space for sensitive topics and driving the alignment of patient, and provider goals were important motivators that enhanced the use of the program.

CARE PLUS: FIVE YEARS OF PROVIDING TEAM BASED CARE TO HIGH NEED HIGH COST PATIENTS.

Melanie Martin¹; Feben Girma²; Julia Rushing³. ¹Wake Forest, Greensboro, NC; ²Wake Forest Baptist Medical Center, Winston-Salem, NC; ³Wake Forest, Winston Salem, NC. (Control ID #3184094)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Multidisciplinary team-based primary care and care coordination can lead to sustained decrease in hospital admissions and ED utilization for high need high cost patients at an academic safety net practice.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Share data of characteristics of high need high cost patients. Describe an effective multidisciplinary care model for these patients and provide data on decreased hospital utilization after enrollment in program. Share lessons learned

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): For the past five years, Care Plus has provided team-based primary care and care coordination for high need high cost patients from academic safety net practices. Patients with high admission or ED rates are enrolled in our care model that includes more frequent clinic visits, home visits, intensive outreach, and a focus on both social determinants of health and mental health

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Describe characteristics of high

need high cost patients. Outcome of program is measured in terms of rate of admissions and ED utilization of patients in year prior to enrollment as compared to years after enrollment.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We have enrolled approximately 360 patients in the program. Characteristics of enrolled patients provide compelling evidence of why such a broad team is needed to optimally serve these patients. Our patients are medically complex with an average of five comorbid conditions and twelve medications at the time of enrollment. Additionally, 69% have mental health diagnoses, 38% have substance use issues, and 38% score less than or equal to 21 on the Montreal Cognitive Assessment, indicating moderate cognitive impairment. From a social determinants of health perspective, our patients have a high prevalence of poverty with related food insecurity, difficulty affording medications and safe housing, and transportation challenges. Through a care model that acknowledges and addresses social determinants of health, more frequent visits, and a focus on mental health, we have demonstrated a decrease in ED utilization and hospital admissions compared to pre-enrollment levels that has persisted over years of enrollment. A comprehensive analysis is underway, but preliminary results show that when we compare admissions the year prior to enrollment to the first year of enrollment, admissions decrease by 49.5%. If analysis is limited to patients that remain in our program for at least 12 months, the decrease in the first year in admissions is 39.5% and in ED visits is 30.2%, compared to patients' historical selves. We also have shown sustained benefit in enrolled patients, with evidence of ED utilization rates over our population decreasing from a median of 0.41 ED visits per month prior to enrollment to 0.22 ED visits per month after enrollment (47% reduction).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The challenge of caring for high need high cost patients can be mitigated through multidisciplinary team-based primary care. Improving patient engagement by addressing social determinants of health and mental health are key to solving this challenge.

CHICAGO STREET MEDICINE

Frederick T. Gibson¹; Karim G. Khan²; Joshua Smith²; Melissa A. Socarras²; Brian Borah²; Sarah Messmer². ¹University of Illinois College of Medicine, Chicago, IL; ²University of Illinois, Chicago, IL. (Control ID #3185971)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

In light of inequities in healthcare provision and outcomes for the unsheltered homeless, there is a need for holistic care that will provide seamless integration between outpatient, street-based, and inpatient hospital care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Create an academic model of street medicine which incorporates students and residents from multiple disciplines in leadership roles. Develop and implement a street medicine system to provide healthcare services and social support to unsheltered homelessness as they transition between traditional avenues of healthcare and street-based care.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

CSM was started by a group of medical students and residents with the goal of improving the well-being of those experiencing unsheltered homelessness in Chicago by performing weekly "street runs" - visiting homeless communities in Chicago to provide medical care, social support, health education, and hygiene essentials. CSM has since expanded to include physicians,

pharmacy residents, social workers, and occupational therapists. Interventions performed by CSM include wound care, OTC medications, antibiotics, inpatient social support, post-discharge follow-up, suture removal, removal of a PICC line, assistance with housing referrals and documentation, and triage. CSM is uniquely situated to follow and advocate on behalf of patients who are admitted to the hospital, and upon discharge, CSM is able to provide follow-up to a population that was often previously lost to follow-up.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Qual: 3 case presentations of CSM patients, 1 presentation of medical student leader development Quant: patients cared for, residents participating, students participating, pharmacists participating, chief complaints, interventions

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A 37yo W who was initially found with rigors and brought to the hospital where she was found to have fungemia, infected pleural effusions and DVTs. Over the course of 1.5 years, a therapeutic relationship has been developed. She has required multiple admissions for SSTIs and fluid overload, but has not left AMA once. We are helping her obtain a new ID. She continues to struggle with addiction but has progressed from contemplation to the preparation stage. A 54yo M who presented with a chronic arm wound from IVDU. He underwent surgical debridement. CSM continued close wound care upon discharge while also maintaining a link between the patient and social work. He was provided housing via a hospital based housing first initiative. Quant findings: 3 physicians, 13 residents, 40+ student volunteers, 30+ street runs, 15 different locations

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Student-fueled academic street medicine is a replicable model that nurtures leadership and the professional development of students and residents. Street medicine has a role in outpatient and inpatient settings of care. Through an interdisciplinary construct, led by medical students, resident physicians, and resident pharmacists, CSM presents an innovative way to advocate for and provide care to the unsheltered homeless everywhere from the tentside to the bedside.

CLINICAL DECISION SUPPORT TO MITIGATE RISKS ASSOCIATED WITH HIGH-DOSE OPIOID USE FOR CHRONIC NON-CANCER PAIN

Eboni Price-Haywood; Jeffrey Burton; Todd Burstain. Ochsner Health System, New Orleans, LA. (Control ID #3184912)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Clinical practice guidelines recommend what to do for safe opioid prescribing for chronic non-cancer pain but do not provide guidance on how to implement best practices.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To implement electronic medical record clinical decision support (EMR-CDS) to improve guideline concordant care in ambulatory settings and reduce rates of prescribing high-dose opioids (morphine equivalent daily dose, MEDD) >90 mg.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): In October 2017, Ochsner Health System (Louisiana's largest integrated delivery system) launched EMR-CDS aligned with CDC Practice Guidelines. EMR-CDS identifies patients prescribed opioids for the prior 120 days. Providers are prompted to complete the Opioid Risk Tool (ORT) to calculate risk of

opioid-aberrant behavior. Patients with at least one of the following conditions are flagged as high-risk: benzodiazepines co-prescriptions; opioid dose >90 mg; or diagnosis of substance abuse. The opioid health maintenance tool displays whether patients are up-to-date on best practices. ORT score, MEDD, and hyperlinks to the Louisiana pharmacy drug monitoring program data and pain management agreement are visible in the medication order composer.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The main outcome is change in percentage of patients with high dose opioid prescriptions.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The chronic opioid health maintenance tool identified 13,065 patients seen between October 2017 and August 2018 - among whom 22% were prescribed high-dose opioids. Most patients are female (60%), white non-Hispanic (67%) with a mean age of 57 years. Common pain syndromes include back/neck/knee pain (52%). Almost 30% of patients have depression/anxiety while 19% have a history of substance abuse. Among patients with ORT scores (n=2040) documented, 23% were medium/high-risk for aberrant behavior. Patients with ORT scores compared to patients without ORT scores have higher rates of pain agreements (38% vs 8%); UDS (26% vs. 13%) and naloxone prescriptions (9% vs. 1%, all p<0.001). Overall, while 59% of patients were screened for depression, <1% had PEG-3 (pain) documented. The odds of being prescribed opioids >90 MEDD was higher among patients with depression/anxiety (OR [95% CI]: 1.30 [1.12-1.52] or substance abuse (4.65 [3.99-5.42]); and lower among patients co-prescribed non-opioid pain medications (0.84 [0.73-0.97]) or receiving specialty service (0.8 [0.73-0.96]). Among 9,888 patients on chronic opioids before and after launching EMR-CDS, only 6% had decrease in dosing to <50 MEDD.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): EMR-CDS helped providers identify patients who are at risk for opioid misuse and employ mitigation strategies but did not substantially reduce the rate of high-dose opioid prescribing.

CO-PRODUCTION OF VISIT NOTES IN THE ELECTRONIC HEALTH RECORD USING OURNOTES - ONE INSTITUTION'S IMPLEMENTATION

Stephen K. Liu²; Brooke Herndon²; Eugene Nelson¹; Kathryn Sabadosa¹; Jan Walker⁴; Tom Delbanco³. ¹Geisel School of Medicine at Dartmouth, Lebanon, NH; ²Dartmouth-Hitchcock, Lebanon, NH; ³Beth Israel Deaconess Medical Center, Boston, MA; ⁴BIDMC, Brookline, MA. (Control ID #3140989)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): To determine if co-production by patients and providers of visit notes for scheduled office visits is feasible and can improve patient engagement and provider documentation burden at a single site.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Develop a process to implement OurNotes where patients and families can contribute to the writing of their own progress notes before clinic visits by sending recent health history and agenda items before each visit. Assess the program's impact on patient engagement and experience and provider documentation burden from surveys of patients and providers.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Patient engagement is considered a central tenet of safe, effective, high value care. OpenNotes is an international program that offers patients online access

to review their visit progress notes. OpenNotes originally was developed at Beth Israel Deaconess Medical Center (BIDMC) and as a next step, the BIDMC team developed a program entitled OurNotes which is a program that invites patients to contribute information online before their office visits, thereby, co-producing their visit notes in the electronic health record. The goal is to have patients complete tasks such as reviewing prior notes, writing an interval health history, and identifying goals for an upcoming visit which could lead to more meaningful patient-doctor interactions, improved patient safety, and decreased documentation burden for doctors. As one of four sites, the General Internal Medicine primary care team at Dartmouth-Hitchcock Medical Center is conducting a pilot test of the OurNotes program using the patient portal through the Epic electronic health record. Patients who participate in the program are sent an invitation a week before a regularly scheduled visit to send an interval history and agenda items before the visit through the secure messaging system. The providers then can review this message and cut and paste the message into the patient's progress note before the visit.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We will survey patients and providers about the following outcome measures: patient participation rate, content of information provided by patients and use of patient information by clinicians during visits.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): While we are in the preliminary stages of implementation, patients that have participated in the OurNotes program find it helpful to send health concerns and agenda items before visits. Providers also find it helpful to know what patients want to address before visits, prioritize agenda items and pending orders before the visit. Visits using OurNotes lead to less time reporting history and transcribing by providers which allows more time for shared decision making and reviewing treatment options.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Implementation of OurNotes was simple and straightforward using an established patient portal in an electronic health record in a general internal medicine clinic and in selected patients has improved patient experience and engagement and potentially decreases provider documentation burden during office visits.

CREATING AN EMR-BASED DATABASE TO MONITOR ADHERENCE TO THE CDC OPIOID PRESCRIBING GUIDELINE IN PRIMARY CARE PRACTICES

Jaclyn Yamada²; Joanna L. Starrels¹; Anna Flattau¹; Iby Thomas¹; Sharon Rikin¹. ¹Montefiore - Albert Einstein College of Medicine, Bronx, NY; ²Albert Einstein College of Medicine, Bronx, NY. (Control ID #3185566)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Primary care practices have a growing need to monitor adherence to guidelines for prescribing opioids for chronic pain, but many have not developed systematic ways to do this using electronic medical record (EMR) data.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To create an EMR-based chronic opioid therapy (COT) database to monitor adherence to the CDC guideline in primary care settings.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A team of primary care providers at a large, urban, academic health system in Bronx, NY selected five primary care practices, which share an Epic EMR, to

pilot the COT database in 2018. In partnership with a CDC Quality Improvement (QI) Collaborative, the team developed QI metrics corresponding to seven of the CDC Guideline recommendations: regular assessment, evaluation of pain and functional status, avoid concurrent benzodiazepines, discuss risks and benefits, urine drug test, prescription monitoring program (PMP) review, and overdose risk reduction. The COT database and QI metrics were refined based on feasibility of data extraction and feedback from front-line clinicians.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We judged success as the ability to define the COT population and QI metrics in a way that is reproducible and extractable from the EMR and acceptable to front-line clinicians.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We identified 408 patients (1.9% of all patients) that (1) were seen at the clinics within 12 months and (2) were prescribed COT, defined by 4 opioid prescriptions in the last 6 months. Patients were excluded if they received treatment for opioid use disorder. Four of the seven QI metrics were directly extractable from the EMR: regular assessment (office visit < 90 days), avoid concurrent benzodiazepines (none prescribed in <6 months), urine drug test (performed <12 months), and overdose risk reduction (naloxone prescribed or dispensed). The other three QI metrics required manual chart review: assessment of pain and functional benefits (PEG scale <90 days), discuss risks and benefits (controlled substance agreement <12 months), and PMP review (documented verification <90 days). The database was shared with front-line clinicians through clinician- and practice-level reports which included the number of patients on COT and completion of QI metrics. Epic EMR enhancements are underway to improve EMR-based capture of the 3 QI metrics that required manual chart review.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Operationalizing COT guideline recommendations into EMR-based QI metrics requires collaboration and refinement with front-line clinicians, IT analysts, and subject matter experts to understand how primary care practices are documented. EMR-based QI metrics may not fully capture clinical practices. For example, completion of pain and functional assessment was satisfied with a documented PEG scale; however, this may not capture those who met the guideline through another assessment type. This initiative highlighted opportunities for standardization of processes, such as controlled substance agreements. These lessons can help others to create robust EMR-based databases to monitor adherence to COT guidelines.

DECISION SUPPORT AND OFFICE WORKFLOW CHANGES FOR INFLUENZA VACCINATION IN PRIMARY CARE: MEASURED PERFORMANCE AND ACTUAL VACCINE ADMINISTRATION

Stephen Persell^{1, 3}; Ji Young Lee²; Nora Lewin^{2, 3}; Sonali K. Oberoi³; Erik Orelin^{3, 1}; Philip Roemer^{1, 3}; Michael Schachter³; Kathryn Thomas³; Banu Yagci³. ¹Northwestern University, Evanston, IL; ²Northwestern University, Chicago, IL; ³Northwestern Memorial Healthcare, Chicago, IL. (Control ID #3182720)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Influenza vaccination rates are not optimal.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Improve performance on a publically reportable influenza measure, 2) Increase rate of onsite influenza vaccination.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS.

OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS: We sought to examine changes in influenza vaccination over three vaccination seasons (2015 to 2018) following decision support improvements and team changes. The setting was 21 adult primary care clinics within a large health system in Chicago, IL and its suburbs. At the start of Season Two, clinical quality leaders and information system experts implemented clinical decision support changes in the electronic health record to facilitate documentation of components related to influenza vaccination (e.g., prior receipt that season, prefers to obtain elsewhere, refusals). Subsequently, they implemented changes to rooming workflow for medical assistants, licensed practical nurses, or registered nurses to promote vaccination at the visit, prepare vaccine orders, document care done elsewhere and record patient refusals. Workflow changes were fully implemented by the start of Season Three.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Modified version of performance measure Preventive Care and Screening: Influenza Immunization; proportion of eligible patients receiving onsite influenza vaccination.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): There were approximately 120,000 eligible patients each season and 267 to 298 eligible clinicians. The influenza vaccination performance measure increased substantially each year and was 40.6% in Season One, 62.5% in Season Two and 76.4% in Season Three ($P<0.001$ for all changes). Corresponding values for onsite vaccination were 27.7%, 28.8% and 31.5%. The adjusted odds ratio for receiving onsite influenza vaccination in Season Two compared to Season One was 0.94 (95% confidence interval 0.92, 0.96). Patients were more likely to receive onsite vaccination in Season Three compared to either of the prior seasons—adjusted odds ratio for Season Three vs. Season Two 1.14 (95% CI, 1.12, 1.16), adjusted odds ratio for Season Three vs. Season One 1.07 (95% CI 1.05, 1.09).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Sequential changes in computerized clinical decision support to make the documentation of elements related to influenza vaccination easier and the addition of new clinical workflows in the patient rooming process were associated with very large improvements in measured performance over two vaccination seasons and with a modest increase in the proportion of patients receiving clinic-administered influenza vaccination. Changes to rooming workflow and the function of care team members appeared to be most important factor for increasing onsite vaccination.

DEMYSTIFYING THE INFLUENZA VACCINE: VIDEO MEDIA IMPROVES VACCINE ACCEPTANCE RATES IN AN UNDER-SERVED URBAN RESIDENT-PHYSICIAN PRIMARY CARE CLINIC

Gayatri Malhotra-Gupta^{3, 2}; Alexandra I. Kreps^{3, 2}; Lucas Policastro^{1, 2}; Emmanuel M. Francis^{1, 2}; Leonel Mendoza^{1, 2}; Daniel Kashani^{1, 2}; Andrew A. Chang^{3, 2}; David L. Stevens^{4, 2}; Lucas Dreamer^{3, 2}; Melissa S. Lee^{1, 2}. ¹Kings County Hospital, Brooklyn, NY; ²SUNY Downstate Medical Center, Brooklyn, NY; ³NYC Health + Hospitals/Kings County, New York, NY; ⁴NYC Health + Hospitals/Kings County, Brooklyn, NY. (Control ID #3186166)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Many of our primary care patients are hesitant to accept the influenza vaccine, resulting in a low vaccination rate. Our goal was to increase vaccination from a baseline of 35% (2017 influenza season) to

50% during the 2018 influenza season using a resident-made informational video.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): - Improve patient health literacy around the influenza vaccine - Identify common reasons for influenza vaccine declination in our patient population - Create and measure the impact of an educational video based on the CDC fact sheet, "No More Excuses: You - Need a Flu Vaccine" on local influenza vaccination rates

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Internal Medicine residents at NYC H+H/Kings County produced a 2-minute educational video addressing common reasons for flu shot declination. Starring physicians and patient care assistants, the message was delivered by culturally familiar staff. From October to December 2018, patients were asked their reasons for declining influenza vaccination. An educational video was played in the exam room while the resident met with his/her attending preceptor. Subsequently, residents engaged in a shared decision making (SDM) discussion around the risks and benefits of flu vaccination. Patients were then offered the flu vaccine.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Vaccine acceptance was recorded both before and after education with a locally produced video and SDM discussion. The intention-to-treat principle was applied in cases where video playback was refused. The primary objective was to measure the conversion rate of initial flu vaccine declination to acceptance following intervention. A secondary objective was to enumerate the frequency of patients' preconceived reasons for flu vaccine refusal.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The most common reason our patients refused the flu vaccine was, "I don't get the flu." In October, flu vaccine acceptance increased by 16.7% following the video and SDM intervention; 58.3% patients received a flu shot. More patients agreed to vaccination in November (81.25%) and December (70%), and 9 out of 23 (39%) patients who initially declined the flu vaccine changed their mind post-intervention as the flu epidemic hit our community. Consistent use of the educational video and SDM improved uptake of flu vaccination in our population, leading to an increase from a baseline of 35% in the 2017 season to 72.4% during our study period.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): After identifying and addressing the prevailing myths of flu vaccination, and locally producing a video to educate patients on the importance of influenza vaccination, the rate of flu vaccination in our patient population increased. This innovative form of patient education using video media during office visit time improved SDM discussions around vaccination. Key components included a tailored, culturally relatable educational platform featuring our patients' healthcare team. We highlight here the importance of using personalized, alternative media as an approach to improving health literacy around preventive health and wellness.

DEVELOPING A DATABASE TO DRIVE AMBULATORY HEALTHCARE INNOVATION

Lisa Rotenstein¹; Ashley Shaw²; Margaret Krasne²; Charles Safran³; Sandhya K. Rao⁴; Russell Phillips². ¹Brigham and Women's Hospital, Boston, MA;

²Harvard Medical School, Boston, MA; ³Harvard Medical School, Brookline, MA; ⁴Massachusetts General Hospital, Boston, MA. (Control ID #3185918)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Mechanisms to share knowledge about ambulatory practice improvement among on-the-ground innovators are lacking, leading to replication and stifling of improvement; we developed and implemented a novel knowledge-sharing platform.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES):

1) To develop a platform through which physicians can publish and share practical information about improving ambulatory systems of care. 2) To connect clinical innovators conducting similar work across practices to spread innovation. 3) To expose pre-medical/medical students to principles of ambulatory healthcare improvement.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

\$320 billion are wasted each year in the US on healthcare systems inefficiency. Although clinicians are constantly improving processes and innovating in how they deliver care, process improvement is often uncompensated and an afterthought. No solution enables on-the-ground clinicians and administrators to share their ambulatory care innovation expertise and to learn from one another. We developed a database for collection of structured information about implementation of healthcare innovations. We subsequently trained student editors to either interview clinicians about implementing new workflows or gather information from written material. Information collected includes a project's impetus, team, budget, challenges, benefits, outcomes, and technology. This information is written in protocol format, stored in a publicly available online database (www.carezooming.com), and can be filtered by setting, technology used, and topic. We facilitated 30-minute phone consultations between experts whose work is featured in our database and clinicians or administrators seeking to implement a new project.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION):

1) The number of protocols featured in our database, their characteristics, and viewership statistics. 2)

Quantity of consultations completed and their perceived value. 3) Qualitative information about the student editor experience.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED):

We have collated 50 implementation protocols led by 55 innovators, spanning innovations in more than 20 cities. They have been viewed by 6000+ unique individuals across the US. The most commonly read topics were behavioral health integration, Medicare Wellness Visit workflows, and medication assisted treatment for opioid management. Most protocols utilized an EMR and had an MD team member. Budgets ranged from <\$1000 to > \$1 million. We have connected 20 innovators working on healthcare improvement through 30-minute peer consultations. Users reported the consultations saved them hundreds of dollars and hours of wasted time. Student editors reported enhanced understanding of the quality improvement process and unique exposure to healthcare implementation challenges.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?):

We demonstrated the feasibility of students collating detailed, structured information about ambulatory care improvement processes. This information has been read by clinicians and administrators across the US and served as the basis for successful peer-to-peer consultations.

DIABETES WEEK: IMPLEMENTATION OF A QUARTERLY DIABETES MANAGEMENT WEEK TO IMPROVE CARE AT A LARGE, ACADEMIC-AFFILIATED VA PRIMARY CARE CLINIC.

Stefanie Deeds^{2, 1}; Scott Hagan^{2, 1}. ¹University of Washington, Seattle, WA; ²VA Puget Sound, Seattle, WA. (Control ID #3186503)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

The Seattle VA Primary Care clinic was not meeting national quality goals for patients with diabetes, as measured by most recent hemoglobin A1c (HbA1c) 9% or an HbA1c not done in the past 12 months (HbA1c overdue).

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES):

(1) identify patient and PACT barriers and facilitators to care for veterans with diabetes (2) develop interventions to improve reduce the number of patients with HbA1cs 9% and HbA1cs overdue

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

The Seattle VA Primary Care Clinic is a large, academic affiliated clinic with roughly 3900 patients with diabetes, or 23% of the clinic patient population. Since 2011, the VA has used a medical home model, the Patient Aligned Care Team (PACT), to deliver veteran centric primary care. VA uses two main quality metrics to track diabetes care and targets <21% of patients with either an HbA1c 9% or overdue, and <5% with an HbA1c overdue. At baseline, in March 2018 the Seattle VA Primary Care clinic had 13.7% of patients with diabetes with HbA1c 9% and 10% with HbA1c overdue. A multidisciplinary workgroup including PCPs, the clinic director, clinical pharmacists, a PACT RN and trainees met monthly to review the clinical performance measures, discuss barriers to care, and develop interventions. We conducted a baseline survey and interviews of PACT teams and performed a chart review of demographic factors for patients with HbA1cs 9% and/or HbA1cs overdue to examine patient-level barriers to care. Our primary intervention was a quarterly Diabetes Week during which project leads issued PACT team reports of patients with HbA1c 9% or HbA1c overdue, tips for managing patients with uncontrolled diabetes, and information about obtaining lab work at VA community clinics. A second intervention was a pilot of sending automated lab reminder letters to all patients due for their annual HbA1c.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION):

We tracked a monthly run chart of the percentage of diabetes patients with an HbA1c s 9% and HbA1cs overdue.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED):

From March of 2018 to January 2019, the percentage of patients in our clinic with HbA1cs overdue and with HbA1c 9% declined by 20% and 5%, respectively. The key finding of staff interviews was that dedicated time for panel management is essential for success. Additionally, a common staff perception was that patient factors were a significant barrier to diabetes care. However, chart review surprisingly showed no significant differences between patients with well controlled and poorly controlled diabetes.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?):

Our diabetes working group developed a series of interventions to improve diabetes panel management, which are associated with reductions in veterans with diabetes overdue for annual HbA1c testing and with high A1cs. Forming an interdisciplinary workgroup, collecting staff and patient data on barriers to success, and using registry tools to facilitate

panel management were important factors to our success. Future directions include enhanced quarterly PACT huddles with clinic leadership and protected time for RN panel management.

DID YOU POLST TODAY? ADVANCING THE DIRECTIVES ON ADVANCE CARE PLANNING DISCUSSIONS IN RESIDENT CONTINUITY CLINICS.

Karen Jong¹; Amalia Aldredge¹; Michael A. Yu²; Sarah Koumtouzoua¹.

¹Emory University, Atlanta, GA; ²Emory University School of Medicine, Atlanta, GA. (Control ID #3184983)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Residents and attendings do not routinely have ACP discussions in primary care clinic with patients > 65, and most of those patients have never had a documented ACP discussion in the chart.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Identify barriers that prevent provider engagement, accurate documentation and appropriate billing of ACP discussions. 2. Educate providers on engagement in outpatient ACP discussions 3. Increase the percentage of patients who have had ACP discussions in the outpatient setting

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

ACP is not only a key component to resident education and training, but also a critical topic that must routinely be addressed with patients > 65 years old in order to best respect and advocate for patients wishes when they are not able to speak for themselves. We evaluated resident and attending effectiveness in completion of ACP in the Grady Green Pod Primary Care Clinic, an urban clinic serving a high risk, low resource population. Our intervention will occur in February and March during clinic "lunch-and-learn" sessions. Absent providers will complete an interactive presentation for independent, remote learning. Additional interventions include: creation of patient/provider reminder cards containing ACP information given at patient triage, printing POLST/AD packets to stock clinic drawers, and distribution of ACP billing guide to attendings.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We will measure success qualitatively through a post-intervention survey of providers evaluating their comfort with ACP discussions and knowledge of proper code status ordering, documentation of AD/POLST, and ACP billing. A retrospective chart review in April will measure the change in the percentage of patients > 65 who have had ACP discussions, along with analysis of appropriate documentation, billing and code status ordering.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A retrospective chart review of 233 established patients >65 years of age showed that only 19 (8.2%) of patients had had ACP discussions documented in our clinic; an additional 13 patients (5.6%) had discussions inpatient or in other clinics. Over half of these discussions were in patients above the age of 75. Of the 19 primary care clinic encounters, 8 were with attendings and 11 with residents. Only 2 were billed correctly and only 1 had code status ordered. Fifteen were given AD and/or POLST, but only 2 were uploaded into the chart.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Increasing incidence of engagement and accurate completion of ACP discussions requires a multifactorial approach; including,

but not limited to addressing provider knowledge gaps, making documents accessible, and using tools that remind providers and patients to address ACP. Our generalizable interventions provide a model for resident continuity clinics facing similar patient populations and barriers. Correct documentation, particularly of code status, and billing for ACP directly benefits our patients and financially supports the healthcare system providing their care.

DIRECT REFERRAL INCREASES PULMONARY FUNCTION TEST (PFT) COMPLETION RATES IN A PATIENT CENTERED MEDICAL HOME AND FINDS ALTERNATIVE DIAGNOSIS IN A THIRD OF PATIENTS WITH PREVIOUS DIAGNOSIS OF ASTHMA.

Camellia Banerjee¹; Dimple Shah¹; Christina Mai¹; Travis Halbert¹; Timothy Wigand¹; He Qiu¹; Rebecca Shafer¹; Sara Tariq¹; Jacqueline Moore¹; Huei-Wen Lim¹; Ankita Sagar². ¹Zucker School of Medicine at Northwell/Hofstra, Manhasset, NY; ²Hofstra North Shore LIJ, East Meadow, NY. (Control ID #3184685)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Because asthma is often overdiagnosed in primary care, we investigated whether asking patients with a previous diagnosis of asthma to obtain a pulmonary function test via written letter and referral may help our outpatient practice better identify patients with true asthma (or other) diagnosis.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): This intervention aimed to increase the amount of pulmonary function testing in our clinic in those diagnosed with asthma, to identify respiratory diseases and confirm asthma based on pulmonary function testing, and to tailor treatment based on new data.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

Our outpatient residency practice patients encompass an array of underserved patients with limited English proficiency, undocumented immigration status, and limited health literacy / ability to navigate the healthcare system, something that was a challenge in our intervention. Patients were drawn from our residency practice based on a diagnosis of asthma in their chart. Patients who had previously undergone pulmonary function testing were excluded. The intervention was a letter to patients explaining the importance of pulmonary function testing (PFT), basis of recommendation for such testing, and referral with directions to make an appointment for PFTs. The letter was sent in both English and Spanish.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We evaluated this intervention based on increase in testing after letter was sent. The completed pulmonary function tests were evaluated to confirm the diagnosis and treatments were changed accordingly.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 330 patients with a diagnosis of asthma were identified. Of those, 32 patients had undergone PFTs prior to the intervention. After the letter was sent, patients were followed for 6 months. In the next 6 months, 34 additional patients had undergone testing. The intervention doubled the number of patients with PFTs in our clinic. Moreover, many of the new PFTs suggested an alternative diagnosis to asthma in 32% of our patients, which allowed for our providers to discontinue unnecessary medications such as inhalers and prescribe more appropriate treatment.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our study shows that a simple intervention of sending a letter was able to successfully increase the number of PFTs in our residency clinic. Like prior studies, our intervention also showed that many of our patients with a diagnosis of asthma did not meet criteria for asthma by PFTs in 32% of the population that underwent testing. Those who were identified to have alternative diagnosis were able to be placed on more appropriate treatment, thus reducing both cost and harm in this population.

DISMANTLING A BARRIER TO MINDFUL LAB ORDERING: THE ATTENDING PHYSICIAN

Rachna Rawal¹; Paul Kunnath²; Oluwasayo Adeyemo¹; Hala Saad³; Jennifer Schmidt⁴. ¹Saint Louis University, St. Louis, MO; ²Saint Louis University School of Medicine, University City, MO; ³Saint Louis University Hospital, Saint Louis, MO; ⁴Saint Louis University, Saint Louis, MO. (Control ID #3183489)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Improve resident-attending communication regarding mindful laboratory ordering to create a high-value care culture.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Recognize the attending physician as a barrier to resident mindful laboratory ordering Identify discrepancies between attending/resident perceptions of laboratory ordering communication Understand benefits of educating attending physicians and residents on communication

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Unnecessary laboratory orders are a well-known contributor to healthcare cost. Our residents identified "fear of attending" as a barrier to more mindful lab ordering. This project focused on educating attending physicians on high-value care and promoting resident-attending ordering discussions.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Data was collected via anonymous pre and post-intervention survey (designed by study team). Participants included resident and attending physicians on the inpatient Medicine service. Multiple interventions targeting attending physicians occurred over a 16-week period including presentations at monthly hospitalist meeting (included resident lab-ordering data and resident perceptions of attendings). Electronic requests asked attendings to voluntarily submit a message of support for the project; these were then shared with residents. An attending project champion was identified and emailed attendings on service with reminders to discuss lab ordering with their teams. Surveys assessed sustainability at 6 months and 1 year.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Initially, 70% of residents reported worrying about repercussions from attendings if daily labs were not ordered; at 6 months, only 24% reported this (statistically significant, $p < 0.05$). Residents receiving "pushback" from attendings for not ordering daily labs increased from 25% to 54% (statistically significant, $p < 0.05$), sustained at 6 months. At 6 months, 71% of interns and 51% of senior residents reported receiving "pushback" from attendings. At 16 weeks, 62% of attending physicians reported residents are appropriately mindful of laboratory orders (sustained at 6 and 12 months).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our data shows a discrepancy in the perception of mindful ordering discussions between resident and attending physicians. Attendings have a higher perception of attending-initiated discussions and a lower perception of resident-initiated discussion. Interestingly, between 6 and 12-month follow-up, attendings report a decrease in resident-initiated discussions. We hypothesize that this is secondary to a new academic year or may indicate a new barrier. The increased resident-reported discussion of lab ordering has sustained through 6-months. This is further supported by the attendings perceiving the residents as being appropriately mindful of laboratory orders. However, residents have reported receiving more pushback from attendings. This may suggest that attendings are more resistant to mindful lab ordering than they perceive or may reflect increased effort by residents to change lab ordering practices. Despite pushback, fewer residents fear attendings' repercussions.

DISTANCE MAKES THE HEART GROW FONDER

Hannah Pyle; Raval R. Inja; Hiral Choksi. St. Louis University, Saint Louis, MO. (Control ID #3162430)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Why do patient's not attend their post-hospital discharge follow-up appointments?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Identify correlations of patient demographics to likelihood of attending an post hospital discharge follow-up appointment 2. Determine opportunities to create interventions to improve show rates

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A retrospective analysis was performed on adult patients admitted to SSM Saint Louis University Hospital, a 356 bed tertiary care facility between February 5, 2018 and February 28, 2018. Only patients who had follow-up appointments scheduled with Saint Louis University affiliated-physicians were included. Patient charts were accessed through our EMR to acquire demographic and follow-up appointment information. It was sought to examine the effect of multiple available predictors on appointment attendance: distance between clinic and their house, discharge location (home vs facility), length of stay, chronic comorbidities, lead time to appointment, discharge diagnosis, follow-up service, and number of follow-up appointments

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Although the dataset contained some repeated measures, a fixed model logistic regression was employed because an exceedingly small intra-class correlation coefficient indicated no violation of independence. The empirically best fit model based on AIC value via stepwise regression was identified.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The chosen model suggested two significant effects. For every additional mile in distance from the facility, the odds of attending are 2.76% higher ($p = .0248$). For every additional day of lead time, the odds of attending decrease by 1.45% ($p = .0416$). The model also suggested two marginally significant effects. Firstly, having heart disease reduces the probability of attendance by 56.18% ($p = .0795$). Secondly, having hyperlipidemia increases the probability of attendance by 262.29% ($p = .0577$).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Emphasizing and analyzing the factors that affect patient compliance with follow-up visits is critical in order to provide the best possible care. Once identified, changes can be implemented to increase patient compliance and maximize the impact the healthcare system has on patient care.

E-COMMUNICATION IMPROVES PRIMARY CARE PATIENT ACCESS TO RHEUMATOLOGY

Zachary Brandon¹; John P. Shoup¹; Robert Keenan¹; Alex H. Cho¹; Teresa K. Tarrant¹; Donna Phinney¹; John Anderson²; Elizabeth Malcolm¹; Kevin Shah¹. ¹Duke University, Durham, NC; ²Duke University Health System, Durham, NC. (Control ID #3186361)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Long wait times, poor referral completion rates, and lack of primary care provider (PCP) and specialist communication combine to prevent appropriate rheumatologic care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES):

To increase rheumatology referral completion rates and decrease wait times through implementation of E-Communication (or E-Consult). PCP and specialist satisfaction of E-Communication implementation and use were also tracked.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

Three Duke Primary Care (DPC) practices initially participated in the E-Communication program, with expansion to 2 additional practices after 6 and 8 months respectively. In lieu of traditional referrals, primary care providers place an E-Communication request. Each E-Communication is reviewed within 72hrs by a rheumatologist who provides recommendations for additional workup or treatment. The rheumatologist recommends either continued management by the primary care provider or triaged in-person rheumatologic evaluation.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): E-Communication completion rates and turnaround time were monitored. Conversion rates of E-Communication requests to in-person appointments and wait times for these appointments were tracked. E-Communications were compared with traditional referrals from all DPC clinics during the intervention period. Surveys of both primary care and rheumatology participants following the pilot program assessed participant satisfaction.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Over 12 months, 49 primary care providers submitted 230 E-Communications for 212 individual patients. 58.4% (n=124) of patients were recommended for in-person evaluation. Of these, 6% (n=8) were recommended for evaluation within 7 days, 26% (n=32) within 30 days, and 68.5% (n = 85) within 90 days or no priority. 86.5% (n=199) of E-Communications were completed within the target 72hrs (median response 15.5hrs, IQR 4.1hrs-33.5hrs). Compared to DPC patients referred to rheumatology during the same time period, E-Communication patients had shorter wait times (median 31.2d vs. 77d). E-Communication patients were significantly more likely to be scheduled (89.5% vs. 59.3%, $\chi^2 = 45.1$, $p < 0.001$) and complete their in person specialty evaluation (78.2% vs. 40.2%, $\chi^2 = 68.2$, $p < 0.001$). We found high levels of PCP satisfaction with E-Communication. When compared to standard referrals, all PCP respondents

rated E-Communications as "5- much better" (79%, n=11) or "4- somewhat better" (21%, n=3) and would recommend E-Communication to a colleague ("strongly agree" 79% n=11; "somewhat agree" 21% n=3). PCP perception of overall care coordination improved significantly post-implementation (Likert scale 1-2 negative, 3-5 neutral/positive, $\chi^2 = 19.7$, $p < 0.001$). Rheumatologists had positive experiences as well, with an overall satisfaction mean of 4.2 out of 5 on a Likert scale (IQR 4-5). Clinic level data are pending.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Through implementation of E-Communication, we improved access and increased visit completion with a high demand specialty. E-Communications were positively received by both PCPs and specialists and perceived care coordination improved.

ECONSULT UTILIZATION AND APPOINTMENT OUTCOMES DIFFER AMONG INTERNAL MEDICINE SPECIALTIES

Sharon Rikin; Eric Epstein; Matthew Berger; Anna Broder; Joann Kwah; Raphael Hulkower; Joseph Deluca; Julia H. Arnsten; Yaron Tomer. Montefiore - Albert Einstein College of Medicine, Bronx, NY. (Control ID #3174895)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Primary care patients frequently experience barriers to timely, patient-centered, and collaborative specialty care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES):

Improve primary care patient access to specialty expertise by providing a standard tool for primary care physicians (PCPs) and specialists to discuss patient care a) without the need for appointment, b) with triaging of expedited appointment, or c) in preparation for non-expedited appointment. Ensure PCP satisfaction with the intervention.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

An interdisciplinary team based in an urban, academic health system developed the eConsult workflow using the Epic electronic health record. After review of existing eConsult programs, the program was customized: eConsult was an order which PCPs could use as an alternative to routine referrals; one or two eConsultants were designated per specialty and received compensation for each eConsult; questions and responses had a free text format; responses were expected within three days. The program was piloted in three primary care sites and three specialties: endocrinology, gastroenterology, rheumatology. PCPs received on-site training about the program.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION):

eConsult program utilization was assessed by the weekly proportion of all specialty referrals (routine referrals + eConsult) initiated through eConsult using the statistical process control p chart. To evaluate the impact of the program on triaging care, appointment outcomes were assessed using descriptive statistics. These analyses were performed for all specialties combined and stratified by specialty in order to understand demand in anticipation for scaling and sustainability; chi square was used to evaluate associations between specialty and outcomes. PCP satisfaction survey was distributed after three months and evaluated using descriptive statistics.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Over seven months, a weekly average of 10% (n=160) of all specialty referral requests were initiated through eConsults with utilization differing by specialty (21% in endocrinology, 3% in

gastroenterology, 10% in rheumatology; $p < 0.001$). Among all eConsults, 19% included a recommendation for an expedited appointment and 29% for a non-expedited appointment also differing by specialty (expedited and non-expedited: 9% and 30% in endocrinology, 33% and 19% in gastroenterology, 22% and 44% in rheumatology; $p = 0.002$). The majority of PCPs (80%) were very satisfied or somewhat satisfied with eConsults compared to 30% for routine referrals.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): eConsult utilization and appointment outcomes differ by specialty with the highest use and deferral of appointments in the specialty that relies primarily on laboratory evaluation to guide management (endocrinology) rather than procedures (gastroenterology) or physical exam (rheumatology). eConsults were an effective triaging mechanism for urgent appointments. Outcomes will be used to build capacity for number of eConsultants and for the number of expedited appointments needed per week. PCP feedback will be used to promote the program and to make continuous improvements.

ECONSULTS IMPROVE PRIMARY CARE PATIENT WAIT TIMES TO SPECIALTY CARE

Ravi Budhan; Joseph Deluca; Eric Epstein; Anna Broder; Raphael Hulkower; Joann Kwah; Sharon Rikin; Montefiore - Albert Einstein College of Medicine, Bronx, NY. (Control ID #3185225)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Primary care patients face challenges to specialty care including long wait times which are associated with increased no show rates.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To decrease the wait times for specialty care and increase the proportion of completed visits by providing an alternative to routine referrals.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): An eConsult is a standardized form of communication between a primary care physician (PCP) and a specialist within the electronic medical record. From February to July 2018, the eConsult workflow was piloted among three urban, academic primary care practices which included faculty, residents and mid-level providers. The eConsult was developed as an alternative to routine referral orders for Internal Medicine specialties. eConsult orders prompted PCPs to provide a brief summary of the patient along with a clinical question. eConsultants provided recommendations within three days with three potential outcomes: no appointment needed, expedited appointment, or non-expedited appointment. If an expedited appointment was recommended, each specialty was responsible for scheduling the patient, either by overbooking or by utilizing an appointment blocked for this purpose. If a non-expedited appointment was recommended, the same workflow as routine referrals was applied.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Average wait time to specialty appointment and proportion of completed visits were compared between routine referrals and a) expedited eConsults and b) non-expedited eConsults using student t-test for means and chi-square for categorical outcomes. For routine referrals, a random sample, stratified by specialty and month was evaluated for outcome estimates.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): During the 6 month period, PCPs

requested 128 eConsults with an average wait time to initial response of 0.73 days. After the eConsult, 48.4% of patients did not require an appointment, 20.3% required expedited appointment, and 31.3% required non-expedited appointment. In this same time period, PCPs placed 994 routine referrals and 450 were sampled for estimates. For scheduled visits, the mean wait time was 29 days (SD: 32 days) for eConsult expedited, 78 days (SD: 42 days) for eConsult non-expedited, and 81 days (SD: 59 days) for routine referral (eConsult expedited vs. routine $p < 0.0001$, eConsult non-expedited vs. routine $p = 0.81$). The proportion of completed visits was 75% for eConsult expedited, 46.4% for eConsult non-expedited, and 50.5% for routine (eConsult expedited vs. routine $p = 0.02$; eConsult non-expedited vs. routine $p = 0.68$).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This eConsult intervention successfully provided a specialist recommendation in <3 business days. The majority of eConsults facilitated PCPs management of care without a need for a specialty appointment. eConsults requiring an expedited appointment had decreased wait times and a higher visit completion rate when compared to routine referrals. eConsults requiring non-expedited appointments were not different in appointment outcomes; however, based on specialist recommendations, management could start prior to the appointment.

EFFECTIVENESS OF FECAL IMMUNOCHEMICAL TESTING AS THE PRIMARY SCREENING TOOL FOR COLORECTAL CANCER IN AN AMBULATORY CARE CLINIC FOR THE UNINSURED AND UNINSURED

Maurice Marcuard¹; Edward Oldfield¹; David Mendel²; Sami G. Tahhan¹; David Johnson². ¹EVMS, Norfolk, VA; ²EVMS, NORFOLK, VA. (Control ID #3159189)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Is the fecal immunochemical test an effective colorectal cancer screening method in a clinic for the uninsured and underinsured?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) To determine the adequacy of the FIT screening program at the ACC and compliance with the core USMSTF quality measures which include: -FIT completion rate to those offered testing of 60% or greater -Proportion returning FIT that cannot be processed by the laboratory of less than 5% -Colonoscopy completion rate for those with a positive FIT of 80% or greater 2) To determine the average time to colonoscopy from positive FIT test 3) To determine the percentage of patients with a negative FIT test who undergo repeat annual FIT testing

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The US MultiSociety Task Force (USMSTF) guidelines for colorectal cancer (CRC) screening recommend either colonoscopy or annual fecal immunochemical testing (FIT) as the 1st tier screening methodologies. As a result, the Sentara Ambulatory Care Center (ACC) started using FIT testing as the preferred screening test. Importantly, the effectiveness of FIT testing is dependent on the quality of the FIT screening program and the ability to follow up positive tests with colonoscopy. This retrospective quality improvement project reviewed all ACC patients ordered for FIT testing during the first year (9/1/2016-8/31/2017) and one year of follow-up time (9/1/2017-8/31/2018). Information was obtained by chart review and included all patients ordered for a FIT test without any exclusion criteria. For patients with negative FIT testing, chart review determined if they were able to complete a follow-up FIT test

within one year. For patients with positive FIT testing, chart review determined their dates for initial appointment, scheduled and actual colonoscopy dates, and recommended follow up interval.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Descriptive statistics was used to characterize the project results to answer the above listed objectives for the project. Continuous outcomes was expressed in mean and standard deviation or median and interquartile range, depending on the distribution. Categorical outcomes was reported as count and frequency.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A total of 308 patients had a FIT test ordered during the study period (26 positive, 230 negatives, and 52 incompletes). The FIT completion rate was 83.1% (256/308). The colonoscopy completion rate for positive FIT tests was 65.4% (17/26), and all patients with a positive FIT had a surgery appointment. The average time to colonoscopy was 3.5 months in these patients. For patients with a negative FIT test, only 18% (38/207) of patients completed a follow-up FIT test within one year. Of completed tests, there were 2 FIT tests (0.7%) that could not be processed.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): -We found successful adoption of FIT testing for CRC screening with respect to an initial completion rate of 83.1% -We did not meet colonoscopy goals for positive FIT tests -There was a significant drop-off in the repeat FIT testing with only 18% of patients completing it. -This highlighted the need for a closely monitored and adjusted system for FIT testing.

EFFECTIVENESS OF NURSE-DRIVEN PROTOCOL FOR BLOOD PRESSURE MANAGEMENT

Yusuf N. Alalwan; Miriam Jaziri; Alexis C. Haftka-George; Joseph Miller. Henry Ford Hospital, Detroit, MI. (Control ID #3163465)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Is the nurse-driven protocol more effective in controlling blood pressure in patients with hypertension in the outpatient setting than the traditional physician-driven approach?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Improve blood pressure control with dedicated follow-up visits performed by nurses Improve access to health care in traditionally underserved patient populations Utilize a team-based approach in the management of chronic diseases

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The nurse-driven protocol is based on the MUPD campaign (Measure Up Pressure Down) using a team-based approach to improve blood pressure control and counteract clinical inertia in the ambulatory outpatient clinic setting. After patients are referred to the program by their physician, the MUPD nurse will follow up with the patient during cost-free appointments for blood pressure measurements, patient education, and medication titration based on a set protocol. The patients continue in the program until their blood pressures are controlled. The Henry Ford Clinics traditionally treat a disproportionately high number of medically underserved patients from the Detroit City area. The majority of the patients identify as African American.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): This was a retrospective case-

controlled study including all adults (>18 years) with hypertension (SBP >140 and/or a DBP >90) that presented to a Henry Ford internal medicine clinic between 1/2015 and 9/2017 and who participated in the nurse-driven protocol. The control consisted of a matched cohort who only followed up with their physicians. Blood pressures at 6 months and 1 year following enrollment in the nurse-driven HTN program were obtained from electronic medical records. Categorical variables were compared using chi-square tests. Crude and adjusted odds ratios were obtained using generalized estimating equations with a logit link function presence of blood pressure control as the dependent variable.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The rate of controlled blood pressure (BP) at 6 months is significantly higher in patients who were in the program as compared to those who were not (61% versus 45%, p<0.001). Similarly, the rate of medical management change was significantly higher in patients who were in the program as compared to those who were not (30% versus 21%, p<0.001). However, for both endpoints, the rates were similar at all other time points. Patients with at least 1 MUPD visit had 1.46 times the odds of having controlled BP in later visits compared to those with no MUPD visits. When controlling for gender, race, baseline systolic BP, and ratio of the medication change, patients with at least one MUPD have 1.48 times the odds of having controlled BP in later visits compared to those with no MUPD visits.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Nurse-driven clinic visits seem to be more effective in controlling blood pressures in the primary care setting than traditional physician visits. This project furthermore showed that this is also true in outpatient settings with a high proportion of underserved patients with multiple other comorbidities and complex social backgrounds.

EFFECTS OF A COLLABORATIVE FRAMEWORK FOR CHRONIC PAIN MANAGEMENT AT ROSEBUD INDIAN HEALTH SERVICE UNIT

Stephanie Sun; Hannah Wenger. Massachusetts General Hospital, Boston, MA. (Control ID #3185879)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): How does the initiation of a committee-based framework affect chronic pain management at Rosebud Indian Health Service (IHS) Unit in rural South Dakota?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The pain committee is intended to: (1) streamline safe opioid prescribing at Rosebud IHS Unit, (2) improve chronic pain management as guided by its outpatient providers, and (3) create a collaborative environment for outpatient providers to discuss chronic pain patients.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Rosebud IHS Unit is a rural community-based site on Rosebud Indian Reservation in South Dakota. Its clinical staff launched a pain committee in October 2018 to create a framework for managing patients with chronic pain, including those receiving long-term opioids. Primary care providers first place a pain consult in the electronic record, and then the primary care provider discusses the case and receives recommendations for pain management at the weekly committee meeting, which includes providers and representatives from administration, pharmacy, behavioral health, and other support services in the hospital.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Opioid prescribing will be compared between two major time periods: before and after initiation of the pain committee. We will assess total dispensed morphine milligram equivalents (MMEs) per month and average dispensed MMEs per chronic pain patient per month; we will stratify data based on buprenorphine prescribing. We will also determine the number of pain consults placed per month. PEG scores will be collected for all chronic pain patients, and their scores will be assessed before and after completion of the pain consultation. We will collect qualitative data by surveying providers about the implementation of the pain committee.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Since initiation of the pain committee in October 2018, total dispensed MMEs/month has been stable while total dispensed MMEs/month excluding buprenorphine has decreased. We do not currently have data to report on patient and provider endpoints.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This framework for improving the safety and quality of chronic pain management is applicable to other clinical sites in rural and non-rural settings and can be implemented with minimal support staff.

EFFECTS OF A COMMUNITY BASED COLLABORATIVE DIABETES CONTROL AND PREVENTION PROGRAM FOR LOW-INCOME OVERWEIGHT AND OBESE PATIENTS IN A SUBURBAN POPULATION- A PILOT STUDY

Claudia L. Campos¹; Deepak Palakshappa⁴; Carolyn F. Pedley⁵; Feben Girma³; James L. Wofford⁶; Kirsten Feiereisel^{7, 1}; Constance Poe⁸; Melanie Martin². ¹Wake Forest University, Winston-Salem, NC; ²Wake Forest, Greensboro, NC; ³Wake Forest Baptist Medical Center, Winston-Salem, NC; ⁴Wake Forest School of Medicine, WINSTON SALEM, NC; ⁵Wake Forest, Winston-Salem, NC; ⁶Wake Forest School of Medicine, Winston-Salem, NC; ⁷Wake Forest University School of Medicine, Winston-Salem, NC; ⁸YWCA, Winston Salem, NC. (Control ID #3159774)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): With the growing obesity crisis in the US, more adults develop diabetes and its complications. Community organizations and health care systems have begun collaborating to reduce diabetes development and improve glucose control. Linking patients' at higher risk of developing diabetes with community evidence-based behavioral weight loss interventions modeled after the National Diabetes Prevention Program (DPP) have been successful in decreasing glucose levels and weight in randomized clinical trials settings.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Given this context, the goal of this study was to evaluate the effects of a DPP based program offered by the Winston Salem, NC YWCA, for low income, obese patients with diabetes or pre-diabetes.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The YWCA enrolled participants from September 2016 through January 2018. Participants were eligible if they had a hemoglobin A1c (HbA1c) 5.7 and a Body Mass Index (BMI) 25. They also had to be English speaking and either have Medicaid insurance or income under 200% of the Federal Poverty level. A primary care physician from a preselected academic medicine or community practices referred participants to the YWCA program. The program included the following key features: 1) individual case managers or "lifestyle coaches;" 2) frequent contact with participants; 3) a structured, state-of-the-art, 16-

session core-curriculum that taught behavioral self-management strategies for weight loss and physical activity; 4) supervised physical activity sessions; 5) a more flexible maintenance intervention, combining group and individual approaches.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Primary outcomes were change at 9 months in Mean BMI, HbA1c, and health scores (HRA) as well as percentages of participants who lowered their BMI and HbA1c after the intervention.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): As of October 2018, 39 patients completed 9 months or more of the program intervention. Participant characteristics on enrollment were as follows: Race majority AA (36/39), graduated high school (28/39), Mean age 59.5 years (range 46-78), HbA1c 7.8 (range 5.7- 13.4), BMI 41.2 (range 27.3-75), HRA score 56 (range 39-75). At 9 months, participants' Mean Hb A1c decreased to 6.7 (-1.1, p<0.001) and Mean BMI to 40.3 (-0.9, p= 0.007). 67% (26/39) and 82% (32/39) participants achieved reductions in BMI and in Hb A1c respectively. Mean HRA increased to 61 (+5, p= 0.009).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): After 9 months of participation, the glucose lowering and health score improvement effect of the collaborative YWCA program for low-income obese patients with prediabetes or diabetes was significant. Its effect on BMI was smaller and not statistically significant. The majority of participants lost weight and lowered their glucose levels. The findings suggest that achieving blood glucose and weight reduction in a real world setting parallel those achieved in the research settings.

EMERGENCY DEPARTMENT USE AMONG PATIENTS WITH MENTAL HEALTH CHIEF COMPLAINTS

Ana Sofia Warner¹; Trina Chang^{2, 1}; Jason H. Wasfy¹; Dellara Terry². ¹Massachusetts General Hospital, Boston, MA; ²Partners HealthCare, Boston, MA. (Control ID #3185791)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can we identify characteristics of frequent emergency department (ED) visitors with mental health comorbidities in order to improve population health-based mental health initiatives and reduce emergency department utilization?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Identify patients who frequently visit the ED who have one or more mental health chief complaints associated with an ED visit during a defined time period. 2. Identify characteristics associated with frequent ED visits, such as insurance status, and enrollment in a care management program. 3. Use this data to inform existing mental health initiatives to improve ambulatory care and reduce ED utilization.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Partners Population Health (PHM) is responsible for population health initiatives that span the Partners HealthCare System (PHS) network, including a high-risk care management program and mental health initiatives. Using clinical and claims data, PHM identifies frequent visitors as patients who have 2 or more inpatient and/or emergency department visits in a 11 month period, and uses this data to assess for utilization trends and opportunities for care improvement.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Reduction in the average number of ED visits among frequent visitors with 1 or more mental health discharge diagnoses. 2. Reduction in the average number of patients who present to the ED with a mental health chief complaint and are not admitted.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In August 2018 13,356 patients were identified as frequent ED visitors within the associated 11 month period. 1098 of these patients had at least one ED visit associated with an ICD code that contained one or more of the following diagnoses: anxiety or panic, depression, intentional self-harm, adjustment disorder, alcohol, bipolar or schizoaffective or manic disorder, personality disorder, psychosis or schizophrenia, substance use and suicidal ideation. This subgroup was more likely than their peers without these diagnoses to be male (51% vs. 40%, p < 0.005), have Medicaid (29% vs. 25%, p < 0.005) or commercial insurance (43% vs. 38%, p < 0.005), and be younger (average age 44 vs. 53, p < 0.005). They were less likely to be in a high-risk care management program (15% vs. 17%, p < 0.05). They also had more ED visits on weekends (average 0.72 vs 0.60, p < 0.005) and after hours (average 0.77 vs 0.68, p < 0.005) that did not result in a hospital admission. In the 11 month period they had more ED visits than their peers with no mental health chief complaint (average 3.19 vs. 2.28, p < 0.05) but no difference in the number of inpatient stays (average 0.63 vs 0.66, p = 0.521).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Other health systems may be able to similarly assess for differences in ED utilization among patients with mental health chief complaints. In particular, other systems can consider investigating alternatives to ED care for patients with urgent mental health needs, and/or expanding care management programs to include more patients with mental health disorders in order to reduce ED utilization among this population.

ESTABLISHING AN ORTHOPEDICS OBSERVATION UNIT - A NOVEL STRATEGY FOR CONTINUITY OF ORTHOPEDIC CO-MANAGEMENT

Frances J. Mao²; Sonia Siu¹; Eric L. Hume³; Michele Fang¹. ¹University of Pennsylvania, Wynnewood, PA; ²University of Pennsylvania, Philadelphia, PA; ³Perelman School Medicine, U Pennsylvania, Philadelphia, PA. (Control ID #3186429)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Hospitalists play a key role in orthopedic co-management during the peri- and post-operative period by providing guidance on common internal medicine issues; therefore, we sought to extend hospitalist support after hospital discharge by establishing an orthopedics observation unit for the care of total joint arthroplasty patients.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Objective 1: To develop standard evidence based protocols for common postoperative problems to standardize care and avoid unnecessary tests. Objective 2: To develop an orthopedic observation unit where patients fitting criteria can receive expedited and standard treatment with their orthopedic and comanagement teams. Objective 3: To measure the outcomes of an orthopedic observation unit on length of stay, readmission rates, and complications.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): In October 2017, we established a hospital based orthopedics observation unit

that included patients who underwent total knee arthroplasty (TKA), total hip arthroplasty (THA), revision TKA, and revision THA within the past 90 days. We developed evidence-based interdisciplinary protocols in conjunction with orthopedic surgery and emergency medicine for the work-up of fever, shortness of breath, anemia, and joint dislocation. Patients were triaged to the appropriate service (orthopedics observation, orthopedics inpatient, hospitalist observation, or hospitalist inpatient) based on acuity of illness and anticipated length of stay.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We will collect data metrics agreed upon by key stakeholders, including length of stay, readmission rate, complication rate, and mortality. Measures of success will focus on the number of patients who were able to be discharged on observation status (<48 hours) without complications or readmissions.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Preliminary data shows that approximately 17 patients were admitted under orthopedics observation status, of which joint dislocation (n=5, 29.4%), infection (n=3, 17.6%) and urinary tract infection or retention (n=3, 17.6%) were the most common complaints. These patients were able to be discharged to home or skilled nursing facility without increase in complication. Also, traditionally the majority of these patients would have been admitted to general medicine services thereby disrupting continuity of care.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Orthopedic observation units may decrease readmissions, streamline care, and improve continuity of care for total joint replacement patients. There is no added cost to such a program, and these programs may become more common especially with bundled payments. Close communication with general internists, orthopedics, emergency medicine, and social work is necessary for successful implementation of orthopedic observation units. Further studies will need to be conducted to see if orthopedic observation units will improve outcomes and decrease costs.

EVALUATING THE IMPACT OF A MULTIDISCIPLINARY GASTROINTESTINAL MALIGNANCY CLINIC ON THE DELIVERY OF CARE AT THE DALLAS VA MEDICAL CENTER

Namrah Siddiq¹; Monicah Gichinga²; Sanjai Sabu⁴; Thai H. Pham³; David Wang¹. ¹University of Texas Southwestern Medical Center, Dallas, TX; ²Dallas VA Medical Center, Dallas, TX; ³North Texas Dallas Veterans Affairs Medical Center, Dallas, TX; ⁴University of Texas Medical Branch, Galveston, TX. (Control ID #3180921)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can a biweekly Multidisciplinary Gastrointestinal Malignancy Clinic (MGMC) reduce the time from diagnosis to initiation of definitive treatment in patients with gastrointestinal cancer?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): -To reduce the time between oncologic consult and first definitive therapy in patients with gastrointestinal cancer -To reduce the time between diagnosis and first definitive therapy in patients with gastrointestinal cancer -To improve the efficiency in which patients with gastrointestinal cancer complete their staging following diagnosis

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The outpatient MGMC was established at the Dallas VA in 2016. Prior to the

MGMC, patients presented to their primary care physicians (PCPs), who once a malignancy was biopsy confirmed would consult an oncologic specialist. Patients requiring multidisciplinary oncologic care would then have up to three separate appointments (medical, surgical, and radiation oncology) scheduled on separate days. With the creation of the MGMC, however, clinicians from all required oncologic specialties evaluate a patient in a single clinic on a given day and a definitive therapy course is planned.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Patients seen in the MGMC were matched to patient controls (seen in the prior 2 years before the MGMC was established) by pathologic diagnosis and stage. The primary endpoint was time between the initial oncologic consult and first definitive therapy. Secondary endpoints were time from biopsy to first definitive therapy and time from biopsy to completion of staging. The average times for each endpoint for these two groups were then evaluated statistically.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 40 patient cases (with 40 available matched controls) were seen in the MGMC from July 2016-June 2018. A statistically significant reduction in the average time between initial oncologic consult to the time of first definitive therapy was found in favor of patients seen in the MGMC (44.3 ± 20.5 days vs 60.7 ± 41.4 days). The average time from biopsy to first definitive therapy was not found to be significantly different between patient groups. The average time from biopsy to completion of staging was significantly reduced in the MGMC group (31.4 ± 33.1 days vs 53.2 ± 40.5 days).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The establishment of a Multidisciplinary Gastrointestinal Malignancy Clinic allowed cancer patients to meet with various oncology specialists in a single setting and for oncology providers to decide upon an initial consensus treatment plan, resulting in a reduced time between initial consult and first definitive treatment. Staging was also completed more efficiently in patients seen in the multidisciplinary clinic. These results suggest that a multidisciplinary oncology clinic enhances delivery of care in newly diagnosed cancer patients.

EVALUATION OF AN INTERVENTION SUPPORTING GUIDELINE-CORDONANT, PATIENT-CENTERED CARE FOR PATIENTS ON CHRONIC OPIOIDS

Joel Sawady^{2, 6}; Emily Hanson²; Esther Cazeau⁴; KATHERINE Y. COLON⁵; Michael Flores^{4, 3}; Yanyi Jiang^{4, 3}; Brian Mullin^{4, 3}; Ana M. Progovac^{4, 3}; Lynne A. Seeley¹; Kathleen Thelen⁵; Benjamin Cook^{4, 3}. ¹Cambridge Health Alliance, Cambridge, MA; ²Cambridge Health Alliance, Brighton, MA; ³Harvard Medical School/Health Equity Research Lab, Cambridge, MA; ⁴Cambridge Health Alliance, Cambridge, MA; ⁵Cambridge Health Alliance, Medford, MA; ⁶Harvard Medical School, Cambridge, MA. (Control ID #3178624)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): New regulations and guidelines have increased the burden on clinicians caring for patients on long-term opioid therapy (LTOT), compounding the challenge of providing patient-centered care for this vulnerable population

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Support clinicians in providing regulation- and guideline-concordant care for patients on LTOT through improved EHR tools and staff support 2. Educate clinicians on best practices for legacy patients already on LTOT 3. Support clinicians in a patient-centered approach to reducing high-risk prescribing

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Cambridge Family Health (CFH) is a primary care practice within the Cambridge Health Alliance (CHA), a safety-net institution caring for a diverse patient population, with a high burden of psychiatric illness, substance use disorders, and chronic pain. LTOT for chronic pain has become more complex due to: 1. New regulations and evolving best practices, including mandated counseling, prescription monitoring program (PMP) use, controlled substance agreements (CSAs), and urine drug screens (UDSs) 2. Team-based care leading to a need for structured coverage arrangements In response, our multidisciplinary team reviewed relevant regulations, created clinician guidance, and developed workflows to support that guidance. The intervention included: 1. Regulatory- and guideline-concordant EHR documentation 2. Staff-supported workflows to check the PMP, ensure CSAs are in place, and obtain UDSs 3. Clinician education We hypothesized that educating clinicians and reducing administrative burden would remove barriers to individualized treatment and improve care.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Patients on LTOT receiving care at CFH (N=257; intervention group) were compared with patients on LTOT receiving care at all other CHA clinics (N=1680; comparison group). We evaluated changes between 2015 and 2018 in: 1. Proportion of patients receiving UDSs 2. Rate of co-prescription of benzodiazepine and opioids 3. Rate of discontinuation of opioids 4. Proportion of patients on high-dose opioids We conducted a difference-in-differences analysis comparing changes in the intervention group to changes in the control group, adjusting for relevant covariates. Additional analyses were done on a subset of patients on high-dose LTOT (intervention=41, control=212).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Compared to the comparison group, patients in the CFH intervention had a significantly greater increase in use of UDSs ($D-D = +8.27\%$; $p<.05$); a significantly greater decrease in co-prescription of benzodiazepines ($D-D = -15.9\%$; $p<.05$); but no statistically significant change in discontinuation of opioids. Results of D-D analysis were consistent for both unadjusted and adjusted analysis. Controlling for covariates, there was a statistically significant difference in the proportion of patients on high-dose opioids between treatment and comparison groups at the end of the intervention ($=-.20$ $p<.05$).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): An intervention supporting guideline-concordant care for patients with LTOT shows promise in improving care, particularly for patients on high-dose opioids

EXPANDING ACCESS TO INTRANASAL NALOXONE FOR HIGH RISK PATIENTS UPON HOSPITAL DISCHARGE

Erica Tavares; Rutwij K. Joshi. Massachusetts General Hospital, Boston, MA. (Control ID #3186346)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): There is no clearly defined process for providing intranasal naloxone for eligible patients being discharged from their inpatient stay at Massachusetts General Hospital.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): A pharmacist driven pilot program was performed on an internal medicine and oncology unit with the objectives of increasing

hospital provider awareness of high risk candidates and providing access to intranasal naloxone at discharge for these individuals.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The pharmacist driven protocol on an internal medicine and oncology inpatient unit involved the daily screening of patients meeting criteria for high risk of opioid overdose. Criteria included patients taking 50 mg or greater per day of morphine equivalents, or patients with active or a history of opioid use disorder and those on opioid withdrawal agents. Responding clinicians would then be alerted by the pharmacist of their high-risk patients and naloxone would then be recommended upon discharge. Upon agreement with the responding clinician, the patient would then be seen by the pharmacist, who would counsel them on the signs and symptoms, and risks of opioid overdose. They would then be asked if they would like a prescription for intranasal naloxone upon discharge. If the patient agreed, the pharmacist would write the order and deliver the medication to the patient while still inpatient, to ensure that they left with the medication in hand at discharge. This initiative took place from December 15, 2017 until February 15, 2018.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The percentage of eligible patients discharged with intranasal naloxone from this inpatient unit were measured before and after the initiative took place.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The percentage of eligible patients discharged on intranasal naloxone increased from an average of 13% to 28% from December 15, 2017 to January 15, 2018

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This pilot was successful in increasing access to intranasal naloxone to high risk patients upon discharge. The modest percentage increase may be due to limited outpatient pharmacy hours, evening or weekend discharges, and the availability of a pharmacist to counsel patients on naloxone before patients are discharged. Areas for improvement and expansion included a collaborative practice agreement for trained pharmacists in opioid use disorder to prescribe intranasal naloxone upon discharge.

FEASIBILITY OF IMPLEMENTING A 24-HOUR AMBULATORY BLOOD PRESSURE MONITORING (ABPM) TESTING SERVICE INTO PRIMARY CARE

Nadia Liyanage-Don¹; Nathalie Moise¹; Kristal Quispe²; Jennifer Mizhquiri Barbecho²; Hye Gi Shim¹; Ian M. Kronish¹. ¹Columbia University Medical Center, New York, NY; ²Columbia University Medical Center, Brooklyn, NY. (Control ID #3181226)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): In 2015 the USPSTF updated their hypertension screening guidelines to recommend that patients with elevated office BP undergo ABPM to confirm the diagnosis of hypertension and exclude white coat hypertension (WCH) (grade A). However, ABPM is infrequently used in primary care due to lack of accessibility, concerns about patients' ability to complete testing, and inadequate reimbursement. We aimed to assess the feasibility and economic viability of an ABPM testing service offered within a primary care network.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To increase the use of 24-hour ABPM as part of hypertension screening and diagnosis in a primary care network serving a vulnerable patient population. 2. To increase the identification of WCH in

primary care. 3. To determine the financial sustainability of a 24-hour ABPM testing service with a predominantly publicly insured payor mix.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): ActiveBP is a 24-hour ABPM testing service launched in 2015 at Columbia University Irving Medical Center. Previously, ABPM was only available on campus through referrals to nephrology for patients with kidney disease. ActiveBP offers ABPM testing to patients within the primary care network who have elevated office BP but no diagnosis of hypertension, the only Medicaid/Medicare reimbursable condition. Key features of ActiveBP include an order set within the electronic health record, patient- and provider-friendly ABPM reports, bilingual coordinators for scheduling and device placement, and provider education about ABPM testing availability through presentations and newsletters.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): BP values from ActiveBP were compared to office BP values from the electronic health record to classify patients as having sustained hypertension (office BP 140/90 mmHg, mean awake BP 135/85 mmHg) or WCH (office BP 140/90 mmHg, mean awake BP <135/85 mmHg). Success metrics included the volume of patients referred for ABPM, rates of ABPM completion (defined as 10 awake BP readings), patient and provider satisfaction, and economic viability (revenue versus costs).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Between September 2015 and June 2018, 436 primary care patients were referred for ABPM, of which 256 initiated testing and 246 (95%) completed testing with sufficient readings. Of patients with sufficient readings, 123 (50%) were found to have WCH. Patient surveys showed high satisfaction with the testing service. Focus groups to assess provider satisfaction are currently being planned. Economic analysis showed that, including staff time and overhead, cost per test was \$200 whereas Medicaid/Medicare reimbursement per test was \$62.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): An ABPM testing service can successfully conduct ABPM in primary care patients and can identify WCH in about half of patients referred. However, with a payor mix comprised of primarily Medicaid/Medicare recipients, reimbursement is insufficient to cover costs. Conducting ABPM testing within the primary care clinic or offering the service to a broader mix of publicly and commercially insured patients may be needed for such testing to be economically viable.

FINANCIAL INCENTIVES FOR MEDICAL ASSISTANTS AS PANEL MANAGERS TO IMPROVE COLORECTAL CANCER SCREENING RATES IN A LARGE, URBAN, ACADEMIC PRIMARY CARE MEDICAL GROUP

Laura J. Zimmermann¹; Michael Hanak¹; Tim Reiff²; Aaron Shultz¹; Daniel Dunham¹. ¹Rush University Medical Center, Chicago, IL; ²Rush University Medical Center, Oak Park, IL. (Control ID #3173540)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Cancer screening is becoming increasingly important for financial viability of primary care practices as health systems transition into performance-based payer contracts. As of October 28th, 2018, only 65.93% of eligible primary care patients were screened for colorectal cancer (CRC) in this large, urban, academic medical group (eCQM CMS-130v5).

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Increase CRC screening rate from 65.93% to the HEDIS top decile target of 72% by December 31, 2018, at which time financial incentives for the health system will be determined per payer contracts.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): In addition to evidence-based interventions for improving CRC screening rates (clinical detailing, offering stool-based testing, patient reminder letters and electronic messages, PCP audit-and-feedback, and patient navigation), we offered medical assistants (MAs) in 9 of 13 primary care clinics a financial incentive of \$400 if their respective clinic achieved a CRC screening rate of 72%. MAs in all 13 clinics were trained to utilize an electronic health record report to call overdue patients to 1) document outside results, 2) transfer patients with existing orders to colonoscopy schedulers, or 3) schedule a visit with the PCP to discuss CRC screening. Setting: 13 urban primary care clinics with 69 PCPs totaling approximately 90,000 patient visits per year and 6,904 patients overdue for CRC screening as of October 28th, 2018.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We compared CRC screening rates at the provider-, clinic-, and medical-group level on October 28th, 2018 (prior to announcing MA financial incentives), and December 31st, 2018. To determine the relative impact of MA financial incentives, we compared the percentage of overdue patients screened and the change in screening rates in the clinics in which MAs were incentivized compared to clinics in which MAs were not incentivized.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): As of December 31st, 2018, these 13 primary care clinics screened an additional 1,532 patients totalling 14,895 of 21,317 eligible patients (69.87%), an improvement of 3.94% in this time period. Sixty of 69 physicians (86.96%) improved (range -1.34% to +13.53%). Twelve of the 13 clinics (92.31%) improved (mean 3.12%, range -0.17% to 5.21%). A total of 22 MAs received the financial incentive in 5 of 13 clinics. Clinics that incentivized MAs screened a larger percentage of overdue patients (mean 14.18%, range 7.06% to 20.60%) compared to those that did not (mean 5.13%, range 2.38% to 8.33%). Clinics that incentivized MAs also generally achieved greater improvement in CRC screening rates (mean 3.63%, range 1.59% to 5.21%) compared to those that did not (mean 1.93%, range -0.17% to 4.17%).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): As reimbursement models evolve to promote value-based care, health systems will need to utilize healthcare team members to improve quality and avoid PCP burnout. We demonstrated that a large medical group can leverage primary care MAs as panel managers to address care gaps and perform outreach, and the use of modest financial incentives can confer additional improvement in CRC screening rates.

FINDING NEEDLES IN THE EHR HAYSTACK: DESIGN AND EARLY RESULTS FOR A NATURAL LANGUAGE PROCESSING MODEL TO IDENTIFY CLINICAL NOTES RELEVANT TO A PATIENT'S GOALS OF CARE

Azalea Kim¹; Allison Dunning²; Shelley Rusincovitch²; Andrew Olson²; Julie Childers¹; Erich Huang²; Ursula A. Rogers²; Brian Griffith¹; Lawrence A. Mumma¹; Qi Liu²; Matias Benitez²; Jared Lowe¹; Ricardo Henao²; David Casarett¹. ¹Duke University Health System, Durham, NC; ²Duke University, Durham, NC. (Control ID #3184334)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Evidence of goals of care (GOC) conversations between patients and providers are scattered throughout the EHR as free text in clinical notes, making it difficult and time-intensive for providers to find.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Describe extent to which GOC-relevant data are scattered throughout the EHR as free text in notes Leverage an integrated clinical and quantitative health data science team to develop a data science model that uses natural language processing (NLP) and machine learning methods to identify notes that contain GOC-relevant data

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We assembled a health data science team with quantitative and clinical members from primary care, hospital medicine, and palliative care experienced in GOC conversations. The data set included ~5.3 million clinical notes for 97,402 beneficiaries in Duke's Medicare ACO between 2015-2017. Since there's no "gold standard" to define a GOC-relevant note, we drew from palliative care and advance care planning notes and personal experience to create 3 categories to identify GOC-relevant notes: 1. Surrogate decision makers; 2. Goals and values; 3. Care preferences. Clinical members identified 51 key phrases within those categories, and quantitative team members wrote them into regular expressions (regex) to search for these phrases.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Use regex to analyze clinical notes and their distribution for GOC-relevant data in an ACO population Develop a consensus-driven standard to identify GOC-relevant notes to train an NLP machine learning algorithm

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We evaluated characteristics of regex phrases associated with GOC classifications and their distribution across notes. On average, regex phrases appeared once or twice within the same note, and a single note typically only matched one regex phrase, with maximum 45 matches within a single note. Regex alone are inadequate to identify GOC-relevant notes. Templated notes contributed heavily to this problem. We performed an iterative series of paired clinical note reviews on random samples of notes selected via regex labels that informed our approach to a large scale note adjudication process to train an NLP machine learning algorithm. We then developed a consensus-driven standard to identify notes relevant to real-time GOC discussions. Clinical members are currently labeling ~1,000 clinical notes as being relevant or not to a real-time GOC discussion, with an additional tag for particularly relevant notes.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our analysis confirmed suspicions that GOC data are scattered within a sea of notes within the EHR. From a data science perspective, the lack of a "gold standard" to define GOC relevance is a formidable challenge, but we used our experiences to design a clinically relevant endpoint. Eventually the model will be deployed as a point-of-care tool that displays high probability GOC-relevant notes. Our design and approach could be generalizable to other organizations, and may inform approaches to other nuanced areas of clinical care where data is captured in notes, and a gold standard similarly may not exist.

FIT VS COLONOSCOPY: A SHARED DECISION MAKING WORKSHOP TO OPTIMIZE COLORECTAL CANCER SCREENING IN AN URBAN UNDERSERVED POPULATION

Denis Yusupov^{1, 2}; Jordonna Brown^{1, 2}; Christon Grant^{1, 2}; Nikita Gupta^{1, 2}; Gayatri Malhotra-Gupta^{1, 2}; Michelle Likhtshteyn^{1, 2}; Melissa S. Lee^{1, 2}; David L. Stevens^{1, 2}; Andrew A. Chang^{1, 2}. ¹NYC Health + Hospitals/Kings County, New York, NY; ²SUNY Downstate Medical Center, Brooklyn, NY. (Control ID #3186050)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Will a resident run workshop on shared decision making (SDM) improve colorectal cancer (CRC) screening completion rates in an underserved population?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To optimize CRC screening completion of FIT vs colonoscopy through SDM in an urban underserved population.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A retrospective analysis reviewed colon cancer screening rates in average risk patients, as per the U.S. Preventive Services Task Force (USPSTF) guidelines, in an urban underserved resident primary care practice between January and February 2017. The intervention was a resident-run SDM 3-hour workshop using lecture, worksheets, and group practice to teach residents patient-centered CRC screening. A prospective cohort study reviewed charts from August 28th to October 24th, 2018 to assess completion of screening.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Overall CRC screening test ordering and completion rates, pre- and post-intervention, were assessed for eligible patients. A subgroup analysis of fecal immunochemical testing (FIT) and colonoscopy completion rates was also performed.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): At baseline, 52 patient charts reviewed 9 (17%) FIT test ordered, 78% completion rate 43 (82%) colonoscopies ordered, 26% completion rate Overall baseline completion rate: 34% Post-intervention: 45 patient charts reviewed 22 (48%) FIT chosen, 59% completion rate 23 (52%) colonoscopies chosen, 43.4% completion rate Overall post-intervention completion rate: 51% There is a 17% difference ($p=0.092$, 2 proportion test, trending but not statistically significant) from baseline overall completion rate, however there was statistical significance in patient choice of test after the workshop ($p=0.0011$). **KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?):** Although CRC is the third most common cancer among men and women and is projected to cause more than 50,000 deaths in 2017, only 62.6% of adults 50 years and older were screened (CDC, 2015). Access, insurance/immigration status, education, burden of preparation and ethnicity impact cancer screening. Urban underserved populations are disproportionately affected by these barriers. This study demonstrates that improving SDM between patients and providers can decrease barriers and improve CRC screening. An efficient resident-led curriculum can be easily integrated into a residency schedule. Though the completion rates only trended towards statistical significance, there was a clear difference in tests ordered, reflecting that SDM influences choice of screening method. While SDM improved the show rate for colonoscopy, the no-show rate remained high. Further investigation on patients' reasons for not completing their colonoscopy is a possible area for future investigation.

FOOD AS MEDICINE: MEDICAL NUTRITION THERAPY FOR PATIENTS LIVING WITH DIABETES

manjeet bhamra^{2, 1}; Muhammad afzal Khan^{2, 1}; Jonathan Francois^{2, 1}; duarxy R. sainvilien^{2, 1}; Marlee Ickowicz²; Andrew A. Chang^{2, 1}; Melissa S. Lee^{2, 1}.

¹SUNY Downstate, New York, NY; ²NYC Health + Hospitals/Kings County, New York, NY. (Control ID #3185715)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Despite best practice recommendations from the American Diabetes Association, only 20% of patients living with diabetes at our urban, inner city Internal Medicine resident practice have received medical nutrition therapy (MNT).

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To engage the clinical care team in recognizing and referring eligible patients for MNT To increase access to MNT by integrating services into the primary care visit during non-value added time

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

The East New York (ENY) Diagnostic and Treatment Center, with a diabetes control rate of 59% ($HbA1c < 8$), is the lowest performer in the NYCH+H system. Despite having a certified registered dietitian on-site, 80% of patients living with diabetes have not received MNT. Our intervention was designed to address this gap in care. Records of diabetic patients ($HbA1c > 6.5$) seen in the practice from July to August 2018 were reviewed to identify those who had received MNT within 3 months of their last monitored $HbA1c$. 30% eligible patients were referred for MNT. 68% of those referred completed MNT. A multidisciplinary, collaborative discussion with clinicians, medical assistants, nurses, and our registered dietitian confirmed these findings. Using a team-based approach, we sought to engage patients in MNT during their primary care visit. Performance data and clinical guidelines were shared with the clinical team. Medical Assistants (MA) identified patients with diabetes who did not receive MNT within 3 months of their last $HbA1c$. MA initiated the MNT referral while patients were waiting to see their primary care provider (PCP).

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): To increase the number of MNT referrals and completed MNT visits for diabetic patients by 5% from a baseline of 30% and 68% respectively.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): During the post-intervention study period from October to November 2018, 51% patients living with diabetes were referred for MNT. MNT completion rate, 68% prior to the intervention, was 70% after the intervention, essentially unchanged.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): High rates of uncontrolled diabetes in our patient population necessitate creative team-based clinical interventions to help close gaps in care. Engaging MA in identifying patients living with diabetes who had not received MNT proved an effective way of increasing referrals for diabetes self-management education compared with PCP referral alone. Same-day access to MNT, and a seamless transition from MNT to primary care visits did not impact the percent of completed MNT sessions. Future studies should include the voice of the patient to better understand barriers to integrating MNT into routine care.

FOOD FOR THOUGHT: CREATING ACCESSIBLE FOOD PHARMACIES FOR AT-RISK POPULATIONS

Divya Venkat¹; Veli Bakalov¹; Herman Singh³; Courtney Watson²; Colleen Ereditario²; Bruce Ling²; Elizabeth Cuevas^{2, 1}. ¹Allegheny General Hospital, Pittsburgh, PA; ²Center for Inclusion Health, Pittsburgh, PA; ³Allegheny Health Network, Pittsburgh, PA. (Control ID #3183890)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Approximately 47% of the population in Pittsburgh experiences difficulty accessing food and has the fourth highest rate of obesity in America.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To improve access to healthy foods in low income populations

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Healthy Food Center was implemented due to a need for food banks for an obese and medically complex population. Through this program, patients receive a referral from a provider and can visit the healthy food center. On-site, a registered dietitian tailors each patient's nutrition plan to their comorbid conditions. The food bank provides fresh vegetables, fruits and low sodium goods. Patients are then given 2-3 days worth of food based on family size. From here, patients are given resources to food pantries and boxed food programs. Additionally, patients are given directions on how to shop on a budget and tips on healthy cooking. Patients are also provided with help on completing forms for food assistance programs as needed.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Success of this intervention is based on the determination of whether visiting patients had weight loss, change in BMI or HbA1c level.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A total of 137 were referred over the period of May 2018 to November 2018. This study included 55 patients with three-month follow up appointment. A majority of patients were females (98(71.5%)) and 90 (65.7%) patients had households less than 2 people. Our patients were referred from diabetic center (37.2%), in network PCP (21.9%) and bariatric center (10.2%). 66.7% had diabetes, 49.6% had hyperlipidemia, 50.3% hypertension, 8.8% kidney disease, 8.8% with heart disease. 22.6% of the patients followed low sodium diet, 30.7% met with dietitian and 33.6% were involved in weight management. Mean BMI at baseline was 36.5 and 35.9 at three month follow up. The majority of patients (40(72.7%)) had a BMI above 30. Among our patients, 33 (60.0%) patients had a 1.7 decrease in BMI and 22 (40.0%) patients had 0.7 increase in BMI. Mean weight at baseline was 232.1 pounds and at three months follow up mean weight was 234.6 pounds. Average weight loss was 7.7 pounds and was seen in 30 (54.5%) patients, while 25 (45.4%) patients gained mean 3.8 pounds. Hb A1c was checked at the first appointment and repeated in 3 months in a total of 27 patients. In 3 months follow up there was no significant HbA1c change and it was not significantly different with change in weight.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our study demonstrates that 60% of the patients visiting food bank had 1.7 decrease in BMI, and 54.5% of the patients lost 7.7 pounds. Using a food pharmacy that incorporates a dietitian at the recommendation of physicians allows patients to engage in healthy eating while obtaining affordable foods. To further determine our results, follow up would need to be performed at 6 months and one year to evaluate hemoglobin A1C.

GETTING PATIENTS IN THE DOOR: USING MACHINE LEARNING TO INCREASE PATIENT ENGAGEMENT IN RESIDENT CONTINUITY CLINIC

Roma Bhatia; Zachary Lenhart; Patrick Lynch; Dang Tran; Janice A. Cunningham; Gary Fischer; Jaishree Hariharan. University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #3180738)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Despite having an established automated phone reminder system in place for patients, in one large academic primary care clinic, the annual no show rate (NSR) averages 27% for residents' panel patients (RP) versus 12% for faculty panel patients (FP) in the same clinic.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Continuity clinic is a crucial yet fragmented component of internal medicine training. One major contributing factor is the disproportionate number of missed appointments by RP versus FP. This not only results in poor continuity of care for patients but also decreased learning opportunities for residents. The primary objective of this study is to determine if implementation of a targeted nurse led phone based appointment reminder intervention for patients can reduce the number of missed appointments by RP.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): This urban primary care clinic involves 60 residents who see 3100 patients annually. Residents have one full clinic day weekly for 4 week periods, and see 10-12 patients per full clinic day. Compared to FP who are 71% White and 23% Black/Asian, RP are racially heterogeneous: 44% are White and 52% are Black/Asian. In addition, RP are more likely to not have insurance at all or have medical assistance compared to FP (44% vs. 17%). Usual care for both RP and FP involves an automated phone call appointment reminder that is sent 72 hours prior to their scheduled visit. For the intervention, a machine learning algorithm was utilized to identify RP who were most likely to miss their appointments. This was developed by the health system using 1.7 million office visits with the target of predicting which patient appointments will be missed. RP with at least 20% chance of missing their appointment were contacted by the nurse 48 hours prior to their scheduled appointment in addition to usual care. Voicemails were left if patients were not reached.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The number of patients called, and the outcome of these calls were recorded. The average no show rate, and percent of completed visits was calculated pre and post intervention based on the total number of appointments made and the total number of appointments attended by RP.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): During the 10 weeks of intervention, a total of 346 RP were called and 64% were reached (n= 222/346). 86% confirmed their appointments (n= 192/222) while 14% either rescheduled or canceled (n= 30/226) therefore opening slots for other patients. 54% of patients who confirmed attended their appointment (n= 104/192). Compared to pre-intervention, the NSR for RP was 22% (vs 27%) and the completed patient visits averaged 78% (vs. 74%).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This intervention decreased the RP NSR by 5%, increased the overall completed visits, and correspondingly increased the number of patients seen in clinic by residents. Compared to FP who may be

scheduled 1-2 weeks in advance, RP are in flux and may not be scheduled until 72 hours prior to the appointment time. They may also have multiple competing demands that prevent them from coming to clinic, thus requiring reminders much closer to their appointment.

HOW PRIMARY CARE RESIDENTS WORKING WITH PHARMACY TEAMS CAN HELP ADDRESS HEDIS MEASURES WHILE EDUCATING RESIDENT PROVIDERS ON THE IMPORTANCE OF MEDICATION ADHERENCE IN THE AMBULATORY SETTING

Marilyn Chacko; Yi Shan Lee; Morris Jrada; Teresa Attina; Oscar ValderramaTorres; Lisa Anzisi; Mariel Shull; Jennifer Oh; Isaac Dapkins; Neil A. Pasco. NYU Langone Health, New York, NY. (Control ID #3185116)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

As healthcare delivery shifts to the value based paradigm how do you educate primary care providers on medication adherence metrics while performing a meaningful educational experience?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1.Educate Internal Medicine residents in a Primary Care residency program on NCQA HEDIS measures regarding medication adherence metrics 2.Work with a clinically integrated network (CIN) pharmacy team on identifying patients who have not refilled their medications, and how to engage patient medication adherence

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Family Health Centers (FHC) at NYU Langone is a network of 8 Federally Qualified Health Centers in Brooklyn New York. Primary care residents, working with the NYU CIN pharmacy team, collaborated on telephonic outreach to engage patients identified by payor contracts as nonadherent on medication refills. After initial training, which included education on how the Proportion of Days Covered (PDC) rate is a quantitative metric used to measure quality of care and scripted exercise on telephonic patient engagement, residents were tasked with identifying challenges on medication refill as well as intervening when appropriate. At the end of the intervention period a resident focus group was conducted to determine the educational value in this quality initiative.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Primary endpoint was increased PDC rates based on payor data for patients who are diagnosed with either having diabetes (non gestational), hypertension or dyslipidemia. A post intervention focus group and semantical content analysis was performed regarding educational value from this exercise.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In a 6-month period 523 unique patients were engaged with 899 outreach completed. 1061 barriers were identified. The top 3 patient identified barriers were: patients unaware they had not filled the prescription (31.05%), lack of clearly identified reason for non adherence (20.23%), and patients did not feel committed to taking the prescribed medication (14.97%). When comparing PDC rates from the previous year, this intervention saw a 7% increase in aggregate PDC rates for those who were prescribed medications and having diabetes. Regarding post intervention focus groups with residents, semantic content analysis revealed the highest affinity for positive descriptors in the domains of educational value, need to expand education to resident providers, and continued interest in future quality projects with the pharmacy team.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Key take home lessons in this intervention is that telephonic pharmacy adherence outreach has a positive impact on maintaining PDC rate compliance, particularly in patients with managed Medicare plans. On educational value, further development is needed in resident curriculum regarding medication adherence and reconciliation in the ambulatory setting. Lastly residents working with pharmacy teams find value in addressing medication adherence barriers and may impact best practices in provider prescribing habits when engaging patients.

HOW TO IMPROVE FOLLOW THROUGH OF CERVICAL CANCER SCREENING RESULTS IN AN INTERNAL MEDICINE RESIDENCY CLINIC

Aparna Sarin. Mount Sinai Hospital, New York, NY. (Control ID #3186289)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Despite the barriers that remain in residency clinics of rotating residents, and the lag between performing and receiving the report of cervical cancer screening tests, how can we improve the rates of follow up on test results, and referrals to gynecology for follow up testing for abnormal results.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Ensuring that every pap smear done in our women's clinic is tracked manually 2. Having residents review every abnormal per the American Society for Colposcopy and Cervical Pathology's (ASCCP) guidelines, and to report every result to the patient via EMR, telephone, or letter

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Our internal medicine residency program is in an urban, academic center, and has a robust outpatient women's clinic - a weekly clinic that offers a longitudinal, year long curriculum in women's health to all interns. Our program created a detailed log binder, which is the responsibility of the interns, in which every PAP smear done is logged, and then tracked 1-2 weeks later by the interns on rotation. They check off on the log sheet as well as on EMR what the results were, the plan and how they reached the patient, and refer patients to gynecology is needed, including emailing the appropriate clinic for expedited appointments. This has been in effect for 2 years.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We calculated: number of PAP smears performed per calendar year, percentage of normal versus abnormal (abnormal cytology, HPV or insufficient cells requiring repeat PAP smear). We measured how we were able to reach the patient: via letter or EMR messaging (for normal results or those requiring PAP sooner than routine screening but no referral to gyn), telephone call, or certified letter if unable to reach the patient. By manual chart checking, we also will calculate the kind of abnormality, and compare that to standards in literature: percentage of normal vs ASCUS/ LGSIL vs HPV non 16/18 vs HPV 16/18 vs >LGSIL.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 206 PAP smears performed in 2018. Out of these, 153 were logged as normal (74%) and 39 as abnormal (19%). Approximately 10% PAPs are reported as abnormal and although our number may be elevated falsely due to including those that needed repeat PAP smears due to insufficient cells, it may also be a factor of a more at-risk population. We reached 77 patients (37%) by letter or electronic message, 107 were called telephonically (52%), 3 were called but didn't answer (1.4%), and 16 were sent

a certified letter due to abnormal results and patient unable to be reached (8%). 2 patients did have any documentation on how they were reached (0.01%).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): We were able to perform >200 PAPs per year, of which 19% were abnormal. We relayed results to 97% of our patients via letter (normal or certified) or telephone call. This not only provided improved health care delivery to our vulnerable patients, but also fulfilled the educational mission of our clinic by teaching residents on appropriate follow up for abnormal results.

IMPACT OF "CRITICAL CARE GENERAL INTERNAL MEDICINE (CG-GIM)" OUTSIDE THE INTENSIVE CARE UNIT (ICU) ON THE OTHER DEPARTMENTS IN JAPAN

SATOSHI MATSUNAGA. Aso Iizuka Hospital, Iizuka-shi, Japan. (Control ID #3176260)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Critical Care General Internal Medicine (CG-GIM) fills the gap between ICU and Emergency Room(ER), ICU and Internal Medicine, and ICU and the other departments. CG-GIM plays a more significant role than Step-Down hospitalists.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To clarify the role of Critical Care General Internal Medicine (CG-GIM) as a buffer To illustrate the impact of CG-GIM on ICU To describe the impact of CG-GIM on the other departments

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We have created our own team, Critical Care General Internal Medicine (CG-GIM), which consists of GIM staff and residents outside of the ICU. In addition to the role for Step-Down hospitalists, CG-GIM directly consults with ER and the other departments all the time.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Quantitative metrics

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Critical Care General Internal Medicine (CG-GIM) received 363 consultations in one year (from April 1, 2017 to March 31, 2018). CG-GIM received 166 (46%) consultations from ER, 60 consultations (16%) from non CG-GIM, 63 consultations (17%) from ICU, 42 consultations (12%) from the other Internal-Medicine departments, and 32 consultations (9%) from the other departments. On the other hand, ICU received 732 consultations in one year. ICU received 391 consultations (53%) from ER, 14 consultations (2%) from CG-GIM, 21 consultations (3%) from non CG-GIM, 51 consultations (7%) from the other Internal-Medicine departments, and 255 consultations (35%) from the other departments. CG-GIM accepted 140 consultations (39%) on the day shift, 95 consultations (26%) on the semi-night shift, 21 consultations (6%) on the late night shift, and 107 consultations (29%) on the weekend shift. In contrast, ICU accepted 218 consultations (30%) on the day shift, 284 consultations (39%) on the semi-night shift, 75 consultations (10%) on the late night shift, and 155 consultations (21%) on the weekend shift.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Critical Care General Internal Medicine (CG-GIM) plays a great role as a buffer. 1.CG-GIM reduces the work burden of ICU, non CG-GIM, other internal-medicine departments, and the other departments.

2.24/7 consultation is a special help on the weekend, the semi-night, and the late-night shift team. 3.CG-GIM enables ER physicians to consult the other departments with less conflict. In addition, CG-GIM provides senior residents with a wonderful opportunity for critical care management and procedures, such as central venous catheter insertion. The number of elderly patients with critical and complex care has dramatically increased in Japan, which requires more sophisticated decision making for CG-GIM.

IMPACT OF MEDICAL SCRIBES ON PHYSICIAN-PATIENT INTERACTIONS DURING OUTPATIENT VISITS

Robert W. Lancey. University of Missouri, Columbia, MO. (Control ID #3180884)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Do medical scribes allow physicians to spend more time interacting with patients during outpatient visits?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Do scribes increase time physicians spend facing patients, reduce time spent facing computer during outpatient visits. Do patients believe their physician spent more time interacting with them with vs without a scribe in their visit

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The widespread introduction of electronic medical records (EMRs) into medical practice has resulted in worsening satisfaction for physicians and patients. Medical scribes are one solution to physician dissatisfaction with EMRs but their ability to impact the time physicians spend interacting with patients versus with the computer in the exam room is unknown. We tested the presence of medical scribes with a prospective observational trial studying interactions between physicians and patients in the presence of computers in exam rooms running Cerner Powerchart in an academic general internal medicine (GIM) outpatient practice at the University of Missouri (MU). Project assistants observed interactions between physicians, patients, exam room computers, and scribes when present. Time data was recorded for several types of interactions in the exam room during outpatient appointments including "physician-patient", "physician-computer", "physician-scribe", and "physical examination". A survey for each patient was administered after physicians exited the rooms. The survey asked patients about their satisfaction with the visit and their perception of their physician's time spent with them versus the computer.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Time spent interacting with patients with a scribe present in an outpatient visit compared to time spent interacting with the exam room computer. Patient perception of their visit with a scribe present, including overall visit satisfaction and perception of time physician spent facing them

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): With scribes, physicians spent 57% of their time facing the patient vs. 49% with no scribe. Physicians spent less time facing EMR with scribes, 27% vs 38% without scribes, more time examining the patient with a scribe, 15% vs 10% without a scribe. The patient survey showed that patients felt their physician gave them undivided attention significantly more often with a scribe than without, 97% vs 83%, OR 14.23 (p=0.01, 95% CI: 1.52 - 133.42). Physician without a scribe spent too much time looking at the EMR when a medical scribe was not present, 28% vs 11 with a scribe, and looked at their EMR more than half the time, 22% vs 5% with a

scribe. Patients did not feel that their physicians' interactions with the EMR was a distraction during the visit, 17% without a scribe vs 16% with a scribe.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Medical scribes make a difference in the outpatient visit allowing physicians to focus more time on the patient than the EMR. Patients are more satisfied with their outpatient visits when they involve scribes, perceive their physicians spend more time focused on them when a scribe is present.

IMPLEMENTATION AND ENGAGEMENT IN A HOME VISIT PROGRAM DIRECTED TOWARDS PATIENTS AT RISK FOR PREVENTABLE HOSPITALIZATIONS IN A FEDERALLY QUALIFIED HEALTH CENTER (FQHC)

Ramiro Jervis; Neil Pasco; Isaac Dapkins. NYU Langone, New York, NY. (Control ID #3179156)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can a home visit complex care management program successfully identify and engage high risk patients in a FQHC?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Identify patients at an FQHC who are at risk for preventable hospitalization 2. Enroll and engage patients in a home visit based complex care management program.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Primary Care Plus program (PCP+) is a home visit based program established to address the needs of patients at risk for preventable hospitalizations within the Family Health Centers at NYU Langone. The program staff - a physician, a nurse practitioner, a social worker and 2 community health workers - coordinate as a team to identify and address the biopsychosocial needs of high risk patients. A key intervention is the home visit lead by a physician or nurse practitioner to perform the medical assessment, medication reconciliation, and identification of both medical and social impediments to optimal health. The program is not intended to replace the patient's primary care provider, but to function as an addition to the patient's care team, identifying and mitigating risk drivers, and handing off to the primary team and care management resources once the risk drivers have been addressed. Patients are referred into the program by either their primary care doctors or care management. The program is restricted to those patients who have a continuity relationship in the Federally Qualified Health Center, and who are identified as being at risk for a preventable hospitalization. Latitude is given to the referral source in how patients are identified; guidance is given to focus on patients with a history of preventable hospitalizations (as defined by PQI) or patients with advanced disease and potential palliative care needs.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The primary measure of success is patient engagement. Patient engagement is defined by both consent to the program and successful home visit by the medical provider. Other outcome metrics are patient characteristics, number of emergency department visits and number of inpatient hospitalizations in the 12 months before program enrollment.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Since program inception in August 2018 through December 31, 2018, 75 patients have been identified by care management or primary care providers as potential candidates for the program and

who met criteria as defined above. Of the 75 patients, 6 (8%) declined the program, and another 10 (13.3%) could not be found. The remaining 59 patients were seen at home and assessed. Total engagement was 78.7%. Patients identified represent a cohort of patients with an average of 2.0 inpatient admissions and 3.2 emergency department visits in the preceding 12 months prior to enrollment.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Identification of a high-risk patient population in a federally qualified health center and referral into a home visit based care management program is associated with high acceptance and engagement. Future study will determine if patients enrolled in the program have an impact on risk drivers and preventable hospitalizations.

IMPLEMENTATION OF A MODIFIED COLLABORATIVE CARE (CC) MODEL FOR DEPRESSION TREATMENT FOR VULNERABLE POPULATIONS

Colleen McGourty¹; Brooke Welch²; Vanessa Thompson²; Margo Pumar²; Lisa Ochoa-Frongia². ¹University of California San Francisco, San Francisco, CA; ²UCSF, San Francisco, CA. (Control ID #3146811)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Significant disparities in mental healthcare exist across the United States: racial and ethnic minorities and those living in poverty have a higher burden of depression and less access to quality mental health services than their white counterparts or those with higher socioeconomic status.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Increase patient access to mental health services for depression treatment through implementation of a modified CC model of team-based depression treatment at a Federally Qualified Health Center (FQHC). 2. Improve depression remission rates for these FQHC primary care patients, where depression prevalence is three times the national rate and only 3-5% of patients achieve remission compared to 30% in national studies.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We piloted our team-based depression treatment program at the Richard Fine People's Clinic (RFPC), an academic internal medicine FQHC that provides primary care to underserved, diverse patients in San Francisco. The team included 3 attending-level primary care physicians, a psychiatrist, a psychologist, nurses, a medical assistant (MA), and a medical student. 14 patients with depression were enrolled based on diagnosis of major depressive disorder and a Patient Health Questionnaire-9 (PHQ-9) score of >10. They were offered medication and a referral to an imbedded team of behavioral health clinicians. An MA contacted the patient within a week to verify treatment initiation. Within 2-3 weeks, the patient met with a nurse to confirm medication adherence and to assess medication side effects and titration needs. After 6-8 weeks and again at 3 months, patients were scheduled for clinic visits with a PCP to track symptoms and to determine additional interventions. Progress was tracked in a database and discussed at biweekly team meetings.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Fidelity of intervention implementation (percent of patients receiving MA phone calls, nurse visits, and PCP follow-up visits) Patient access to mental health services (rates of medication prescription and patients accessing therapy) Depression remission rates (PHQ-9 scores and qualitative symptom descriptions)

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Implementation of our CC model was successful in that all patients received a MA phone call to trouble-shoot treatment initiation, and two-thirds of patients attended a visit with a nurse to assess side effects and titration needs. Patients saw an increase in access to mental health treatments: 93% were prescribed an antidepressant, compared to clinic-wide rates of 27%, and 36% of pilot patients attended at least one therapy session, compared to only 11% clinic-wide. This intervention led to improved patient outcomes during this 6-month pilot period. The average PHQ-9 score of patients was 14 upon enrollment, and 9 at the end of the pilot period. 36% of patients reached full depression remission, compared to clinic-wide remission rates of 3-5%.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Team-based management of depression in primary care can be effective for medically underserved patient populations, even when resources do not exist to fund a full CC model.

IMPLEMENTATION OF AN ADAPTED VA MOVE! CURRICULUM COMBINED WITH A MOBILE TEXTING PLATFORM IN GROUP MEDICAL VISITS FOR WEIGHT LOSS AT AN URBAN FEDERALLY QUALIFIED HEALTH CENTER

Elizabeth "Betty" Kolod¹; Viraj V. Patel^{2, 1}; Sabrina Esbitt¹; Shyanne R. Washington³; Shwetha Iyer^{1, 1}. ¹Montefiore Medical Center, Bronx, NY; ²Montefiore Medical Center/Albert Einstein College of Medicine, Bronx, NY; ³Lehman College, Bronx, NY. (Control ID #3186082)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Group medical visits supplemented by a mobile text group may be a promising model for primary care-based weight loss intervention, however, feasibility and acceptability are unknown.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Determine the feasibility of an adapted VA MOVE! curriculum in an urban Federally Qualified Health Center (FQHC). 2) Identify characteristics of individuals recruited for group medical visits for weight loss. 3) Use a mobile texting platform to promote patient retention in group medical visits.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): From 9/2018-1/2019, we implemented group medical visits for weight loss at an urban FQHC, with an adapted Managing Obesity for Veterans Everywhere (MOVE!) curriculum. Each of 16 modified session incorporated 1-3 original sessions, and cooking and exercise demonstrations. Additionally, participants joined an encrypted mobile text group. Each session was facilitated by an attending and a resident physician, a psychologist, and a nutrition student. The attending physician met individually with participants during weekly weigh-in for documentation and to bill an individual visit.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We assessed rate of recruitment, attendance pattern, and texting platform usage. Additionally, we calculated percent weight change. Finally, we assessed known behavioral mediators of weight loss, pre- and post-intervention.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Over 1 month, patients self-referred (n=6) or were referred by their provider (n=42). On contact by study

coordinator, 22 patients were interested, 6 were not interested or available, and 20 could not be reached. The first 12 interested patients were invited to the group. Ten of the 12 invited participants (83%) presented. The 10 initial participants had mean age 51.7 years (range 31-66), and mean BMI 45.1 (range 31-57). Seven identified as Black women and 3 as Latina, despite slight clinic predominance of patients identifying as Hispanic over those identifying as Black (40% versus 37%, respectively). Five participants completed >50% of the 16 visits. One person attended 31% of visits, 1 attended monthly for the first 3 months, and 2 participants attended only the first visit due to schedule conflicts. One person was not invited back due to inappropriateness for group visits. Of the five participants completing 50% of visits, 1 lost 5% of her total body weight (TBW), 1 lost 1.7% TBW, 1 halted a pattern of weight gain, 1 maintained her weight, and the final retained participant lost 1% TBW but then gained 3.7%. On the text group, the coordinator sent visit reminders and participants communicated attendance plans. Few recipes and exercise routines were shared; participants requested greater emphasis on this function. Participants with intermittent attendance remained active in the group.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1) While implementation of group visits for weight loss is feasible, retention remains a challenge. 2) Over-recruitment of participants in group medical visits for weight loss may counteract unforeseen schedule conflicts. 3) The group texting feature was acceptable, though under-utilized in program design.

IMPLEMENTATION OF NALAXONE TRAINING AND DISTRIBUTION FOR HBPC VETERANS ON CHRONIC OPIOID THERAPY IN URBAN AND RURAL SETTINGS

Naomi Karlen. Southeast Louisiana Veterans Health Care System, New Orleans, LA. (Control ID #3162865)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): There is a high need for increasing the safety of opioid prescribing in the vulnerable home based population of Veterans in both rural and urban areas.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Improve the safety of opioid prescribing to vulnerable urban and rural home based primary care Veteran patients by increasing the amount of completed naloxone training and prescriptions. 2) Educate staff in home based primary care Veteran program on topics including opioid overdose, general naloxone information, and naloxone teaching to patients and their friends/family members. 3) Create a sustainable training system for both future new home based primary care staff and patients in order to continue education on opioid overdose and naloxone.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Southeast Louisiana Veterans Health Care System home base primary care program (HBPC) serves approximately 300 home bound Veterans in a 65 mile radius from New Orleans, Slidell, Baton Rouge (rural), and Hammond (rural) clinics. Prior to this quality improvement project, there was no process for the education and prescription of naloxone for HBPC patients at our facility. The project occurred as thus: - Facility's Pain Evaluation Program (PEP) pharmacist gave a presentation to HBPC nurses, providers, and pharmacists regarding naloxone training. - A teaching script (along with use of VA created educational videos) and electronic medical record note template were developed for the nurses regarding patient/friend/

family education on opioid overdose and use/implementation of nalaxone. - HBPC patients actively prescribed opiates were educated one the above by their assigned nurses. Once the education was complete, an intranasal nalaxone kit was mailed to the patient's home (at the time of the project, there was no active patient need for another delivery system).

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 15 trainings were completed out of 22 eligible patients. Five trainings were unable to be completed due to external factors: opiates weaned off/naloxone no longer indicated (1), patient discharged from program for various reasons prior to training able to be completed (4). Two trainings were not completed by staff despite requests/reminders. This intervention was successful in increasing the amount of naloxone training and opioid overdose education. This, in turn, increases the safety of our urban and rural home-bound Veterans who are treated with chronic opioid therapy.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Nalaxone has not been used and/or needed in our home based primary care patient population as of yet. Patients and their family/friends are interested in hearing about opioid overdose and what they can do. Many have already heard overdose and nalaxone in the news given the current opioid epidemic.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Home bound Veterans do not always have the ability to come to a facility in order to obtain training and education. It is important to develop sustainable programs to "meet patients where they are" in order to best serve their needs.

IMPLEMENTATION OF NURSE DRIVEN CLINICAL DECISION SUPPORT TO IMPROVE PRIMARY CARE MANAGEMENT OF SORE THROAT

David Feldstein¹; Linda S. Park²; Paul Smith³; Joseph Palmisano⁷; Rachel Hess⁴; Simon Jones⁵; Sara K. Chokshi⁶; Thomas McGinn⁸; Devin M. Mann⁶. ¹University of Wisconsin School of Medicine and Public Health, Madison, WI; ²University of Wisconsin Madison, Madison, WI; ³University of Wisconsin-Madison, Oregon, WI; ⁴University of Utah, Salt Lake City, UT; ⁵NYU, NY, NY; ⁶NYU School of Medicine, New York, NY; ⁷Boston University, Boston, MA; ⁸Donald and Barbara Zucker School of Medicine at Hofstra/Northwell, Manhasset, NY. (Control ID #3179759)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Underutilization of clinical prediction rules and poor uptake of provider-oriented clinical decision support (CDS) has contributed to overuse of antibiotics for sore throat.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Adapt CDS for registered nurses (RNs) to evaluate and treat patients with sore throat 2. Demonstrate the feasibility of RN visits using CDS to evaluate and treat patients with sore throat

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

We performed a 12-week pilot study to evaluate the feasibility of RN visits using an integrated clinical prediction rule (iCPR) tool to determine patient risk for strep throat and provide appropriate treatment at a family medicine clinic in a Midwest academic healthcare system. iCPR, originally developed for use by primary care physicians (PCPs), includes a risk calculator using

Centor strep throat criteria and ordersets based on patient's risk for strep throat: education for low-risk, testing for intermediate-risk, and testing or antibiotics for high-risk. To adapt the process for RN visits, we developed triage protocols so appropriate patients received nurse visits, very low risk received education and more complex patients received provider visits. No major changes were made to the risk calculator or ordersets. Four RNs, with 2-24 years of experience, received a 10-minute online training session on sore throat evaluation followed by a 45-minute in-person training on physical examination and iCPR use. RNs triaged patients by phone and conducted RN visits using iCPR and following orderset recommendations. RNs could transition to a PCP visit if they were uncomfortable evaluating the patient. **MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION):** Electronic health record data was used to determine the number of nurse visits, frequency of tool use and antibiotic and diagnostic test ordering. RNs completed a self-efficacy survey prior to training and 8-weeks after implementation. At 12 weeks, we interviewed RNs to understand barriers and facilitators to using the tool.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 162 triage calls for sore throat resulted in 77(48%) patients with RN-only visits, 45(28%) with provider visits, 38(23%) with no visit. Only 2 RN visits (<3%) converted to provider visit due to patient complexity. RNs completed the risk calculator for 99% of visits and followed recommendations in all cases except for ordering antibiotics in 1 high-risk patient with a negative rapid strep. RN confidence in their ability to evaluate and treat a patient with sore throat was 85 (SD 5.8) (0 cannot do at all; 100 highly certain I can do) prior to training and 97.5 (SD 5.0) at 8-weeks. RNs felt the tool decreased provider visits and strep testing in patients. RN's also felt that the tool increased patient and RN satisfaction.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This pilot study demonstrates that RNs can use CDS to appropriately triage, evaluate and treat acute low-complexity sore throat patients. Implementation of an RN-driven iCPR tool shows promise to reduce inappropriate antibiotic prescribing and represents a potential model for expanding RN practice using CDS.

IMPLEMENTATION STRATEGIES TO INCREASE USE OF COMMUNITY-BASED DIABETES PREVENTION PROGRAMS BY PRIMARY CARE PATIENTS AT AN URBAN SAFETY-NET HOSPITAL

Jonathan Berz¹; Lisa M. Quintiliani²; Ve Truong¹; Jennifer Murillo³; Karen E. Lasser¹. ¹Boston Medical Center, Boston, MA; ²Boston University, Boston, MA; ³Boston Medical Center, Boston, MA, MA. (Control ID #3180276)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Primary care practices refer few patients with pre-diabetes to diabetes prevention programs (DPP), and few have systems in place to identify such patients. Little is known about how to implement such systems of care among primary-care practices serving high-risk populations.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Assess the feasibility of implementing a system of identification and referral of patients with pre-diabetes to a community-based YMCA DPP. 2. Compare effectiveness of 3 implementation strategies to link patients with pre-diabetes to DPPs by comparing frequency of referral and DPP completion

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

Over an 8-month period in 2018, in an urban safety-net internal medicine primary care practice, we identified patients with pre-diabetes based on diagnosis code or most recent A1c within the previous 2 years. We abstracted data from the electronic health record. As the practice is divided into 6 separate suites, we assigned patients in each of 3 suites to one of the following groups: (1) basic patient navigation: navigator called and informed patient about diagnosis of pre-diabetes, assessed interest in a DPP referral, and placed referral if desired by patient; (2) enhanced patient navigation: basic patient navigation plus motivational interviewing to assess and address barriers to DPP attendance; (3) comparison group: Providers in the suite received a 30-minute educational session about benefits of and resources to deliver the DPP.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We measured the number of completed phone calls by navigators, call outcomes (defined as spoke with patient or other, voicemail, no answer) and duration of each call in groups 1 and 2. In addition, we assessed preliminary effectiveness of the implementation strategies by comparing frequency of referral and DPP enrollment between groups. We will interview key informants including 2 patient navigators, the DPP program coordinator and a selection of primary care providers to evaluate the acceptability of the implementation strategies and explore barriers to and facilitators of implementation.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Patient navigators called 209 patients (n=171 in basic patient navigation group and n=109 in enhanced patient navigation group). The highest frequency of referral was in the enhanced patient navigation group (n=51, 47%), followed by the basic patient navigation group (n=48, 28%) and the comparison group (n=0). Few patients enrolled in the DPP from either navigation group (n=4 in basic patient navigation group and n=2 in enhanced patient navigation group). Interview of the DPP coordinator revealed several barriers, including inconvenient class times and location, and limited class capacity.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A system of proactive outreach was successful in identifying and referring patients with pre-diabetes to a DPP. Identifying and addressing barriers to program enrollment such as scheduling, location and capacity are key for facilitating program enrollment.

IMPLEMENTING A DAILY MEDICINE ROUNDING TOOL TO PROMOTE PATIENT SAFETY AND IMPROVE COMMUNICATION BETWEEN PHYSICIAN AND NURSE DURING HOSPITALIZATION

Marwa Moussa¹; Lisa Schwartz¹; Laura Mansfield¹; Tracey-Ann Knight¹; Jennifer Renaud³; Meg Ferraiola¹; Sandra Thompson¹; Charles Okamura¹; Frank Volpicelli². ¹NYU Langone, Staten Island, NY; ²New York University, New York, NY; ³NYU Langone Hospital Brooklyn, Brooklyn, NY. (Control ID #3167999)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

As communication among patient care team members is often dangerously fragmented and effective collaboration becomes essential to provide safe hospital care for patients, we implemented the Daily Medicine Rounding Tool (DMeRT) that improved collaboration between the physician and nurse.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. We aimed to promote a patient-centered, highly reliable rounding tool to reduce hospital adverse events by streamlining real time communication between nurses and physicians. 2. We hypothesize that this tool will decrease the need for frequent calls throughout the day, ultimately improving team productivity and overall staff satisfaction.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): In our institution, the Epic's default patient dashboard columns included patient name, venous thromboemboli (VTE) prophylaxis, Medical Orders for Life Sustaining Treatment (MOLST) completion, glycemic control, and medication reconciliation completion. Expanding upon these prior default columns, we partnered with information technology and nursing to create a customized dashboard that included additional informational columns extracted from the documentation in the charts, to include the administration of intravenous fluids, oxygen supplementation, last bowel movement recorded and high risk medications (anti-coagulants, anti-epileptics, furosemide, opioids, and benzodiazepines). We then trained the physicians and nurses to discuss each patient using the customized DMeRT dashboard during interdisciplinary rounds. The average time spent on the DMeRT is 15 minutes for a total 10 patients. This helps as a reminder and the identification of potential pitfalls and safety concerns. The DMeRT was instituted on a 30 bed medical unit (5500) on June 1, 2018 with iterative improvements to content.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We will analyze data pre and post intervention to assess for impact on reducing medication errors during hospitalization, hospital acquired VTE events and improvement in glycemic control. Finally we will track MOLST completion, medication reconciliation compliance, constipation and fluid overload events added to the patient's problem list 48 hours prior to discharge.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): To date, the unit which implemented the intervention had an improvement in the Quality Hyperglycemia Scores (method used to evaluate inpatient glycemic management) from 56 in 4/2018 to 95 in 12/2018. There was an improved MOLST completion from 14% in 4/2018 to 83% in 12/2018. A Preliminary survey of 15 nurses on unit 5500 showed that 80% reported that they rarely need to call house staff within 2 hours of completing the rounding tool and 66% of nurses were satisfied with the DMeRT.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): During hospitalization, multiple aspects of patient care are overlooked while we focus on the admitting diagnosis, necessary diagnostics and treatments. Medication errors during hospitalization are commonly caused by breakdowns in communication and associated with substantial risk. This is a simple tool that utilizes information technology to efficiently and systematically review standardized aspects of care.

IMPLEMENTING A MAILED FECAL IMMUNOCHEMICAL TESTING PROGRAM FOR COLORECTAL CANCER SCREENING IN FEDERALLY QUALIFIED HEALTH CENTERS

Michael Pignone^{1, 1}; Nicole Kluz¹; Paul Rathouz¹; Eda Baykal-Caglar¹; Alison Brenner²; Brett Candelaria¹; Jessica Trevino¹; Jaison John¹; Daniel S. Reuland². ¹Dell Medical School, Austin, TX; ²University of North Carolina, Chapel Hill, NC. (Control ID #3184379)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Colorectal cancer (CRC) screening rates are sub-optimal among patients of Federally Qualified Health Centers (FQHCs), many of whom have low-income and inadequate health insurance. Mailed fecal immunochemical testing (FIT) is an evidence-based method of increasing screening, but has not been widely disseminated.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To implement a mailed FIT screening program for average-risk adults ages 50-75 who were patients in a network of FQHCs. 2. To measure uptake of mailed screening and positivity rates. 3. To ensure, through patient navigation, a high rate of completion of follow-up colonoscopy after positive FIT.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Age-eligible, average risk patients with no evidence of recent screening who were being seen in a network of FQHCs in Texas were eligible for the program. Eligible patients received a mailing with an introductory letter, return postcard to update screening status, and a single-sample FIT that could be completed and returned by mail. We used reminder text messages and letters to help ensure test completion. Patients with positive tests received support from a bilingual patient navigator to help ensure colonoscopy completion.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Numbers of patients reached 2. Uptake of mailed FIT among eligible patients 3. FIT Positivity rate 4. Proportion of positive FIT with colonoscopy completed within 90 days per medical record review

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We identified 28,306 age-eligible patients and 6,991 (24.7%) were already up to date based on medical record review. Of the 21,315 not up to date, mean age was 58 and 49.5% were female; 15.1% were African-American and 41.0% Latino. Overall, 68.7% spoke English preferentially, and 25.8% Spanish. Less than half (47.7%) had commercial or Federal insurance. In Year 1 of the program, we mailed FIT packets to 14,276 patients (67.0% of those not up to date). Of those, 18.4% (n=2,633) completed FIT and 428 (3.0%) were already up to date with outside screening based on patient report. Of those completing FIT, 142 (5.4%) were positive and 78 have completed a colonoscopy to date (54.9% completion rate) with another 22.5% scheduled to be complete within 90 days. Important findings at colonoscopy (n=78) include 34 (43.6%) with adenomas, 1 carcinoma in situ, and 2 cancers.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1. Mailed FIT is an effective, scalable means of increasing CRC screening in otherwise hard to reach, vulnerable patients in a safety net FQHC system, and should supplement in-office efforts to increase screening. 2. Achieving high rates of follow-up colonoscopy is challenging, even with high-quality patient navigation.

IMPLEMENTING A STUDENT-LED FOOT CARE CLINIC IN AN OVERNIGHT HOMELESS SHELTER

Aileen L. Doble¹; Henry C. Ashworth²; Kevin G. Sullivan³; Marya J. Cohen⁴; Gina R. Kruse⁵. ¹MGH Institute of Health Professions, Boston, MA; ²Harvard Medical School, Boston, MA; ³Boston Healthcare for the Homeless, Boston, MA; ⁴MGH, Boston, MA; ⁵Massachusetts General Hospital, Boston, MA. (Control ID #3177744)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Foot care issues can be severe and debilitating amongst those who experience homelessness; however, more could be known on the distribution of foot disease and prevalence of proper foot care in this vulnerable population.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Objective 1: To deliver basic foot care to guests at the Boston Night Center (BNC). Objective 2: To connect BNC guests with foot conditions to primary care services.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): This foot care clinic is an extension of the Crimson Care Collaborative (CCC) at Boston Health Care for the Homeless Program (CCC-BHCHP) clinic site; an interprofessional student-faculty medical clinic that serves homeless guests staying at the BNC, a drop-in overnight shelter, on Monday nights. In order to expand the impact of the clinic and better serve guests at the BNC, a needs assessment was conducted; results clearly pointed to the need for a foot care clinic. CCC volunteers partnered with faculty and leadership at the well-established St. Francis House foot clinic to develop a clinical model that involves 1) a comprehensive foot assessment 2) washing of feet in warm soapy water 3) application of preventative medications 4) referral to BHCHP for primary care services if needed.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The foot care clinic is evaluated in terms of clinical volume and patients served. The target for clinical volume is to provide foot care to a minimum of four guests each Monday evening. To understand patients served in the foot care clinic, a survey gathering basic demographic data, connection to primary care, and prevalence of foot symptoms and diagnoses is utilized. As this foot care clinic continues, other areas to explore will be guests' perceived importance of foot health and guests' health habits regarding foot hygiene.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Unofficially, the foot care clinic has received positive feedback from those receiving care and from BNC staff. So far, four CCC volunteers have cared for 21 guests at the foot clinic. The median age of the guests served is 43 years of age. The most prevalent conditions are tinea pedis (86%, n=21), and immersion foot (29%, n=20). Overall, 78% (n=18) of the guests served were already connected to primary care services, and 22% (n=18) received referral to primary care services at BHCHP.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): There is value in holding a foot care clinic at a time when other clinics are not open and when homeless persons are not seeking to secure shelter for the evening. This foot care clinic provides a space and time in which guests are able to prioritize their health, which can be difficult during the day when basic needs such as shelter and food often take precedence. Additionally, holding the foot care clinic at the BNC allows us to reach those who may not feel comfortable seeking care in a traditional health-care setting. This foot care clinic also provides a benefit to the CCC volunteers, many of whom have described the experience as transformative, demonstrating how enriching compassionate, hands-on care can be to the student learning experience.

IMPLEMENTING AMBULATORY BLOOD PRESSURE MONITORING INTO AMBULATORY ACADEMIC PRIMARY CARE: A MULTIDISCIPLINARY APPROACH

Jennifer Beach¹; Stephen P. Juraschek²; Anthony Ishak²; Kenneth J. Mukamal³. ¹Beth Israel Deaconess Medical Center, Boston, MA; ²BETH

ISRAEL DEACONESS MEDICAL CENTER, BOSTON, MA; ³BIDMC, Brookline, MA. (Control ID #3184393)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Despite expanding recommendations to use 24hr ambulatory blood pressure monitoring (ABPM) in the diagnosis and management of hypertension (HTN), access to it is limited for many academic practices.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES):

-Create a multidisciplinary outpatient HTN program within a large, urban academic primary care practice to improve HTN management. -Develop a sustainable model of ABPM embedded in primary care for the diagnosis and management of HTN. -Execute an educational curriculum to teach primary care residents to interpret results of ABPM and integrate them into a comprehensive HTN program.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

Healthcare Associates is a large, academic, urban practice in Boston, Massachusetts serving nearly 43,000 patients. We have over 60 faculty physicians, 7 nurse practitioners, 125 residents and 200 other support staff including clinical social workers, medical assistants, LPNs, RNs and phone staff. Embedded within this larger practice, we developed a collaborative multidisciplinary hypertension clinic with a focus on offering 24hr ambulatory blood pressure monitoring and providing office visits for rapid medication titration and patient education. Our clinic occurs weekly and is staffed with an attending preceptor, a doctorally-trained pharmacist, 1-2 medical residents, and LPN/RN staff. Each clinic session begins with a 30-minute teaching session led by residents, staff, or faculty followed by resident- and pharmacist-staffed office visits.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): -Number of patients and visits for HTN evaluation/treatment and ABPM -Proportion of patients with medication change -Hypertension-specific teaching modules

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): -In 2018, we saw 367 patients overall, 148 for ABPM, and 219 for medication adjustment or follow-up -In patients seen for ABPM, there is an estimated medication change rate of 54%. In those referred to confirm a new diagnosis of HTN, 30% were found to have white coat hypertension -We have developed 12 new teaching modules on a variety of HTN topics that were selected based on resident needs

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): -Challenges that we faced in developing this clinic were myriad and included material costs for monitors and software, personnel time for fitting patients with monitors and uploading the results and educational gaps for providers to learn to interpret results of ABPM testing. -Creating a multidisciplinary team allowed for each provider to work at the top of their licensure -ABPM is a powerful diagnostic and educational tool for managing hypertension, our most common reasons for referral include ruling out white coat hypertension and evaluating resistant/difficult to control hypertension -Training residents to interpret and explain ABPM to patients is a valuable and rewarding addition to their internal medicine training

IMPLEMENTING AN ELECTRONIC SYSTEM TO SCREEN AND ACTIVELY REFER TO COMMUNITY BASED AGENCIES FOR FOOD INSECURITY IN PRIMARY CARE

Amy Smith¹; Leah Zallman¹; Kathleen Betts¹; Lisa Brukilacchio¹; Fiona McCaughan¹; Erin McAleer²; Noreen Kelly²; David Elvin¹; Lisa M.

Trumble¹. ¹Cambridge Health Alliance, Cambridge, MA; ²Project Bread, Boston, MA. (Control ID #3177574)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Health related social needs such as food insecurity are prevalent in safety net healthcare settings yet these settings lack feasible systematic ways to actively refer patients to community based agencies (e.g. refer to agencies that will reach out to patients).

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Implement a systematic screening program for food insecurity in a safety net healthcare setting and integrate into the electronic health record 2. Actively and electronically refer patients who screen positive to a community based agency 2. Examine feasibility of the program

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We implemented a systematic screening program for food insecurity, integrated into the electronic health record, that enables electronic active referral to a community based agency. Patients complete paper forms which are entered into the electronic record by clinic staff. If patients agree that we can share their contact information with a community based agency, our system automatically faxes a referral to a community based agency that addresses food insecurity. We initially piloted this program on paper, then integrated into the electronic medical record and rolled it out to 16 primary care clinics of an integrated safety net health care system. We are currently piloting systems to allow patients to enter their own data via electronic tablets.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Ultimately, we aim to reduce the number of health related social needs and improve health outcomes (e.g., quality and costs). In the short, term, we use the following measures: 1. Number of individuals screened for food insecurity and referred to a community based agency 2. Proportion of patients reached by community based agency 3. Number supplemental nutrition assistance program screenings and community resource referrals (e.g., information provided on resource) by community based agency 4. Provider and staff feedback on burden and feasibility

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): To date, we have screened over 8,000 patients for food insecurity, of whom 25% screened positive for food insecurity. Our program has resulted in 1,561 referrals to a community based agency. Of these patients, 973 (62%) were successfully reached by the community based agency and offered SNAP screening. Of these, 428 (44%) accepted screening for SNAP and 56% declined because they were already enrolled or were not sure if they were enrolled. The community based agency provided information to patients on 2,001 resources for health related social needs such as food pantries, meal programs and appropriate state agencies. Feedback from providers and staff indicate the program is well received and feasible in a busy primary care setting.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A program integrated into the electronic medical record that systematically screens for food insecurity and actively refers patients to a community based agency program is feasible in a safety net setting. Such programs can actively connect patients with community based agencies that address health related social needs.

IMPLEMENTING HUNGER VITAL SIGNS: FOOD INSECURITY SCREENING IN AN URBAN UNDERSERVED RESIDENCY CLINIC

Rene McLeod^{2, 1}; Lauren V. Wood^{2, 1}; Iris S. Cheng^{1, 2}. ¹University of North Carolina School of Medicine Charlotte Campus/Atrium Health, Charlotte, NC; ²Carolinas Medical Center, Charlotte, NC. (Control ID #3163071)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Food insecurity (FI) is associated with a higher incidence of chronic disease including poorly-controlled diabetes and mental health conditions in adults yet it is often overlooked during the office visit; screening for FI in our neediest patients may help us understand root causes of poor health outcomes.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To educate residents about the relationship between food insecurity and chronic disease 2. To screen at least 10% of our clinic patients for FI using three methods 2. To refer willing patients who screen positive to a social worker and community food resource

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We initiated screening for FI as a QI project in our underserved urban resident clinic. We utilized two validated USDA questions, the "Hunger Vital Signs" (HVS) to screen patients through 3 PDSA cycles. We first sent an email to our residents to educate them about FI, the screening tools, and screening protocol. Our second PDSA cycle included a medical student who screened patients during an interview. Finally, the patients answered the HVS on a paper screener prior to a medical visit. For all PDSA cycles, residents were alerted when a patient screened positive and addressed FI during the clinic visit and added the ICD-10 code for FI to the chart. Patients who screened positive were offered referral to local food resources and a social worker.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Only 6% of resident clinic patients were screened when we informed the residents of our screening directions through e-mail. Our verbal screening effort yielded an 88% screening rate. Screening by self report on paper yielded a screening rate of 61%. Overall, 61% of all screened patients over the 3 PDSA cycles screened positive for FI yet only 54% of these patients were interested in social work assistance, help with SNAP applications or referral to a food pantry.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We found that food insecurity is a common social factor affecting health in our clinic and many patients were interested in addressing this need but not all. We found that e-mails encouraging providers to screen were not effective and having dedicated staff for in-person screening yielded the highest screening rate but may be hard to sustain. A paper screening tool may be more efficient but literacy and language barriers may pose challenges. We also noted that patients may be more forthcoming with a verbal screening tool compared to a formal paper questionnaire. Expanded efforts to screen all of our clinic patients in this underserved resident clinic are planned through validated screening tools embedded in our EHR. We will continue evaluation of this process and its effects on clinic flow, community referral and short and long term health outcomes.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Verbally screening for FI is an effective way to detect FI. However, not all FI individuals are receptive to help. Clinical flow is minimally impacted and FI can be listed in the problem list as a reminder to readdress this need at future visits. Addressing FI may help improve the management of chronic diseases such as poorly controlled diabetes.

IMPLEMENTING THRIVE, AN EHR-BASED SCREENING AND REFERRAL SYSTEM TO ADDRESS SOCIAL DETERMINANTS OF HEALTH (SDOH) IN AN URBAN SAFETY NET HOSPITAL.

Pablo Buitron de la Vega¹; Stephanie Losi²; Linda Sprague Martinez³; Allison Bovell-Ammon²; Arvin Garg²; Thea James⁴; Alana Ewen²; Marna Stack⁵; Heloisa DeCarvalho⁶; Megan Sandel²; Rebecca G. Mishuris⁵; Stella Deych²; Patrick Pelletier²; Nancy R. Kressin⁷. ¹Boston Medical Center / Boston University, Dorchester, MA; ²Boston Medical Center, Boston, MA; ³Boston University School of Social Work, Boston, AL; ⁴Boston Medical Center, Cambridge, MA; ⁵Boston University School of Medicine, Boston, MA; ⁶Boston University School of Medicine, Chelsea, MA; ⁷Dept of Veterans Affairs and Boston University, West Roxbury, MA. (Control ID #3184950)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Despite the documented impact of social factors on health, few systematic clinical strategies in primary care for addressing SDOH have been employed.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We set out to develop and evaluate a systematic clinical strategy for understanding the burden of SDOH by screening patients during primary care visits. As part of this work, we leveraged the EHR by automating patient need related to SDOH using ICD-10 codes which were matched to referral resources and provided to patients in their primary language.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Boston Medical Center (BMC) is an urban, Safety Net academic center. In transition to an accountable care model for all Medicaid patients, BMC developed THRIVE, a population-based program, adapted from the WECARE model, which aims to improve patient care by identifying and addressing social needs. We secured leadership and IT support to develop a hospital wide EHR process to: (1) screen for SDOH (housing, food, employment, utilities, affording medications, transportation, education and childcare/ older adult care support), (2) capture responses in the form of ICD-10 codes and (3) automate referral guide print outs with information to help address social needs. Following a pilot conducted among new patients in general internal medicine (GIM) clinics, we scaled up our intervention to include all patients presenting to 13 ambulatory clinics in GIM, Family Medicine, OBGYN, Infectious Disease and Pediatrics. Moreover, THRIVE is available as part of Oregon Community Health Information Network's (OCHIN) available tools to address SDOH.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We measured proportion of patients screened, proportion of signed ICD-10 code orders and proportion of signed orders for SDOH resource guides. Additionally, proportion of correct entries for a subset of paper screening results transcribed into the EHR and time expended by Medical Assistants (MA) to upload the screener in the EHR.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We found that a hospital wide program to address SDOH was both feasible and acceptable among patients and providers. Between 10/2017 and 12/2018, clinics screened 50,532 unique patients, and 20% reported at least one SDOH need. Meanwhile, 12% of patients requested support with at least one resource. Homelessness / housing insecurity (10%) and food insecurity (14%) were the most prevalent SDOH. We achieved 82% screening compliance rate across all clinics. 91% of patients with positive SDOH screenings had ICD-10 code added to visit diagnosis. Of patients requesting resources, 90% received a resource guide. Among 85 paper screening responses, 75% were reliably transcribed by MAs into the EHR.

The time study showed MAs expended an average of 1 minute to enter responses into the EHR.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): We attribute the success of THRIVE to building upon an evidence-based model, aligning efforts with hospital strategic priorities, involving key stakeholders in developing a streamlined standard workflow, leveraging EHR automation, piloting the initial program design before scaling, and incorporating staff feedback at every phase.

IMPLEMENTING TRANSITIONAL CARE MANAGEMENT SERVICE: GETTING PAID FOR COORDINATING SUCCESSFUL TRANSITIONS

Gary Fischer¹; Janice Cunningham²; Zachary Lenhart²; Cynthia Arnold³; Jaishree Hariharan³. ¹University of Pittsburgh, Pittsburgh, PA; ²University of Pittsburgh Physicians, Pittsburgh, PA; ³University of Pittsburgh Medical center, Pittsburgh, PA. (Control ID #3181550)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can the Transitional Care Management (TCM) service, with its operational and documentation requirements, be successfully implemented in a primary care practice?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To implement TCM in a large academic general internal medicine (GIM) practice. 2. To perform TCM in > 50% of targeted patients (pts). 3. To reduce readmissions in the practice population.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): In 2013, Medicare began paying for TCM to improve the care of pts transitioning from a stay in a hospital, rehab, or skilled nursing facility to home and reduce readmissions. TCM covers coordination services over 30 days, but to bill for it, a care team member must contact the pt or caregiver within 2 business days of discharge and the provider must see the pt within 7 or 14 days (depending on the level billed). By 2015 only 7% of eligible Medicare pts had TCM, even though costs and mortality were lower among TCM pts (JAMA Intern Med. 2018;178(9):1165-71). In 2018 a group involving MDs, operations, clinical IT, revenue cycle IT and compliance developed the infrastructure to provide TCM. We implemented this in an academic GIM practice in Oct 2018. An RN, working from a list of pts discharged the previous day calls targeted pts, ensures that pts' immediate needs are met, and schedules a TCM visit. An APP has dedicated slots to see pts who cannot be seen by their PCP in time. Alerts, templates, and order sets help providers recognize that a visit qualifies for TCM, meet documentation requirements, and bill appropriately.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Percent of discharges targeted for TCM. 2. Percent of targeted pts receiving TCM phone call and TCM office visit (by level of service - 99495 (moderate) or 99496 (high)). 3. Marginal increase in revenue generated from TCM. 4. 30 day readmission rate and mortality before and after TCM implementation 5. Qualitative report by TCM RN on interventions taken during calls.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): From Oct 15 to Dec 31, 373 of 737 (51%) discharged pts met our outreach criterial. Of these, 264 (71%) had an appt made, 111 (42%) within 7 days and 112 (42%) between 8-14 days. 172 (64%) of appts were completed. Some missed appts were due to readmissions. From Oct 15 to Jan 13 (2 wks after Dec 31), 154 TCM

services were billed (118 for service 99495 (ave payment/paid claim \$111) and 36 for 99496 (ave payment/paid claim \$146)). If all the TCM pts had had regular E&M visits during the time, the marginal increase in revenue is \$9,500 over the time period, likely an underestimate. After sufficient time, changes in readmission and mortality rates will be determined. TCM RN reported cases where post-discharge call resulted in interventions that likely prevented serious harm.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1. Coordination between MDs, IT, operations, and compliance facilitate the success of TCM. 2. Implementing TCM can result in timely visits after discharge and increased revenue. 3. Identifying high risk changes (e.g. diuretic doses) during TCM call may prevent readmissions. 4. Increasing pts seen within 7 days will increase revenue and will likely decrease readmissions.

IMPROVING ACCESS TO CARE FOR UNDERINSURED DIABETIC PATIENTS: LESSONS IN COLLABORATION

Stacie Schmidt¹; Mark Nissley²; Yousuf Khalifa¹. ¹Emory University, Atlanta, GA; ²Intelligent Retinal Imaging Systems (IRIS), Pensacola, FL. (Control ID #3140871)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Ensuring equitable preventive care is delivered to patients with diabetes.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Deliver screening exams with minimal impedance on physician time. 2. Close the gap toward ending preventable blindness among diabetic populations. 3. Provide best practices for engaging health systems, external organizations, and team members in providing health services.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Diabetes is the leading cause of preventable blindness in the US. Yet, national diabetic retinal screening rates are less than 40%. This is partly related to the fact that annual diabetic eye exams are ordered by the primary care physician, yet patients must schedule eye appointments at times separate from their primary care visits. Our Primary Care Center (PCC) is an academic, safety net, hospital-based clinic that provides visits mostly to uninsured low-literacy patients. Patients in the PCC often attend different appointments between various healthcare specialties. Multiple visits require patients to manipulate their schedules, and secure transportation. We suspect such inefficiencies leads to more scheduling of appointments, increased no-shows, diminished patient satisfaction, and reduced health outcomes. We established diabetic retinal photo services within our PCC that (1) identify patients eligible for annual diabetic retinal screening exams, (2) provide diabetic retinal screening exams with minimal impact to physician workload, and (3) allow images to be reviewed in a timely manner by a trained retinal specialist, with next steps for diagnosis and management clearly delineated. We collaborated with Intelligent Retinal Imaging Systems (IRIS), a company that provides critical access to ophthalmology services for patients. The exam is a critical measure of success in caring for a population; by performing this service, we increased compliance to this metric for our health system. As healthcare shifts from pay for service to pay for performance and quality, we have proven that a simple, collaborative model is capable of closing the gap toward ending preventable blindness.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Monthly reporting metrics enabled us to provide more than 11,000 patients access to diabetic eye exam services, and identify 1800 patients whose vision was saved.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Results to date include the identification of 4,000 patients with some form of pathology that would not have been known without this service, and the more than 1,800 patients whose vision was saved as a result of this program. We have maintained the percentage of non-readable photos at less than 5% across the PCC.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1) Investment and collaboration with external organizations enhances delivery of preventive services in the primary care center. 2) Ancillary team member involvement improves efficiency of services delivered with minimal impact to the PCP's time and engagement of staff. 3) Integrating services within the PCC provides equitable care to populations who struggle with navigating healthcare systems.

IMPROVING ACCURACY OF INTERNAL MEDICINE RESIDENT PATIENT PANELS IN AN ACADEMIC PRIMARY CARE SETTING

Laura Hallett¹; Gertrude Manchester¹; Richard M. Forster². ¹University of Massachusetts Medical Center, Worcester, MA; ²University of Massachusetts Medical School, Worcester, MA. (Control ID #3185613)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Internal medicine (IM) residents are assigned to be the primary care provider for certain patients in their continuity clinic, but when a patient's PCP is listed incorrectly in the electronic medical record, it can lead to communication delays, lack of continuity for patients, and lower resident satisfaction.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Using an electronic medical record (EMR) displaying pairings of resident PCPs with faculty preceptors, we sought to: 1. Reduce the percentage of resident-owned patients with no co-attending listed in the EMR 2. Expand resident patient panels to include previously inaccurate patient/PCP pairings 3. Initiate a curriculum for residents to work with faculty preceptors on active panel management

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): To address inaccuracies in resident patient panels, we met with 20 PGY-2 and PGY-3 residents who had continuity clinic at our residency program's largest primary care site, which serves a diverse, medically complex urban patient population. We created a list of patients currently assigned to each resident and a list of all patients they had seen in their clinic in the previous year. Residents went through both lists to identify patients who were incorrectly assigned and identified corrections to be made. We then addressed these corrections in the EMR and ensured the correct resident PCP and academic PCP were listed for all resident-assigned patients. We created a list of resident patients designated as incorrectly assigned to be distributed to faculty preceptors to ensure accuracy.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Our metrics to evaluate this intervention were: 1. Percentage of resident-owned patients with resident PCP and attending preceptor listed correctly in EMR 2. Change in resident panel size post-intervention

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): After our intervention, we found: 1. Percentage of resident-owned patients with incorrect resident PCP and faculty pairing listed in EMR decreased from 54% to 26% 2. Resident panels expanded by 15% overall through correct identification of resident-owned patients 3. Residents identified 21% of patients assigned to them as incorrectly assigned (i.e. patients they had never seen but were listed as their PCP)

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Conducting a panel review with residents allowed for a significant increase in panel accuracy and expansion of their patient panels. Complex decision-making is required about patients who residents identified as not theirs, and we solicited preceptor input to determine the correct ownership of those patients. We noted anecdotal increased resident satisfaction following this intervention, and hope to collect survey data to further explore resident satisfaction. Correct identification and maintenance of resident patient panels is a labor-intensive process that needs oversight from residents, attendings, nurses, and staff. Our next step is the development of a curriculum focusing on active panel management, in which residents will meet multiple times per year with their faculty preceptors to address panel accuracy and performance on quality metrics.

IMPROVING COLORECTAL CANCER SCREENING RATES WITH ELECTRONIC MEDICAL RECORD INFORMED CARE MANAGEMENT

Joseph Daprano^{1, 2}; David Mansour⁴; David Margolius³; James Misak⁴. ¹MetroHealth Medical Center, Willoughby Hills, OH; ²Case Western Reserve University, Cleveland, OH; ³MetroHealth, Cleveland, OH; ⁴MetroHealth Medical Center, Cleveland, OH. (Control ID #3185864)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Colorectal cancer is the third most common cancer diagnosed among men and women and the second leading cause of cancer death in the United States; however, nearly one-third of eligible adults in the United States have never been screened for colorectal cancer.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1.) Create an EMR based population health process to improve colorectal cancer screening in an urban and suburban outpatient practice setting. 2.) Develop care management processes that can be implemented by any staff in urban and suburban outpatient practice settings.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Patients eligible but not yet screened for CRC were identified with the use of an EMR dashboard. Patient Service Representatives (in the suburban practice) and Community Health Worker students (in the urban practice), were educated on the importance of CRC screening and trained to contact patients in need of CRC screening. Bulk orders for all eligible patients in a practice were created by physicians via EMR. Patient Service Representatives and Community Health Worker students used telephone and in person contact with eligible patients for both the initial and follow up of patients who had not yet completed CRC screening. Contact events were recorded in a paper and eventually EMR file to allow for continued follow-up to completion as needed.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1.) A more than 10 % increased percentage of eligible patients screened for colorectal cancer at each of the two sites. 2.) Uptake of the EMR based Care Management process in each of the two sites.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): During the thirteen month period from December 2017 through Dec 2018 an average of 5000 persons were eligible to be screened for colorectal cancer with approximately 4000 of those patients in the suburban practice and 1000 of those patients in the urban practice. The suburban practice achieved a 12% increase in colorectal cancer screening rising to 73% of eligible patients screened and the urban practice achieved an 11% increase in colorectal cancer screening rising to 81% of eligible patients screened. Although initially only Patient Service Representatives and Community Health Worker students were trained in the process of EMR based care management, Medical Team Assistants and Nurses also began using the process. This uptake by all staff allowed for more consistent follow-up on patients who had been started on the CRC screening pathway but were not completing CRC screening. This persistence in follow up, facilitated by the EMR dashboard, in turn greatly increased CRC screening rates.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Patients responded to repeated encouragement to complete colorectal cancer screening. A population based, EMR facilitated care management process can quickly and greatly increase colorectal cancer screening in a diversity of practice settings.

IMPROVING ENGAGEMENT IN DEPRESSION TREATMENT AT AN ACADEMIC MEDICAL CENTER THROUGH A TELEPHONE-BASED DEPRESSION NAVIGATOR PROGRAM

Juliana Macri¹; Maria E. Garcia¹; Hannah Rapp²; Maki Aoki¹. ¹University of California, San Francisco, San Francisco, CA; ²School of Public Health, University of Washington, Seattle, WA. (Control ID #3184395)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can targeted outreach by a Depression Navigator at an academic primary care office increase rates of depression response/remission by improving receipt and maintenance of evidence-based depression care?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): - Outreach to all patients recently prescribed an antidepressant to assess for concerns and adherence - Provide coaching around common reasons for early non-adherence (e.g. side effects, "not working", distrust) - Link patients to behavioral health (therapy/psychiatry) and ensure primary care depression follow-up

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): In a diverse, academic general practice, we initiated universal depression screening (using the PHQ-2 followed by the PHQ-9 if positive) in October 2017. A clinic-based Depression Navigator began calling patients with a PHQ-9 > 9 who had been newly prescribed an antidepressant. Calls aimed to engage patients in their depression treatment plan by assessing medication adherence and coaching around common reasons for early non-adherence. The Navigator also performed care coordination, linking patients to behavioral health (therapy/psychiatry) and scheduling 4-6 week follow-up with PCP/primary care team.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The primary goal of the pilot program was to increase depression response (defined as a decrease in PHQ9 score by 2+ points) and remission (defined as a >50% score decrease or score <5). To achieve this goal, process measures included: 1) Increased medication adherence at 1 month, 2) Scheduled depression follow-up visit within 4-6 weeks, and 3) Decreased

proportion of program-eligible patients who were not contacted or lost to follow up.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Over the first 4 months of this pilot program, 53 patients with newly prescribed antidepressants were enrolled. Of these, 45 (85%) patients had at least one contact with the Navigator and 29 (55%) had more than one contact. Among patients with repeat PHQ-9s (n = 26), 11 (42%) achieved response, 6 (23%) achieved remission, and 9 (35%) had no improvement in PHQ9 score. Medication adherence dropped from 84% at 1 week (n=45) to 66% at 1 month (n=38). The Depression Navigator made 19 follow-up appointments for 14 individual patients, though only 6 patients (11%) had a repeat PHQ-9 within 6 weeks of anti-depressant initiation. The program's impact was limited primarily by high rates of eligible patients never reached or lost to follow up (30%, n=16) and secondarily by patients declining medications and/or participation (13%, n=7).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Proactive outreach to patients recently initiated on an anti-depressant in their primary care office may better engage a large portion of this vulnerable population in their depression treatment plan. Further implementation success depends on increasing in-office follow up rates, and reducing the proportion of patients never reached and lost to follow up. Systems-level interventions with innovative approaches to patient outreach and improved scheduling access may help resolve these barriers.

IMPROVING LATENT TUBERCULOSIS SCREENING IN A COMBINED INTERNAL MEDICINE AND PEDIATRICS RESIDENCY OUTPATIENT CLINIC AT DENVER HEALTH - A RESIDENT DESIGNED AND IMPLEMENTED QUALITY IMPROVEMENT PROJECT

Timothy P. Newton²; Jonathan S. Schultz¹; Amy Beeson¹; Joshua M. Gannon¹; Anne Frank¹; Julie Venci¹. ¹University of Colorado, Aurora, CO; ²University of Colorado School of Medicine, Englewood, CO. (Control ID #3185338)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): There is a large proportion of new and established Denver Health (DH) primary care adult and pediatric patients who meet the criteria for screening of latent tuberculosis infection (LBTI) and have never been screened and may be at high risk for development of active TB and possible transmission.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We proposed a quality improvement intervention to improve screening at the DH Internal Medicine and Pediatrics (Med-Peds) resident clinic. The objectives were to: 1. Identify patients who are foreign born and at risk of TB. 2. Discuss screening with those identified, and if positive, treatment options. 3. Perform QFT testing on consenting patients who are at risk.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): In 2016, 64 new cases of active tuberculosis (TB) were reported in Colorado, for a case incidence rate of 1.6 per 100,000 in Denver. Over half of these cases could have been prevented with appropriate screening and treatment. More than 70% of patients were born outside of the US; 24% were from Mexico and the rest from 22 other countries. The Med-Peds residency clinic at DH is located within the Federico F. Peña Southwest Family Health Center in Southwest Denver, a primarily Hispanic and low-income community. Med-Peds residents identified that high risk patients, including those who were

foreign born, were rarely screened for LTBI. An intervention was designed that included an education session, an email reminder to residents and flowchart with LTBI screening criteria posted in the DH resident clinic.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The proportion of those who were appropriately screened out of all who met the inclusion criteria at clinic visits were compared 12 months before and after the intervention period with a chi-squared test. Also a run chart was created to show changes overtime. All analyses were conducted in SAS 9.4.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A total of 405 patients met the inclusion criteria from May 1st 2016 to April 30th 2017, prior to the intervention. The mean age was 30 years (SD 24) and primarily female (55%). Only 16 (4%) of the 405 patients were appropriately screened with a QFT test. After the intervention, from June 1st 2017 to May 31st 2018, a total of 619 patients met the inclusion criteria, with a mean age of 33 years (SD 25) and primarily female (56%). An increase to 67 (11%) of the 619 patients were appropriately screened ($p < 0.001$). After the intervention, Med-Peds residents were nearly 3 times as likely to screen patients appropriately for LTBI (RR 2.74, 95% CI (1.61-4.66)). Among those, 9 of the 83 (11%) had a positive QFT, had a chest X-ray performed and were referred for LTBI treatment.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): - Resident led QI initiatives can be effective in primary care clinics - Primary care clinics can effectively initiate LTBI screening programs

IMPROVING MENTAL HEALTH CARE APPOINTMENT SHOW-RATES AT AN URBAN PRIMARY CARE TRAINING SITE

Olufunke Adeusi²; Tamara Goldberg¹. ¹Mount Sinai, New York, NY; ²Mount Sinai St. Luke's and Mount Sinai West, New York, NY. (Control ID #3180926)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Does the method of communication between care providers and on-site behavioral health integration professionals (BHI) at time of referral impact mental health appointment show-rates among an underserved patient population?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To improve patient show-rates for initial mental health appointments. To assess residents' familiarity with the collaborative care model and on-site BHI services.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): This project was implemented at a Federally Qualified Health Center in New York City that serves as the primary care practice site for our internal medicine residents. We reviewed data over a three-month period regarding method of BHI referral (EMR order versus warm-handoff) and mental health appointment show-rates. Resident providers were surveyed regarding knowledge of the collaborative care model and satisfaction with their degree of engagement with BHI professionals. Next, we implemented a collaborative intervention to improve resident engagement with BHI services including: presence of a BHI team member at pre-clinic huddles and dissemination of a resource sheet describing the collaborative care model and how to conduct a real-time, warm hand-off with BHI staff. Finally, post-intervention referral data and show-rate

data were obtained, and will continue to be collected through the Spring of 2019.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Metrics include BHI referral data and mental health show-rate data, pre and post intervention.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Baseline show-rates to a first mental health appointment were 23.8% (25/105) overall. Show rates were 20.7% (19/92) with EMR referral only, and 46.2% (6/13) for EMR referral with a warm handoff. Post-intervention patient show-rates were 15.1% (14/86) for EMR referrals only, and 50% (9/18) for EMR referrals with a warm handoff. 19 of 40 residents completed the baseline survey. Only 42% felt somewhat confident about their knowledge of the collaborative care model and 61% felt satisfied with their degree of engagement with BHI.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Despite on-site BHI services and overall provider satisfaction with BHI engagement, the vast majority of BHI referrals at our urban underserved clinic lacked a warm-handoff between providers, with overall show-rates less than 25% for initial mental health appointments. However, show-rates more than doubled when a warm-handoff between the primary care provider and BHI professional was performed rather than EMR alone. This suggests that open collaboration can lead to improved show-rates and patient engagement. Visibility of BHI staff at morning huddles and educational pamphlets for residents may help improve resident knowledge gaps and increase the motivation for warm-handoffs.

IMPROVING MONOFILAMENT TESTING IN UNCONTROLLED DIABETIC PATIENTS IN AN OUTPATIENT COMMUNITY CLINIC - A RESIDENT LED INITIATIVE

Priya Jaisinghani; Payal Parikh. Robert Wood Johnson, Edison, NJ. (Control ID #3179963)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): How to improve annual monofilament exams in diabetic patients in an underserved community health clinic

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To improve the rates of annual monofilament exam as well as resident documentation from the baseline of 44% to 70% for the cohort of diabetic patients at Eric B. Chandler Health Clinic (EBCHC)

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We identified barriers to performing annual monofilament exams by creating an in-depth root cause analysis. We charted our possible interventions on the pay-off priority matrix and enacted them in a multitude of PDSA cycles. Our goal was to ensure that a greater percentage of patients at EBCHC with uncontrolled diabetes were receiving monofilament exams during their patient encounters. Our interventions included a multidisciplinary approach involving environmental factors such as supplies, systemic factors such as the electronic medical record (EMR), provider factors such as education, communication factors, and patient factors such as increasing awareness on preventative medicine. First, it was ensured that all patient exam rooms had a full supply of monofilaments. Then, providers were educated regarding the location of the monofilaments in an exam room and the importance of regular monofilament exams in patients with diabetes. All resident

physicians were further educated on the proper location to document diabetic foot exams in the EMR. We also included the MA and RNs in our process improvement by encouraging them to ask every patient who was getting an A1c checked to remove their shoes and socks in preparation for the annual visit. Informational posters were created and placed in exams rooms in English and Spanish requesting patients to remove their shoes and socks if they have diabetes so that their resident physician could perform the monofilament exam.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Pre-intervention data was obtained from the EMR which showed that out of 1046 diabetic patients, 44% of patients had monofilament testing within the past 1 year.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): For the cohort of diabetic patients seen at EBCHC between October 1, 2017 to December 31, 2017, 66% of patients had a visit with documentation and completion of annual monofilament exam compared to 44% prior to interventions.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Patients with diabetes are 15 to 25 times more likely to lose part of a leg than people without the condition (International Diabetes Federation (IDF)). Throughout the world, up to 70% of leg amputations are performed in people with diabetes (IDF). Data from 2001 shows diabetic foot care costed \$10.9 billion and is continuously increasing (Raghav). One study on diabetic foot examinations in the clinic setting found that 844 (41.4%) patients with diabetes reports that their healthcare provider checked their feet for sores during the past year (Al Sayah). With the high risk of amputation in diabetics and increasing healthcare costs, there is room for improvement in implementing easy screening techniques such as the monofilament exam in outpatient clinics which have high impact on patient outcome and healthcare cost.

IMPROVING NALOXONE COPRESCRIBING FOR PATIENTS ON HIGH DOSE OPIOIDS AT HOSPITAL DISCHARGE

Rebecca Richardson; Polina Kukhareva; Kensaku Kawamoto; Christopher Walls; Phillip B. Warner; Jacob McKenna; Kencee K. Graves. University of Utah, Salt Lake City, UT. (Control ID #3145408)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Taking high doses of opioids places patients at high risk of accidental opioid overdose, and the Centers of Disease Control and Prevention (CDC) has recommended co-prescription of an opioid reversal agent to these patients; however, there was no standardized process to ensure this was done at hospital discharge.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The objectives of this study were to first understand the current state of opioid and naloxone co-prescribing on hospital discharge based on CDC guidelines; and second, to increase the number of naloxone prescriptions at the time of discharge from the University of Utah Hospital by 20% for patients on morphine milligram equivalents (MME) of 100 or greater within the 6 months following the implementation of an electronic alert through the hospital electronic medical record (EMR).

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Our study was set at a single academic medical center and is focused on a single group of general internal medicine hospitalist physicians and

advanced practice clinicians (APCs) caring for adult patients in an inpatient setting. Prior to the intervention, discharge data from the University of Utah Internal Medicine Hospitalist group in August 2017 was analyzed to assess opioid and naloxone co-prescriptions at the time of discharge. Data query indicated that there were 71 patients who were discharged on an opioid (oxycodone, hydrocodone (including combination with acetaminophen) and hydromorphone). A chart review of a small subset of 23 patients showed that 8 (35%) were discharged on greater than 100 MME and 14 out of 23 were discharged on greater than 50 MME. Zero patients were discharged with a co-prescription of naloxone. Therefore, an intervention was created to identify patients on high doses of opiates that would put them at risk for accidental overdose. A best practice alert (BPA) was built into our Epic EMR via the discharge order set to calculate the MME a patient is prescribed at discharge, then alert the provider if a patient is prescribed more than 100 MME, and lastly, prompt the clinician to co-prescribe naloxone prior to hospital discharge. The BPA was introduced to a pilot group of physicians and APCs in September 2018.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Using discharge data collected from the EMR, we compared the number of patients discharged on opiates greater than 100 MME and the percentage of those patients discharged with naloxone before and after the BPA was implemented.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Data collected from September to November 2018 showed that the BPA fired for 8 patients. Naloxone was co-prescribed for 5 out of the 8 patients (about 62%).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our intervention of implementing an electronic alert prompting providers to co-prescribe naloxone significantly increased the percentage of naloxone prescriptions for patients on high dose narcotics. As we have shown improvement with our pilot, we have now launched the BPA for all internal medicine units at our hospital. This is an adaptable strategy for other institutions using Epic as their electronic medical record.

IMPROVING PATIENT ENROLLMENT IN A PATIENT-WEB PORTAL THROUGH A MULTI-TIERED INTERVENTION

Eugene J. Lucas²; Carlos A. Lopez¹; Srinel Nizambad³; Ankita Sagar².

¹Memorial Sloan Kettering Cancer Center, New York City, NY; ²Zucker School of Medicine at Hofstra/Northwell, Brooklyn, NY; ³State University of New York at Stony Brook, Stony Brook, NY. (Control ID #3186320)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): In a National Committee for Quality Assurance Patient-Centered Medical Home Level III site that caters to an at-risk patient population, the proportion of patients signed up for access to their health care data via an online patient portal was found to be below the desired goal and highlighted the need for an improvement-oriented strategy.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The objective was to increase the proportion of enrolled patients from a baseline of 18.5% of the clinic population to 25%. We employed a 3-phase intervention over the course of 9 months and also sought to compare the various success rates of each of the 3 methods.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

Baseline enrollment data for the cohort of patients being followed by participating residents was obtained via electronic health record query for the period of January 2017 to September 2017; subsequent enrollment data was obtained at the conclusion of each of the three intervention phases. During phase-1 (from October 2017 to December 2017), participating residents incorporated a discussion of the portal with patients and provided an instructional handout during clinic visits. During phase-2 (from January 2018 to March 2018), a volunteer was introduced into routine clinic visits to provide portal education and assistance with portal enrollment to patients. During phase-3, e-mail invitations with instructions on how to enroll in the portal were automatically sent to patients at the time of their registration for their visits.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The primary metric to evaluate success was the overall percentage of patients signed up for access to the online patient portal. A secondary metric was the sign-up success rate for each of the 3 separate approaches.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): From January 2017 to September 2017—the period before our intervention—a total of 535 patients were seen by the participating internal medicine clinic residents, of which 99 (18.5%) were already enrolled in the portal. After phase-1 of the intervention, 58 of 303 (19.1%) patients seen by participating residents were enrolled in the patient portal. At the conclusion of phase-2, 54 of 228 (23.7%) patients seen by participating residents were enrolled in the patient portal. Furthermore, 47 patients of 228 patients completed their visit with the volunteer, and of these 47 patients, 21 patients enrolled into the portal, giving a yield of 44.6% from the volunteer intervention alone. At the end of phase-3, 22 of 100 (22%) patients seen by participating residents were enrolled in the patient portal.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): While our study demonstrated modest overall success rates for combining the various methods of improving patient portal sign up rates, a more important outcome was the much greater success rate of the volunteer-based method. In the setting of an at-risk patient population, efforts to dramatically increase patient portal enrollment may need to consider having a staff member or members devoted to assisting with the sign-up process and usage of online patient portals.

IMPROVING PPI PRESCRIBING PRACTICES IN AN ACADEMIC SAFETY-NET PRIMARY CARE CLINIC: QUALITY IMPROVEMENT PROJECT

Naren S. Nallapeta¹; Smita Y. Bakhai². ¹University at Buffalo, Buffalo, NY;

²SUNY at Buffalo, Williamsville, NY. (Control ID #3173031)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Proton Pump Inhibitors (PPI) overuse in both inpatient and outpatient settings have increased drastically over the last 2 decades. Overuse of PPIs continues despite evidence based guidelines and prolonged PPI use carries serious adverse effects.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The aim of this quality improvement (QI) is to reduce the percentage of patients inappropriately prescribed PPIs between the ages of 40-75 years from a baseline rate of 80% to less than 60% within 1 year in hospital based internal medicine clinic (IMC).

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

We used the Plan-Do-Study-Act (PDSA) model and performed a root cause analysis to identify barriers. The major barriers included system, lack of electronic medical record (EMR) alerts, gaps in knowledge in physician and the patient, and fear of discontinuation of the PPI. Multidisciplinary QI team included nursing and ancillary staff, residents, attending physicians and social worker from IMC, staff from Gastroenterology (GI) Information technology (IT) department and patients. Outcome measure included reducing rates of patients inappropriately prescribed PPIs. Process measures included the percentage of patients on PPI who have their Gastroesophageal reflux disease assessed during the clinic including assessment for alarm symptoms and the percentage of patients who are appropriately referred to GI clinic for an esophagogastroduodenoscopy (EGD). Balancing measures included increase in patient wait times in the clinic and increase in poor access to EGD. QI team performed four PDSA cycles from January 2018 to October 2018. The first PDSA cycle consisted of creation of EMR templates with goals of redesigning of nursing work flow to alert physicians to review chronic PPI use and reminding physicians to evaluate alarm symptoms; and to improve medical documentation for continuation of chronic PPI use. Other PDSA cycles included education to the physicians, nursing staff and patients. Physician education consisted of PowerPoint Presentation with small group discussion about evidence based guidelines for treatment of GERD. Nursing staff and physicians were also trained on a new EHR template and workflow for prescription of PPI. Electronic patient registry was created in collaboration with IT department

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Data analysis was performed by monthly run chart. The percentage of patients' inappropriately on PPI's were reduced from 80% in January 2018 to 67.7% by October 2018.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We achieved 51.1% for patients on long term PPI use that completed EGD from the baseline of <40%. During project period, we referred 83.87% of patients on chronic PPI use to GI clinic from 72.9% in Jan 2018.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Lack of automated medical decision support tool was identified as the biggest barrier. Optimization of EHR and education to QI team members were crucial for the success of this QI.

IMPROVING REFERRALS FOR PENICILLIN ALLERGY TESTING: A PRIMARY CARE STRATEGY FOR PENICILLIN ALLERGY DELABELING

Dustin Fowler; Samuel O. Schumann. Medical University of South Carolina, Charleston, SC. (Control ID #3186231)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Despite approximately 90% of patients who report a penicillin allergy having penicillin tolerance, less than 0.1% of penicillin allergy reporters undergo appropriate confirmatory testing, lending to increases in unnecessary broad-spectrum antibiotics use, the rates of certain drug-resistant infections and medication costs.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Identify patients who report a penicillin allergy and are candidates for penicillin allergy testing, through a

standardized screening protocol 2. Refer identified patients for penicillin allergy testing, through a streamlined workflow

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

Within our academic internal medicine residents' clinic, we screened all patients presenting for an appointment over the course of one month for a history of penicillin drug reactions and interest in penicillin allergy testing. Excluding patients who reported tolerating multiple, subsequent episodes of penicillin exposure, we offered referral for penicillin allergy testing to interested patients. Additionally, written educational material was provided to patients. Prior to project initiation, we partnered with colleagues in the division of allergy / immunology to ensure appropriate referral workflow and availability of testing. Internal medicine residents also received academic detailing on the impact of penicillin allergy testing and the quality improvement project.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Measures of success include the response rate of screened patients and the proportion of candidates for penicillin allergy testing who received a referral for testing.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 412 out of 800 outpatients completed screening over one month, providing a response rate of 52%. According to chart documentation the prevalence of penicillin allergy among our outpatients is 4%, however 17% (71) screened patients reported a history of penicillin reaction. 10% (7) of patients who reported a history of penicillin reaction also reported continued penicillin use without consequence. 35% (22) of patients reporting history of penicillin reaction were interested in penicillin skin testing. 36% (8) of interested patients were referred for testing.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Implementation of a standardized screening protocol, can quickly identify appropriate candidates who for penicillin allergy testing, in line with American Academy of Allergy, Asthma, and Immunology and Infectious Diseases Society of America recommendations. However, less than half of patients reporting interest in penicillin allergy testing received a referral for testing. Further data is needed to determine the drivers of penicillin allergy testing referral. Additionally, it is unclear why a larger percentage of patients reported a history of penicillin reaction compared to chart documentation of allergy.

IMPROVING SAFE PRESCRIBING OF OPIOIDS FOR HOSPITALIZED OLDER ADULTS WITHIN AN ELECTRONIC HEALTH RECORD (EHR) BASED PRESCRIBING CONTEXT

Kathleen Drago; Jackie Sharpe; Bryanna De Lima; Abdulaziz S. Alhomod; Elizabeth Eckstrom. Oregon Health & Science University, Portland, OR. (Control ID #3183324)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Hospitalized older adults are at risk of being prescribed medications at inappropriate doses and medication-related adverse events are a common hazard in acute care, driven in part by provider reliance on age-independent dose defaults within EHR medication orders.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We developed an EHR-based, age-triggered set of alternate dose defaults to enhance thoughtful, age-appropriate prescribing without significant alterations to normal prescriber workflows.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

The Geriatric Prescribing Context (GPC) is an Epic-based set of alternate dose defaults triggered for patients 75 and over. It offers pre-set age-sensitive dose and regimen defaults for 74 medications compiled by a geriatrician and pharmacist team using evidence-based tools. GPC went live in Epic at our Level 1 tertiary care academic medical center in July 2017 and is active only for inpatients, not Emergency or outpatients. Development & implementation by the core team took approximately 50 hours. There was no formal training of prescribers.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): This analysis compared average dose, total daily dose and doses per day for oxycodone, oral & IV hydromorphone for 6 months before and after GPC went live in July 2017. The data were retrieved from the EHR database retrospectively; including patients 75 and older with an inpatient encounter within the study time frame and who received at least one dose of any of the three medications of interest as a standing order, not from an order set. Unpaired T-tests assuming the unequal variance were performed via STATA 15 to determine statistical significance.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Data from pre and post-GPC implementation revealed the following changes: Oxycodone Pre (n = 1646) Post (n = 1874) Average Dose 6.34 mg 5.92 mg p = 0.008 Doses per Day 2.71 2.89 p = 0.003 Total Daily Dose 19.72 mg 19.19 mg p = 0.51 Oral Hydromorphone Pre (n = 162) Post (n = 260) Average Dose 2.88 mg 1.8 mg p < 0.05 Doses per Day 2.99 3.07 p = 0.65 Total Daily Dose 9.92 mg 5.84 mg p = 0.0001 IV Hydromorphone Pre (n = 714) Post (n = 644) Average Dose 0.42 mg 0.38 mg p = 0.02 Doses per Day 2.74 2.55 p = 0.1 Total Daily Dose 1.24 mg 1.13 mg p = 0.17

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): These results suggest that an EHR-based set of alternate dose defaults for a high risk population of older adults may be effective at aligning prescribing practice with population-specific recommendations with relatively little time or cost investments. This simple and potentially effective intervention in resource-limited environments may minimize risk to hospitalized older adults.

IMPROVING TREATMENT OF PREDIABETES WITH METFORMIN IN AN INTERNAL MEDICINE OUTPATIENT CLINIC

Kelly Koehn¹; Natalie Cohen²; Ankit R. Parikh¹; Gudbjorg Jonsdottir¹; Melissa B. Ludgate⁴; Heidi Ahmed³; Nanmeng Yu¹; Robert Szalewski¹; Hashim Chaudhry⁴; Rebecca S. Davis¹; Krista M. Johnson⁴. ¹University of Iowa Hospitals and Clinics, North Liberty, IA; ²University of Iowa Hospital and Clinics, North Liberty, IA; ³The University of Iowa Hospitals and Clinics, Iowa City, IA; ⁴University of Iowa, Iowa City, IA. (Control ID #3184097)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The American Diabetes Association (ADA) recommends metformin in addition to lifestyle modifications in patients with prediabetes <60 years old to prevent progression to type II diabetes; however, a recent study found only 3.7% of eligible patients with prediabetes were prescribed metformin.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Our aim was to increase metformin use in eligible patients < 60 years old with prediabetes to 15% from November 2017 to April 2018.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): This quality improvement project was implemented at an outpatient IM clinic associated with University of Iowa Hospitals and Clinics. Participants included both IM residents (N=37) and IM faculty (N = 19) who had their primary care clinics at this site. Our interventions consisted of teaching sessions to other IM residents including a brief didactic on the impact of prediabetes and current ADA guidelines. Residents viewed a video clip explaining how metformin works, as well as how to prescribe and titrate the medication. We also placed bright pink placards with information regarding the diagnosis and treatment of prediabetes on computers in the outpatient clinic workstations as a visual reminder to consider prescribing metformin for prediabetes if appropriate.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We searched our electronic health record database for all patients aged 18-60 seen in our clinic from October 1, 2016 to October 1, 2017 that met criteria for prediabetes as defined by A1c level between 5.7-6.4, and who did not have a diagnosis of type 1 or type 2 diabetes mellitus in their problem list (N=410). The same method was used for selection of patients post-intervention from November 1, 2017 to February 1, 2018 (N=229). A two proportional Z test was used to compare the proportion of patients with prediabetes who had metformin listed on their medication list before and after the intervention.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): There were no significant differences between the pre- and post-intervention groups in gender, median age, BMI and mean hemoglobin A1c. The total percentage of patients with prediabetes prescribed metformin increased from 8.3% pre-intervention to 13.5% post-intervention ($p=0.048$). In a separate analysis for patients with a BMI greater than 35, metformin prescriptions increased from 11.4% pre-intervention to 16.5% post-intervention, although this result did not reach statistical significance ($p=0.330$)

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Although we did not reach our aim of 15%, we did observe a significant increase in the percentage of patients < 60 years old with prediabetes treated with metformin at our IM clinic. By increasing the number of patients treated for prediabetes, we hope to decrease the rate of progression to diabetes. It is also possible that raising provider awareness of prediabetes will lead to improved screening and improved early interventions. Strengths of our study include a large pre- and post- sample size and the ease of obtaining A1c levels from the electronic health record. Also, our interventions were easy to implement and could be adopted by other clinics and/or institutions.

INCREASING PREP IMPLEMENTATION IN HIGH-RISK PATIENTS SEEN BY RESIDENTS IN A PRIMARY CARE CLINIC

Heather Viola; Devorah Edelman; Surksha Sirichand; Dipal R. Patel. Mount Sinai St. Luke's-West, New York, NY. (Control ID #3174348)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

The CDC estimates that approximately 1.2 million U.S adults may benefit from HIV pre-exposure prophylaxis (PrEP), a preventive measure that has been shown to significantly reduce HIV transmission among at-risk

populations, but only a minority are using; PrEP initiation should largely originate from primary care providers (PCPs) however their knowledge of PrEP initiation guidelines and comfort in prescribing PrEP remains low.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The objectives of this resident-driven QI project were to 1) improve resident knowledge and awareness of PrEP, 2) identify high-risk individuals seen in residency clinic, and 3) refer them to a designated PrEP counselor to ultimately increase PrEP implementation rates.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Initially, a 3-year retrospective chart review was performed at a federally qualified urban community clinic to identify patients seen who were likely to benefit from a referral for PrEP initiation. Subsequently, an educational intervention, including a comprehensive lecture on the CDC clinical practice guidelines, was carried out over a 6-week period. The action phase entailed identifying patients that would benefit from PrEP at routine health visits, using the NYC-DOHMH sponsored HPLUS screening form. If the patient was identified as high risk, the provider discussed PrEP. Residents were provided with a simple PrEP initiation algorithm. Those patients amenable were then referred to a PrEP counselor and obtained initial lab testing. A follow-up provider visit was then scheduled to initiate Truvada.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The educational intervention was meant to assess and improve resident knowledge and comfort level with offering PrEP by using pre and post intervention resident surveys. During the action phase, the initiation of PrEP in high-risk patients over a 6-month period was documented in one HIPAA compliant, password secured Excel file. The initial pre-intervention retrospective chart review was then used as a comparison to this data to assess an improvement in implementation rates.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Compared to pre survey, residents surveyed post intervention (n=20) demonstrated expanded knowledge of proper candidates for PrEP (59% vs. 90%) and mandatory initial testing (34% vs. 95%). 90% felt more comfortable discussing PrEP with their patients. After initiating the action phase, 6 individuals in the first 6 months were referred to begin PrEP, representing a 6-fold increase from the 1 patient who was referred in the 6 months prior including the educational phase. This is also in stark contrast to the 3 years prior where at least 117 high-risk patients were seen and none were referred to begin PrEP. Subsequently, all 7 patients referred to the PrEP counselor were initiated on Truvada. To date, each of the patients are still taking PrEP without adverse effect and have negative follow-up HIV testing.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This QI initiative reveals that a vast majority of our high-risk population is not being offered PrEP. Our easily reproducible multimodal intervention increased PrEP referral and implementation rates.

INNOVATIONS IN TEAM-BASED PRIMARY CARE: PHYSICIAN ASSISTANT AND INTERNAL MEDICINE RESIDENT PANEL CO-MANAGEMENT

Alev Atalay^{1, 3}; Christina M. Meade¹; Caroline Cupelo²; Michele Elms²; Teresa Zhang²; Richard S. Gitomer¹; Bonnie Southworth².

¹Brigham and Women's Hospital, Jamaica Plain, MA; ²Brigham and Women's Hospital, Boston, MA; ³Harvard Medical School, Boston, MA. (Control ID #3182838)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Resident primary care physicians (rPCPs) struggle to provide continuity and complete inter-visit tasks while on inpatient rotations, thus we hypothesize that a primary care practice-sharing model between rPCPs and Physician Assistants (PAs) will improve patient outcomes.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Attending physicians (aPCPs) have superior clinical outcomes and no-show rates as compared to rPCPs. Incorporation of PAs on surgical resident teams improves patient outcomes and quality of care. Through a primary care practice-sharing model between rPCPs and PA, we aim to: 1. Improve clinical outcomes for patients of rPCPs, 2. Improve clinic engagement by reducing no-show rates for rPCPs.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Resident/PA co-management will occur at the Phyllis J. Jen Center for Primary Care (PJC), a large, academic internal medicine practice at Brigham and Women's Hospital, Boston. One team will serve as the intervention group and the PA will co-manage rPCP panels (~800 patients) while rPCPs are on inpatient rotations. Two other teams will serve as controls without co-management. The PA addresses clinical concerns, refills prescriptions, and sees patients for urgent complaints, chronic disease management, hospital discharge follow up, wellness visits, and participates in population health management. To ensure that ambulatory educational needs are met, rPCPs perform all the above during ambulatory rotations. New workflows were created to facilitate team co-management. Based on the performance measures these workflows have and will require frequent iteration.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We will measure (1) appropriateness of care metrics for diabetes, hypertension, and cardiovascular disease and age-appropriate cancer screening rates; (2) no-show rates. We compare these metrics for rPCPs and aPCPs to drive the improvement of the co-management care team operation.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Baseline data reveals poorer outcomes for rPCPs as compared to aPCPs. Across control and intervention groups, rPCP baseline rates were similar, thus rPCPs are compared as a group to aPCPs. Patients of aPCPs met appropriateness of care metrics more frequently than rPCPs, with diabetes at A1c goal (76.4% vs. 62.1%), hypertension at blood pressure goal (81.4% vs. 80.1%) and hyperlipidemia at goal (87.0% vs. 85.5%). Patients of aPCPs had higher rates of cancer screening than rPCPs (mammogram 84.3% vs. 78.0%, pap smear 79.7% vs. 68.7%, colorectal cancer screening 76.8% vs. 64.3%). No-show rate for rPCPs (17.7%) was significantly higher than aPCPs (13.2%).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Once optimized, the intent is to expand to all rPCPs at PJC and will serve as a model for other large academic practices to improve the quality of care provided to patients with rPCPs. Additionally, rPCPs uniformly felt that panel sharing is highly appealing, given the challenges of performing effective management while on inpatient rotations. We thus hope this model will improve the ambulatory educational experience.

INNOVATIVE WAY TO CREATE A PHYSICIAN SUPERVISED WEIGHT LOSS PROGRAM IN A PRIMARY CARE PROVIDER OFFICE

Varalakshmi Niranjan, University of Connecticut, West Hartford, CT.
(Control ID #3138992)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

There is limited time available in a primary care provider schedule to offer effective weight loss counselling to obese patients.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To create an effective insurance based physician supervised weight loss program in a primary care provider office setting. To assess the average number of months it takes to achieve effective weight loss of 5% or more of body weight in a physician supervised weight loss program. To assess the number of counselling office visits it takes to achieve effective weight loss of 5% or more of the body weight.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A physician supervised weight loss program was designed for a primary care provider office in a private practice setting. The program was made available for all overweight and obese patients to enroll voluntarily. The program included bi weekly outpatient office visits with the provider. Patients were provided with nutritional counselling, meal plans, exercise ideas, and behavioral therapy at each visit by the provider. Patients were provided with tools to track food intake and exercise with electronic apps and or paper journal. The patient's medical insurances were billed for these office visits with no extra cost from the patient.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The number of voluntary enrollment by the patients and dropouts were tracked annually. The demographics of the patients who enrolled in a physician supervised weight loss program were analyzed. The initial weight and monthly weights were monitored. The average time it took for a patient to lose 5% or more of body weight was determined with respect to each class of obesity. The relationship between number of visits and weight loss achieved were tracked.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A total of 126 patients were enrolled between September 2016 and August 2018. There was a 20.63% dropout noted at the end of the two year mark. The program enrolled 84.1% females and 15.9% males. A total of 1111.8 pounds were lost during the two year period. The average time it took for a patient to lose 5% or more of body weight was 2.97 months. The subgroup analysis showed obesity class 2 and class 3 patients took lesser time to achieve this weight loss in comparison to class 1 and overweight individuals. A higher percentage of class 2 and class 3 obese patients achieved 5% or more weight loss than class 1 and overweight patients. Patients who had more than 12 visits lost 7.8% of their body weight. Patients with fewer than 12 visits only lost 3.6 % of their body weight.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Physician supervised weight loss program can be designed with minimal cost investment. Effective weight loss can be achieved by counselling patients more frequently. The primary care provider schedule can be modified easily to accommodate these obese patients biweekly. The longitudinal trust with the primary care provider ensures higher follow up rates and minimal dropout rates in this program.

INPATIENT ADDICTION MEDICINE CONSULTATIONS AT THE URBAN/RURAL FRONTIER: IMPROVING QUALITY OF CARE AND LINKAGE TO OUTPATIENT SERVICES FOR PATIENTS WITH SUBSTANCE USE DISORDER IN CENTRAL KENTUCKY
 Devin Oller¹; Laura Fanucchi². ¹University of Kentucky, Lexington, KY;
²University of Kentucky College of Medicine, Lexington, KY. (Control ID #3181470)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Does an addiction medicine consult service facilitate opioid use disorder(OUD) medication initiation and linkage to outpatient services in an academic medical center serving both urban and rural areas?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Provide timely consultations for individuals with substance use disorders(SUD) admitted to hospital medicine teams Secure linkage to outpatient treatment for consult patients

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Addiction Consultation and Education Service(ACES) began 10/4/18 at the University of Kentucky Hospital, a 945-bed tertiary referral academic medical center with more than 3000 opioid-comorbid encounters in 2018. ACES was available on weekdays to 16 inpatient hospital medicine teams. The team was comprised of several physicians and an APRN. A patient navigator assisted with prior authorizations and outpatient linkage. ACES referred to UK First Bridge Clinic for office-based opioid treatment as well as community programs when possible.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Patient demographics, SUD diagnoses, insurance, and comorbidities will be collected, as well as key process metrics including: time-to-consultation and medication initiation, length of stay(LOS), discharge against medical advice(AMA), and details of linkage to outpatient services (type, travel distance, and time-to-follow-up)

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): ACES was staffed by a single physician seeing an average 1.7 new consults/day. Of the 91 patients seen by ACES over the first 3 months of the service, 73 of consults met DSM-5 criteria for OUD or OUD plus an additional SUD, 10 for stimulant use disorder, and 8 for alcohol use disorder. 58% of patients lived in rural counties (Rural-Urban Continuum Codes 4-9). Average LOS was 19.5 days; consult orders were entered an average of 5.8 days after admission. Medication treatment for SUD was initiated in the majority of ACES patients, with medications started an average of 0.9 days after consultation. Among OUD patients, 71% underwent buprenorphine/naloxone (BUP/NX) induction, 9% were started on methadone, and 20% did not receive medication. Of patients started on BUP/NX 58% were linked to the UK First Bridge Clinic.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Establishing a bridge clinic prior to the implementation of an inpatient consult service is critical. ACES relied heavily on the UK First Bridge clinic for patients started on BUP/NX—waiting lists and costs made linkage to closer clinics difficult. Compared to other addiction medicine consult services, a greater percentage of patients seen by ACES resided in rural counties.^{1,2}To address transportation barriers, we are evaluating options for initiating depot buprenorphine for ACES patients. While ACES plans to increase staffing, our pilot demonstrates that services with minimal staff can increase the number of inpatients receiving medications for OUD. 1.Priest et al. Role of the Hospital in the 21stCentury opioid overdose

epidemic: the addiction medicine consult service *JAM* Dec 2018 2.Trowbridge et al. Addiction consultation services:Linking hospitalized patients to outpatient addiction treatment *J Subst Abuse Treat*.2017;79:1-5

INTEGRATING BEHAVIORAL HEALTH INTO PRIMARY CARE: MAKING A PATIENT WHOLE

Divya Venkat¹; Herman Singh²; Bruce Ling²; Courtney Watson²; Maggie Feinstein²; Elizabeth Cuevas². ¹Allegheny General Hospital, Pittsburgh, PA;
²Allegheny Health Network, Pittsburgh, PA. (Control ID #3183916)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Patients with significant mental health diagnoses have a shorter life span, often in the setting of poorly managed and underrecognized co-existing medical illnesses.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To evaluate the utility of the integration of behavioral health into the primary care setting.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The setting of this study occurs at two clinics affiliated with a residency program. One clinic meets the needs of a low-income neighborhood with a variety of age ranges while the other serves an upper middle class neighborhood with a predominantly middle-aged population. Behavioral health specialists were integrated into these clinics in July 2015 and January 2017 respectively. Medical assistants first speak with the patients and obtain a PHQ-2. Based on this value, residents will perform a PHQ-9 and address the initial issues of behavioral health. Based on this, the behavioral health specialist will speak with the patient and recommend treatment strategies or further assessment by a psychiatrist. Residents will then begin medications in the clinic or speak directly with the psychiatry outpatient clinic.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): In this quality improvement project, behavioral health specialists were integrated into the above mentioned residency clinics. Data was collected on the following: (1) number of visits made to the behavioral health specialist, (2) the frequency of clinic visits in which depression screening with the Patient Health Questionnaire (PHQ) occurred, and (3) the number of referrals made to outpatient psychiatry.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The primary analysis is the assessment of the number of referrals to outpatient psychiatry prior to the integration of the behavioral health specialist compared to the post-integration period as evaluated in monthly time periods. At the residency clinic located in the low income neighborhood, there was a decrease in the number of referrals in the post-integration period (a low of n=6 in the assessed month) when compared to the pre-integration period (n=32). In the upper middle class neighborhood clinic, there were 33 referrals to psychiatry during the month in which the behavioral health specialist was integrated. At this clinic, there has been a gradual decline in the number of referrals to a low of 13. After institution of BHI, a target of 80% of all patients were screened for PHQ-9. Furthermore, there have been over 140 visits per month consistently to each behavioral health specialist.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Integrating behavioral health specialists within primary clinic gives patients a well-rounded care approach. Patients who cannot obtain adequate mental health care are able to reach out to a behavioral health

specialist while primary care physicians can continue to address other chronic medical conditions. Primary care physicians are then able to more adequately assess the impact of behavioral health concerns on a patient's chronic conditions. Further work needs to be done to assess the impact of this on chronic conditions, such as management of diabetes mellitus and hypertension.

INTEGRATING GROUP THERAPY FOR BEHAVIORAL HEALTH INTO A PRIMARY CARE PROGRAM FOR PATIENTS WITH COMPLEX MEDICAL AND SOCIAL NEEDS: A PILOT.

Venkatesan R. Krishnamoorthi; Nicole Gier; Emily Perish; David Meltzer.
University of Chicago, Chicago, IL. (Control ID #3186262)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Individuals with complex medical and social needs often have behavioral health (BH) problems that impair their ability for self-care, but rates of referrals for and attendance at BH specialists' appointments are low.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Develop a group therapy approach to BH integrated into and led by members of the primary care clinic. 2. Improve the rate of BH care through attendance at group therapy sessions, over conventional referrals to BH specialists outside of the clinic.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

The Comprehensive Care Program (CCP) at the University of Chicago provides continuity care for Medicare patients at high risk for hospitalization in both outpatient and inpatient settings. The team includes a licensed clinical social worker with training in BH care. Multi-disciplinary rounds occur daily, allowing referral patients for BH care via warm hand-offs. Noting the common challenges among CCP patients in attending appointments, a BH group therapy program was created due to several advantages over individual therapy: a safe space for those not comfortable with psychotherapy; support from peers with similar health and social problems; more efficiency for providers. Patients who expressed interest were enrolled and scheduled into a 5 week group therapy module. Participants are encouraged to establish personal goals and are taught skills of mindfulness, emotion regulation, distress tolerance, interpersonal effectiveness, and self-compassion. In order to accommodate barriers to attendance (e.g. illness, transportation) participants are allowed to drop in to the group throughout the year.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We compared the attendance rate of enrollees in the CCP group therapy program to the same enrollees' referral rate and attendance rate to BH specialists' appointments outside of the CCP program (psychiatry or psychology at Univ of Chicago or other institutions). We performed a retrospective chart review of those enrollees to investigate 1) who attended at least one CCP group session, 2) who had been referred to a BH specialist in the prior 12 months, and 3) who had attended at least one BH specialist appointment in the prior 12 months.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Twelve patients expressed interest and were scheduled into a 5-week group therapy program. Ten were female, the average age was 61, all were African-American. Of these, six (50%) attended at least one group session. Of the twelve, six had been previously referred to a BH specialist outside of CCP in the prior 12 months, but only two (33%) had attended an appointment. Of the six who attended a group session, only two had been previously referred for outside BH care (33%), and only one attended their appointment (17%). Among the six who enrolled in CCP

group therapy but did not attend, four had been previously referred but only one actually attended an outside BH specialist (17%).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Integrating a group therapy approach to BH care into a program for high-risk patients with high rates of BH problems may improve attendance for at least their first experience with BH care.

INTEGRATING PREDICTIVE ANALYTIC RISK TOOLS FOR IMPROVEMENT IN UTILIZATION OF CARE MANAGEMENT RESOURCES IN THE PRIMARY CARE SETTING

Bethany D. Corbin¹; Shalom Schlagman¹; Alice Baker¹; Enrico Caiola¹; Angela K. Nagel²; Amanda M. Ramos¹; Robert J. Fortuna¹. ¹University of Rochester, Rochester, NY; ²St John Fisher College, Rochester, NY. (Control ID #3185814)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

The average primary care physician cares for about 1,700 patients, but has limited access to finite care management resources, leading to a necessary area for improvement on how to evaluate risk within large populations, and identifying potential tools and processes to efficiently guide the allocation of care management resources to most appropriately meet patients' needs.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Implement a system for identifying patients for whom care management may improve clinical outcomes, using predictive analytic tools in addition to clinical judgment 2. Monitor the average aggregate risk score for patients under care management 3. Decrease the number of ED visits and hospitalizations for patients under care management

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): In our outpatient residency practice, we implemented an operational process and predictive analytic tool to identify patients at risk for ED visits or hospitalization, for whom early intervention with care management may reduce this overall risk. This predictive analytic model was developed by Epic over 7 years using data from 345,000 patients. The model identified 19 variables that were predictive of a patient's risk for ED visits or hospitalization, and provides a score between 0 to 100 that correlates to the risk of ED visit or hospitalization within the next year. Validation of the tool yielded an average C-statistic of 0.71. In conjunction with this analytic tool, the operational process engages clinical teams to assess the potential of care management to impact the outcome (impactability). This impactability aspect includes consideration of a patient's medical factors (e.g. health conditions, adherence) and social determinants (e.g. health literacy, housing, transportation).

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Process measures include number of patients enrolled in care management, risk score of enrolled patients, and improved monitoring parameters of medical condition (e.g. A1c, BP control) 2. Outcome measures include increasing the average risk score of patients under care management, and decreasing the number of managed patient ED visits and hospitalizations

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Currently, 134 patients are enrolled with care management. The baseline average risk score of patients enrolled in November, 2018 was 33.4%. More than half of enrolled patients had a score less than 30%. Over the first 2 months of this intervention, the average risk

score of patients enrolled in care management has increased to 40.4%, reflecting an increase risk of the changing cohort of patients. Further analyses will be completed after additional data are collected.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): An operational process guided by predictive analytics and clinical judgement can help direct the allocation of care management resources within a residency practice. In the first 2 months of this intervention, the patient population under care management evolved to include higher risk individuals. With further implementation of this system, we hope to increase the average risk score for patients under care management to 60% by June 2019.

INTER-PROFESSIONAL INTEGRATION IMPROVES THE PRIMARY CARE TO PHYSICAL THERAPY REFERRAL PROCESS

Sharen E. McKay¹; Frank D. Buono²; Jennifer Walker³; Carly Croteau⁴; Destiny Printz⁵; Rebecca Brienza⁶. ¹Yale University School of Medicine, West Haven, CT; ²Yale School of Medicine, New Haven, CT; ³Veterans Hospital West Haven CT, Derby, CT; ⁴US Department of Veteran Affairs, West Haven, CT; ⁵Veterans Affairs Connecticut Healthcare System, West Haven, CT; ⁶VA Connecticut Healthcare System, West Haven, CT. (Control ID #3176647)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Musculoskeletal (MSK) pain has been estimated to comprise 20-25% of patient complaints in the primary care (PC) setting resulting in many referrals to physical therapy (PT); however, the referral system can include long wait times and discontinuation of care necessitating new delivery methods.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The objective of the program is to improve PT delivery by integrating physical therapists in an interdisciplinary patient-centered, team-based care medical home (PCMH) model in a VA ambulatory care training clinic.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The VA Health Administration's Centers of Excellence in Primary Care Education (COE) are interprofessional post-graduate training programs in primary care that integrate providers of different professions in a PCMH model. There are COEs at seven VA sites nationally and all include physician, nurse practitioner, health psychology, and pharmacy trainees and faculty. The West Haven, CT COE has additionally integrated physical therapy faculty who participate in co-precepting, enabling direct "warm handoffs" from a PC provider to a PT when patients arrive with MSK complaints.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): To evaluate the efficacy of this model we tracked the numbers of PT referrals, the number of completed referrals, the numbers of discontinued/cancelled (D/C) appointments, and the wait time between referral and encounter. The listed PT referral parameters were monitored for 3 years (FY2015-2017) and were compared between the COE training clinic and two other PC training clinics at the same VA site (Firm A and Firm B.) where PT referrals are done in the traditional manner.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Over three years there was a 64% increase in referrals for COE, an increasing trend of 35% in Clinic A, and decreasing trend of -0.8% in Clinic B. The COE showed a steady decline in D/C PT referrals and steady increase in completed PT encounters. The other Firms

showed different patterns of change in completed and D/C visits over the same time. The average wait time for a PT appointment was considerably shorter in COE than either of the other Firms beginning in FY2015 (mean=18.1 days COE vs. 45.2 days Firm A vs. 28.7 days Firm B) and the COE trend continued downward in FY2016 and 2017. Patients gave high ratings to seeing a physical therapist, receiving a home exercise program, and/or receiving equipment such as a cane, walker, rollator, or TENs unit on the same day as their PC appointment.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): PT Integration in a PC setting increases overall PT referral, enhances completion of PT referrals and reduces wait times for appointments. We can only speculate on the mechanisms for these improvements but they may include enhanced awareness and knowledge of MSK complaints by PC providers who regularly interact with PTs, improved diagnosis of MSK issues by co-precepting and warm-handoffs, and a "jump-starting" effect on PT made possible by preliminary interventions made at the time of the warm-handoff where PT providers can recommend home exercise programs and provide equipment.

INTERDISCIPLINARY COMMUNICATION PROJECT: USING GROUP LEVEL ASSESSMENT TO GUIDE HEALTHCARE SYSTEM IMPROVEMENT

Ashley Jenkins^{1, 2}; Andrew Arken³; Jennifer Jasmine E. Arfaa³; Danielle L. Clark¹; Katherine Clark¹; Emily Dobbs¹; Betina Lahbabi³; Brian May^{1, 2}; Sriyutha Reddy¹; Sana Rockwell³; Jamie Tu³; Danielle Weber^{1, 2}; Katherine Clarke-Myers². ¹University of Cincinnati Medical Center, Cincinnati, OH; ²Cincinnati Children's Hospital Medical Center, Cincinnati, OH; ³UCHealth, Cincinnati, OH. (Control ID #3182299)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Communication failures amongst interdisciplinary internal medicine (IM) teams in the inpatient setting inhibit mutual understanding of care plans, increase the potential for medical error, and contribute to patient dissatisfaction.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Conduct a Group Level Assessment (GLA) to assess facilitators and barriers of effective communication within interdisciplinary inpatient IM teams 2. Use results from GLA to identify and prioritize development of future interventions to facilitate communication

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Efforts to enhance interdisciplinary collaborative teamwork within inpatient IM teams highlighted a critical need to address concerns related to communication among IM teams. We used GLA, a participatory qualitative method, to examine current barriers and facilitators of effective communication. GLA follows a structured process designed to engage diverse groups of stakeholders in the inquiry process. Our recruited stakeholders were IM faculty, residents, nurses and ancillary staff, patients/families, and care managers who work or have experienced care on inpatient IM teams at an 800-bed tertiary academic hospital. Participants attended discipline-specific GLA sessions. During the sessions, participants first responded individually to open-ended prompts addressing interdisciplinary communication (e.g. Ideal methods of communication include). Following generation of individual responses, participants worked in small groups to synthesize the qualitative data, identify key themes, and reach consensus on priority improvement areas.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Key features of success when using a participatory approach are enhanced participant involvement, production of meaningful results, confirmation of mutual values, and increased commitment to future action. We successfully recruited at least 15 participants per stakeholder group (total n =104): patients and families (18%); IM faculty (22%), IM residents (29%); nurses and other ancillary staff (e.g. unit coordinator, 15%); and care managers (16%). Future success measures include validating thematic analysis with stakeholders and utilizing data to drive improvement work in the inpatient setting.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Stakeholders identified several themes related to interdisciplinary communication: 1) patient and family inclusion; 2) shared mental models and expectations; 3) execution of communication (modalities); 4) access to essential information; 5) cultural and behavioral components of an optimal environment; 6) role of communication in patient outcomes. Further evaluation will look specifically for overlap and divergence of themes and subthemes.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Understanding current state of effective interdisciplinary communication will allow the design of contextually-relevant interventions to improve patient care and outcomes on inpatient IM teams. Demonstrating feasibility of using a structured participatory approach in the inpatient setting shows that this method can be employed and adapted at other institutions to facilitate interdisciplinary collaboration and engagement.

INTERPROFESSIONAL MANAGEMENT OF OBSTRUCTIVE LUNG DISEASE IN AN URBAN PENNSYLVANIA FREE CLINIC FOR THE UNINSURED

Christopher C. Marino¹; Theo Pham²; Sharon E. Connor²; Mary Herbert¹; Thuy Bui¹; Faraaz A. Shah¹. ¹University of Pittsburgh Medical Center, Pittsburgh, PA; ²University of Pittsburgh, Pittsburgh, PA. (Control ID #3163115)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Low-income uninsured patients face numerous barriers to optimal management of obstructive lung disease and have a higher prevalence of asthma and chronic obstructive pulmonary disease (COPD).

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The Birmingham Free Clinic (BFC) aims to provide access to high-quality care and timely diagnosis for uninsured patients with obstructive lung disease in an interprofessional free clinic setting.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Comprehensive pulmonary care at BFC includes a smoking cessation program, pharmacist-driven medication therapy management clinic, medication assistance programs, and a specialty pulmonary clinic with on-site spirometry offered every three months. This project identified patients with poorly-controlled obstructive lung disease and explored associated contributing factors.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): A retrospective chart review was performed for all patients seen at the clinic with a diagnosis of asthma or COPD from January 2016 to June 2018. Cases were identified using ICD-10-

CM diagnostic codes. A case report form was applied to abstract data on demographics, tobacco use, spirometry, medications, emergency department visits, and hospitalizations. Patients were classified as uncontrolled if chart review revealed: (1) daily albuterol inhaler use, (2) nighttime awakening, (3) functional limitations, or (4) emergency department visits or hospitalizations due to obstructive lung disease within the past year.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A total of 106 adults (age 45 ± 15 years, 51% female) presented with obstructive lung disease over the 30-month period (asthma 75%, COPD 21%, combined asthma-COPD 4%). Seventy (66%) had no documented spirometry testing, demonstrating spirometry underutilization and reliance on clinical assessment for diagnosis. Forty-six (43%) reported ongoing tobacco use and nineteen (18%) reported former tobacco use. Twenty-nine (27%) had uncontrolled disease. Factors associated with poor control included active tobacco use ($p=0.04$), older age ($p=0.03$), male sex ($p=0.01$), and a diagnosis of COPD or combined COPD-asthma ($p<0.01$). Race and body mass index did not significantly differ between controlled and uncontrolled groups. Suboptimal control of obstructive lung disease resulted in 58 emergency department visits and 15 hospitalizations. A minority of patients (27%) continued to follow regularly at the clinic into 2018.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Management of obstructive lung disease in an uninsured population presents unique challenges as patients are at high risk of fragmented care and have limited access to diagnostic spirometry and appropriate therapy. This quality improvement study identified targets to optimize care in a free clinic setting including enhanced inter-visit follow up, pharmacist-assisted management, improved access to on-site spirometry, increased tobacco cessation efforts, and incorporation of validated assessment tools in asthma and COPD care.

IT TAKES A VILLAGE—AMBULATORY INTERDISCIPLINARY ROUNDS TO ADDRESS HIGH COST-HIGH NEED PATIENTS

William Carroll; Sun Yoo. UCLA, Los Angeles, CA. (Control ID #3185880)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): High cost-high need patients require intensive care coordination to address medical and social complexity, but traditional primary care models do not provide an efficient structure for interdisciplinary discussion to craft comprehensive care plans that address drivers of utilization.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Perform a root cause analysis to determine underlying drivers of inpatient hospital admissions and emergency room visits. Provide a venue for interdisciplinary development of individualized complex chronic care management plans for high risk patients in order to decrease preventable hospital admissions and 30-day readmissions. Stratification of specific tasks to appropriate team member who will serve as the point of contact between the medical team, community stakeholders and the patient to minimize redundancy and allow members maximize clinical licenses.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): An interdisciplinary team consisting of 4 internal medicine extensivist physicians, 1 nurse practitioner, 1 registered nurse (RN), 1 clinical pharmacist, 1 comprehensive care coordinator (CCC), 2 patient service representatives (PSR), 1 hemodialysis coordinator, and 1 social worker meet weekly to evaluate previously identified cases to evaluate pertinent social determinants of health to stabilize chronic disease management in patients identified as a high utilizer.

Inclusion criteria includes 2 or more inpatient hospitalizations within a six-month period or 3 or more emergency room visits in a six-month period. Various community stakeholders are invited to participate in patient discussion including home health agencies, hemodialysis center representatives and behavioral health representatives. During discussion, interventions are stratified to various members of the interdisciplinary team.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Number of individualized care plans created and qualitative evaluation of the effectiveness of interdisciplinary rounds for patients in a 12-week period. 30-day hospital readmissions following creation of care plan in interdisciplinary rounds.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 75 patients were discussed in 12 conference sessions with creation of 75 individual care plans. Patients discussed were evaluated for subsequent interventions in care coordination tasked to appropriate team members. 61.3% of patients required RN clinical follow-up, 54.7% of patients required CCC intervention, 32% of patients required PSR administrative intervention, 12% of patients required social work intervention and 8% of patients required hemodialysis coordination intervention. 36% of patients discussed were readmitted within 30 days of discussion.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Chronic care management for high utilizer patient population requires the input of interdisciplinary team in order to address the social determinants of health that impact chronic underlying diseases. Interdisciplinary review of high need-high cost patient populations identifies both clinical and non-clinical interventions to chronic disease management to address social determinants of health, symptom control and subspecialty care.

LOW-BARRIER INITIATION OF BUPRENORPHINE FOR TREATMENT OF OPIATE USE DISORDER AT HOMELESS ENCAMPMENTS: MEETING PEOPLE WHERE THEY ARE AT

Michael Incze¹; Soraya Azari²; Deborah Borne³; Rebecca Pfeifer-Rosenblum³. ¹University of California, San Francisco, San Francisco, CA; ²University of California, San Francisco, San Francisco, CA; ³San Francisco Department of Public Health, San Francisco, CA. (Control ID #3160049)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Though access to medication assisted treatment for opioid use disorder is widely available in San Francisco, barriers such as transportation, stigma and lack of social supports prevent a significant number of high risk individuals from receiving treatment.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Our intervention was to offer low-barrier, same-day initiation of medication assisted treatment (MAT) with buprenorphine-naloxone with prompt connection to care at monthly pop-up health fairs located at a rotating group of homeless encampments in San Francisco.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A multidisciplinary group of health care providers and community non-profits organize monthly health fairs at a rotating group of homeless encampments around San Francisco. Participants were routinely screened by medical providers for opioid use disorder and assessed for readiness to start MAT. For those who desired to start treatment with buprenorphine-naloxone, California's state PDMP was checked onsite using mobile devices, and a 2-3 day prescription was called in at the prescribing provider's discretion to a partnering

pharmacy with expertise in harm reduction and MAT. No utox was required for the initial prescription. Follow up was arranged at one of three local walk-in treatment centers based on proximity and patient preference. The state PDMP and the SFDPH electronic health record were used to monitor follow-up

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Our primary measure was the percentage of patients who filled a prescription and attended at least one follow up visit. Secondary measures included the percentage of patients who remained in treatment at six months, the total buprenorphine-naloxone prescriptions at each event, and qualitative feedback from trainees.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): After 12 months, 23* people received new prescriptions for buprenorphine-naloxone on-site, of which 37% attended at least one follow-up visit. 14% were still in treatment at six months. 45% of patients prescribed buprenorphine-naloxone never picked up a prescription or had a documented follow up visit in the electronic health record. The total number of buprenorphine-naloxone prescriptions at each event has increased. Qualitative feedback from trainees was positive. *Please note that we have new data for the past six months that will be incorporated into the presentation, with a total number of bupe starts now at ~60.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Low-barrier, on-site initiation of MAT of opiate use disorder was effective in connecting a substantial number of people from a marginalized and hard-to-reach population with a high prevalence of opiate use disorder to treatment. As San Francisco invests in resources to address the opiate epidemic, street-based outreach will remain an important mode of connecting with people who inject drugs that may not utilize existing infrastructure for accessing treatment because of stigma and significant psychosocial barriers. Next steps include improving attendance at follow up visits and retention in treatment by developing more intensive patient navigation resources at future events.

MAKING PRIMARY CARE NEIGHBORHOOD CARE

Elizabeth Jacobs^{2, 1}; William M. Tierney^{2, 1}; Brandon Allport^{1, 2}; Alexandra Garcia^{2, 1}. ¹University of Texas at Austin, Austin, TX; ²Dell Medical School, University of Texas at Austin, Carmel, IN. (Control ID #3181837)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Primary care providers increasingly recognize that zip-code is a more important determinant of health than a person's genetic code.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) To understand and address the medical and social determinants of health in a geographic neighborhood in Austin, TX. 2) To develop an innovative primary care delivery program that addresses the medical and social needs of patients.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We have developed and are in the early stages of implementing Dell Med School's Neighborhood Health Initiative. Its 3 main components are: (1) a partnership with a Federally Qualified Health Center; (2) partnerships with community-based organizations in our target neighborhood; and (3) the household level health needs assessments (HoLA). Using data from HoLA and our community and FQHC partner, we have developed a plan to connect families to primary care and social services to address barriers to health identified by residents.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We will assess success by (1) establishment of trusting, productive relationships with our FQHC, community partners and neighborhood residents; (2) increasing numbers of neighborhood residents engaged with primary care; (3) number of residents with whom the community health worker has established a relationship and the number of referrals to services they have made; and (4) the well-being and health of residents served.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): To date we have established successful community partnerships and a clinical partnership in the neighborhood, including co-hiring a medicine-pediatrics physician. We collected data from over 100 diverse households: 64% identified as Latino and 25% Black, 55% self-reported as immigrant, and most were uninsured (23%), received Medicaid (21%), or covered by a gap coverage provided by the local Health District (33%). Only 65% were engaged with primary care and 23% did not access any medical services in the past year. Residents faced a number of challenges: A third had difficulty meeting expenses every month, 42% worried about not having enough food, almost 20% said their health was diminished by concerns about immigration and deportation, 10% were affected by racism and discrimination, and 10% by crime, grief, and violence. Top requests for services were for dental services (32%), vision care, mental health, assistance with paying for medications, accessing health care, and housing (about 25% each), and legal services (10%).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Thinking outside the box to improve the health of a community requires addressing both social and medical needs, partnering with community social and medical service providers, and listening to and being open to residents' needs. All of this takes time and a willingness to partner across sectors and organizational cultures.

MEDICAL ASSISTANT PROFESSIONALISM PROGRAM BRINGS EDUCATION, TRAINING, COMMUNITY AND CAREER SATISFACTION TO AN INDISPENSABLE WORKFORCE IN PRIMARY CARE

Rachel Haft¹; Karen Victor¹; Meredith Hobson¹; Beth A. Lown¹; Andrew Curran¹; John D'Angelo³; Diane Shapiro³; Valerie E. Stone². ¹Mount Auburn Hospital, Cambridge, MA; ²Mount Auburn Hosp, Harvard Medical School, Cambridge, MA; ³Mount Auburn Cambridge Independent Practitioners Association, Brighton, MA. (Control ID #3185887)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The Medical Assistant (MA) profession has entered an era of expanding competencies and expectations, yet MA education is not customized to primary care practice, standards do not exist to ensure that postgraduate education and training parallel advances in clinical care, and healthcare organizations miss an opportunity to improve MA satisfaction and retention through the dignity of educational investment and community-building among this workforce.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We built a Medical Assistant Professionalism Program to deliver education and training of high value to our primary care MAs and to evaluate their satisfaction with the program's first year.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Our

11 primary care clinics employ approximately 40 MAs. We convened focus groups to ascertain what motivated the MAs in their work, tally their self-identified strengths and ideas, and formulate a high-value curriculum. Sessions were moderated without supervisors or providers present, to promote frank discussion. We then divided our workforce into three cohorts to stagger clinic staffing and bring MAs from different clinics together for cross-fertilization. Each cohort attended four 1.5 hour classes, held at 3-month intervals. Curricula included advanced blood pressure measurement, cancer screening, EMR workflows, nuances of glucose testing, PlanDoStudyAct (PDSA) training for the primary care setting, and Service Excellence topics aimed at patient experience.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The majority of MAs, individually and in teams, designed and implemented PDSA projects to address issues of personal interest and reported back to their respective cohorts. Also, participants were surveyed at each session to assess satisfaction with programming and its potential impact on their work.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Several MA-designed PDSA exercises yielded positive results in primary care delivery. One project effected 20% improvement in fecal immunochemical test completion. Another PDSA reconfigured the demographic data collection process as a more patient-centric experience, elevating participation to 100%. MAs reported feeling that programming had been designed specifically with them in mind (89.5%); they considered the covered topics clinically relevant to their work (94.4%) and reported that the sessions would change how they care for patients (82.8%). They positively rated the quality of presentations on Service Excellence (94.5%) and all other topics (96.6%). This is the program's second year.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A Medical Assistant Professionalism Program offers a venue for primary care MAs to continue their medical education and build community, resulting in a high level of satisfaction for this workforce and with significant potential benefits for their contributions to primary care practice. Healthcare systems that deliver primary care services could leverage such programming to meet their obligations of MA recruitment, competency advancement, and patient and provider satisfaction. Furthermore, we believe this program can contribute to improved MA retention; data analysis is underway.

MILE HIGH PROBLEMS: IMPROVING TURNAROUND TIME FOR NEW HOME OXYGEN ORDERS

Cody Dashiell-Earp¹; Edward Collins¹; Carmen L. Lewis². ¹University of Colorado, Denver, CO; ²Univesrity of Colorado, Denver, CO. (Control ID #3184873)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Although providers and staff in our practice spent at least one hour on paperwork for every new oxygen order, the average time to fulfillment was 12.7 days, leading to poor health outcomes for patients and significant frustration.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Reduce the average time to fulfillment of an oxygen order by 50%. Reduce the amount of time spent by physicians completing paperwork for new oxygen orders. Improve patient, provider and staff satisfaction with the oxygen ordering process.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

Due to our location in Denver, Colorado, our outpatient internal medicine practice has an unusually high burden of new oxygen orders, with an average of 20 new orders per month. Since most Medicare patients seen in our office are contracted with just one oxygen vendor, there is little incentive for this vendor to improve customer service. The 18 providers in our office and the medical assistants (MAs) and nurses (RNs) that support them each had a different process for initiating an oxygen order, variable familiarity with the requirements for such orders, and no standard way of following up with vendors to ensure the order was fulfilled. To solve this problem, two MAs were designated as oxygen specialists and given 0.2 FTE to work on this task. They met in person twice a week with a representative from our primary oxygen vendor to review the status of oxygen orders and once a month with practice leadership to review performance data.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Our primary outcome was the number of days between the first oxygen order and the delivery of oxygen to the patient's home. We also performed qualitative interviews to assess the satisfaction of our physicians, the MAs who worked on the project, and the MAs who were not involved in the project.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The average time to fulfillment of a new oxygen order dropped from 12.7 to 5.4 days and has been sustained for 2 months. This means that for every hour our MAs work in this capacity, they reduce the time our patients wait for oxygen by 2.2 days. Qualitative interviews with providers and staff have revealed that both the MAs who became our oxygen specialists and the MAs who no longer need to spend time on oxygen orders are highly satisfied with this new workflow. Provider satisfaction has increased slightly, however there continue to be frustrating delays for oxygen order renewals and CPAP orders, which were not the focus of this project.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The oxygen ordering process is too complex to be managed efficiently on a case by case basis by all members of the primary care team. Creating an oxygen specialist for a practice can dramatically reduce the time it takes to fulfill a new oxygen order and the paperwork burden on providers and staff. In a non-competitive oxygen marketplace, exchanging performance data and best practices with the primary oxygen vendor improves accountability and turnaround time.

MYTHBUSTERS! IMPROVING INFLUENZA VACCINATION RATES IN AN URBAN UNDERSERVED RESIDENT PRACTICE USING TARGETED EDUCATIONAL INTERVENTION

Helen Cha^{1,2}; Filip Oleszak^{1,2}; Ahmed Awwad^{1,2}; Hira Chaudhary^{1,2}; Lucas Dreamer^{1,2}; Melissa S. Lee^{1,2}; Andrew A. Chang^{1,2}; David L. Stevens^{1,2}.

¹NYC Health + Hospitals/Kings County, New York, NY; ²SUNY Downstate Medical Center, Brooklyn, NY. (Control ID #3171379)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Will influenza (flu) vaccination rates improve by targeting patient concerns and providing standardized educational information?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To increase flu shot administration rates by 10% from our practice's usual care (67%) over two months (October-December 2018)

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

The resident primary care practice serves a predominantly Afro-Caribbean urban underserved population in Brooklyn, NY. All patients were offered the flu vaccine. Those that declined were engaged in conversation based on the CDC "No More Excuses: You Need a Flu Vaccine" fact sheet. Most common categories of declination reasons were: - The flu vaccine can give me the flu. - I do not need to get the flu vaccine every season. - I can wait to get vaccinated. - The flu vaccine is not 100% effective/protective. Residents were educated on the most common reasons for declination and targeted educational interventions based off the fact sheet addressed each patient's specific concern. The number of patients who converted to accepting vaccination was recorded. Patients with reasons other than the above were excluded from the study.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The percentage of patients who converted to accepting the flu vaccine following the intervention.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The flu vaccine was offered to 71 patients, 37 patients (52%) accepted, 34 patients (48%) initially declined. Of these 34 patients, 23 (68%) patients converted to accepting flu vaccination following the targeted educational intervention. In total, 60 out of 71 patients (84%) ultimately accepted flu vaccine administration. Our intervention had an absolute improvement of flu shot acceptance of 17% over usual care (67% in our practice the previous year). 34 patients were surveyed on reasons for declination, with the following results: 15 patients (44.1%) "The flu vaccine can give you the flu." 9 patients (26.4%) "The flu vaccine is not 100% effective/protective." 6 patients (17.6%) "I can wait to get vaccinated." 4 patients (11.7%) "I do not need to get the flu vaccine every season." 6 patients (17.6%) "Other reasons." These patients were excluded from the study.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Patients decline influenza vaccination for a few common reasons as mentioned above. By identifying and addressing each patient's particular concern, and by using a focused standardized educational intervention, physicians can improve vaccination rates.

NICE TO NOT MEET YOU! ELIMINATING BARRIERS TO PRIMARY CARE FOR HOUSE STAFF THROUGH NO-VISIT ESTABLISHMENT

Dan Henderson; J. B. Crocker; Emily Shipp. Massachusetts General Hospital, Boston, MA. (Control ID #3184482)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

For residents and fellows seeking primary care, long wait times for new patients, tight clinical schedules, and the universal requirement of an initial visit pose significant barriers to establishing care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Create a new pathway to safely establish primary care without an initial visit. 2. Decrease delays in obtaining primary care for house staff. 3. Increase the proportion of internal medicine residents with a primary care physician.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Our office is a hospital-affiliated primary care practice with a special mission to provide high-value care to hospital employees and their family members.

Many of our patients are residents and fellows, who carry a significant burden of stress-related symptoms and conditions, as well as reduced access to primary and preventive care due to competing demands. Given the pressures on residents and the critical roles they play in hospital operations, we sought to bridge the gap between the care residents need and the care they get. Across our institution, the average wait for a new patient visit was 44 days, and so many house staff are unable to establish care without taking a vacation. Since they tend to be medically well and health savvy, we sought to use a questionnaire to triage need for visit, and create a pathway to non-visit empanelment. We designed the questionnaire to elicit a variety of needs, including routine prevention, physical or behavioral symptoms, and sexual health. We also built in mechanisms for patients to request routine and recommended testing without needing to be seen. We intended to make the program available to all housestaff, but were limited by logistical issues to the internal medicine residents and fellows. We announced the program as part of intern orientation and through department communications.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Number of residents establishing care in the first six months of the pilot, compared to the previous year. 2. Median time in residency before establishing care, compared to those establishing in the previous year. 3. Proportion of patients who establish care without a visit.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The program was implemented June 21st, and so we have only recently passed the six month time point. As such, the analysis is ongoing at the time of submission. Initial results show that 36 interns established care in that time period, though this likely underestimates the total, as it reflects only those actively counted by one PCP. We are currently analyzing appointment and panel data against the roster of residents. The questionnaire appeared to function well, and correctly identified a handful of patients with significant medical or behavioral health issues, based on historical vital signs or standard questionnaires.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A well-designed questionnaire, applied to the right population, may be a safe alternative or supplement to the standard establishing visit. We intend to continue the program and explore expanding the questionnaire to other populations.

OD IN THE ED: A TEAM-BASED APPROACH TO THE OPIOID EPIDEMIC

Divya Venkat¹; James Bruce¹; Bruce Ling²; Courtney Watson¹. ¹Allegheny General Hospital, Pittsburgh, PA; ²Allegheny Health Network, Pittsburgh, PA. (Control ID #3183904)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Opioid overdose is one of the leading causes of death in the United States.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To evaluate the initiation of buprenorphine in the emergency department to patients who present following an opioid overdose and high risk opioid use.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): This healthcare innovation occurs in a community based hospital in an urban part of Pittsburgh. This hospital serves a significant number of low-income patients with a history of illicit opioid use. Due to the hospital's location, its

emergency department treats a large number of opioid overdoses and high risk patients. Within the hospital, the Addiction Medicine team collaborates with the Emergency Department on an Opioid Use Disorder Initiative to treat those with opioid use disorder. Through this initiative, patients who are seen in the emergency department and are diagnosed with opioid use disorder are offered a dose of buprenorphine to transition patients to opioid replacement therapy. This dose is given either by the Emergency Department providers or through a referral to the Addiction Medicine team. Following this dose of buprenorphine, a warm hand off is provided to the Medication Assisted Treatment (MAT) clinic via the emergency medicine physician or through the Addiction Medicine team for the transition of patients to outpatient drug recovery services.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Success of this intervention is measured in the amount of patients receive this intervention and subsequently follow up in MAT clinic.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): This program was initiated in May 2018 with the study period consisting of May 2018 to November 2018. There were 24 patients who received buprenorphine after meeting applicable clinical criteria. As a result of this initiative, there was a median of 2.5 patients per month who received buprenorphine. The Addiction Medicine team and ED providers ordered buprenorphine with similar frequency. During this time, 12 out of 24 patients were referred to the Addiction Medicine team's MAT clinic. Seven of these patients were seen at the MAT clinic and three remain active. An additional three patients were seen at external MAT clinics and 6 out of the 24 patients were referred to a drug and alcohol treatment center. Twelve patients had repeated ER visits, half of which were opioid related.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This program shows the potential importance of initiating buprenorphine to patients with opioid use disorder while in the emergency room. While this was a small sample, a substantial amount of patients followed up with a MAT clinic or were connected to a drug and alcohol treatment center. By intervening with patients who have opioid use disorder while they are engaged in a healthcare setting such as the ED, buprenorphine can be initiated within the appropriate timeframe and patients can be transitioned to continued care in the outpatient setting. Collaborative efforts such as this between the emergency department and experts in addiction medicine may help facilitate the care of patients with opioid use disorder.

ON THE FRONTLINES OF THE SILENT EPIDEMIC: FINDINGS FROM A MULTIYEAR PROGRAM TO EXTEND COMMUNITY-BASED HEPATITIS C SCREENING AND TREATMENT IN LOS ANGELES'S SKID ROW

Trista M. Benitez; Shannon Fernando. Los Angeles Christian Health Centers, Los Angeles, CA. (Control ID #3184368)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): An inequitable prevalence of hepatitis C (HCV) exists within Los Angeles's Skid Row, yet screening, linkage, and treatment uptake remains marginal.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Project HEAL (Hepatitis C Engagement and Accessible Linkage) will reduce inequities in HCV screening and treatment through the following objectives: 1) The proportion of screened HCV+ participants who are linked to care, i.e. return for an evaluation to discuss lab results and receive initial HCV care, will increase 13% from 76% to 86%

2) Organizational capacity to cure hepatitis C will be expanded through training of four new HCV treaters, primary care providers who prescribe direct acting antivirals (DAAs) 3) Treatment outcomes of homeless participants on DAAs will be similar to those observed in traditional cohort studies

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): An estimated quarter of Los Angeles's Skid Row population is HCV+, though many are unaware of their diagnosis or how to access treatment. Project HEAL addressed this inequity through routine HCV screening at two sites directly serving Skid Row—an FQHC and a clinic co-located in a shelter. Project HEAL employed a care coordination model to accomplish its primary objective of enhancing linkage to care. A dedicated care coordinator received alerts of all HCV+ antibody cases in real-time via EMR integration with an internal database. This allowed the care coordinator to track and engage HCV+ patients via phone and in-person at their visits. The care coordinator served as an advocate by appealing health plan denials, pursuing treatment for the uninsured, and ensuring timeliness of medication delivery.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Project HEAL measured its progress by the number of HCV tests conducted, unique HCV+ patients identified through testing, and the proportion who were linked to care. Project HEAL monitored each participant's progress in the HCV care cascade, notably those who commenced treatment, completed therapy, and achieved sustained virologic response at 12-weeks post-treatment (SVR-12).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): From 10/2016 to 11/2018, 6,760 HCV antibody tests were performed and a total of 408 HCV+ patients were confirmed. The proportion of linked participants increased 13% from 76% (187/246) in year one to 86% (140/162) in year two. From 3/2017 to 7/2018, 28 HCV+ participants had commenced treatment with DAAs, 79% of which experienced homelessness (22/28). At time of analysis, the treatment completion rate of participants experiencing homelessness was 95% (21/22), 86% had obtained SVR-12 (18/21) with three participants lost to follow-up.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): - Co-location of screening and linkage to care in nontraditional settings, such as homeless shelters, is essential to confront inequities in HCV screening and treatment. - EMR integration and real-time alert of HCV+ cases enhances prompt outreach and successful linkage to care - Care coordination facilitates progress through the HCV care cascade by building trust and rapport with participants - A primary care program with an established HCV Champion can mobilize organizational capacity to treat HCV

ONLINE ASSESSMENTS OF MEDICATION ADHERENCE AND RISKS FOR INADEQUATE ADHERENCE TO CRITICAL MEDICATIONS IN AMBULATORY POPULATIONS

Marina Arvanitis¹; Amy Moore¹; Scott Hur¹; Laura M. Curtis¹; Daniela Ladner²; Michael S. Wolf⁴. ¹Northwestern University, Chicago, IL; ²Northwestern University, Chicago, IL. (Control ID #3186400)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Among patients receiving critical medication regimens, such as transplant recipients, there is a high rate of inadequate medication adherence, yet few strategies exist for assessing and addressing risk for inadequate adherence.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Leverage existing clinic technology and resources to routinely assess patients' adherence to critical medication regimens, and risk factors of inadequate adherence 2. Create clinic workflows to utilize survey data and intervene in real-time, in order to prevent complications related to inadequate adherence

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): In two academic transplant clinics, we have implemented a medication adherence monitoring strategy - TAKE IT - which includes 1) routine, online self-reported assessments of patient adherence to medications and suspected psychological and social comorbidities that affect medication adherence; 2) direct alert notifications of the results via the electronic health record to transplant nurses; 3) quarterly adherence reports to monitor immunosuppression drug levels and summarize adherence trends; 4) deployment of adherence support tools tailored to specific adherence concerns. The online, self-reported 21-item assessment is comprised of novel questions specific to transplant patients, and the following: the Basel Assessment of Adherence - Immunosuppression Scale (BAASIS), the 2-item Patient Health Questionnaire (PHQ-2), the 4-item Consumer Health Activation Index (CHAI), the Woloshin et al. scale of Perceived Adequacy of Tangible Social Support, and the cost-item of the ASK-12 Adherence Barrier Survey. This assessment is completed completely online via a secure patient portal, and takes under 5 minutes to complete.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Completion of the online, self-report assessment 2. Identification of risk for inadequate adherence 3. Response by clinic staff to assessment results

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Among 61 patients randomized to receive the TAKE IT intervention, 75% completed the initial online self-report adherence assessment. Over the first three months, 74% of participants completed at least two assessments. In all, 51% were considered at risk of inadequate adherence. Among all identified adherence concerns, 31% were classified as cognitive (e.g. forgetfulness), 25% psychological (e.g. depression), 17% medical, 4% regimen-related (e.g. side effects), 15% social, and 8% economic. In nearly all patients with reported concerns, transplant center staff responded and resolved the issue. **KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?):** Assessments of medication adherence and potential root causes of inadequate adherence, including psychological and social comorbidities, can be addressed via brief, routine online survey via a patient portal. Such regular assessments have the potential to identify problems or potential problems with adherence between clinic visits, and before adverse health outcomes develop. Future work will focus on deploying adherence support tools tailored to specific adherence barriers, and determining how to integrate these tools into existing clinic workflows without burdening clinical staff.

OUTCOMES OF A MOBILE-BASED BEHAVIORAL ECONOMIC INTERVENTION TO IMPROVE ADHERENCE AMONG HIGH-NEED, HIGH-COST PATIENTS

Maria Duenas¹; Sire Sow²; Yixuan Ma⁴; Mike Fuccillo⁴; Ania Wajnberg³. ¹Mount Sinai Hospital, New York, NY; ²Mount Sinai, New York, NY; ³Icahn School of Medicine at Mount Sinai, New York, NY; ⁴Wellth, New York, NY. (Control ID #3185826)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): High-need, high-cost patients suffer from multiple chronic medical conditions and struggle to adhere to medications and engage in self-management behaviors. Effective tools and strategies are needed to engage and activate this patient population.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Improve adherence to medication and self-management behaviors Improve glycemic control in diabetic patients Achieve high patient satisfaction rates

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Wellth is a New York-based digital health company that has developed a mobile application rooted in behavioral economic principles to help patients with chronic conditions improve their adherence to medication and self-management behaviors. Wellth's app prompts patients with daily reminders and financial incentives to motivate long-term habit formation through daily reinforcement. Patients use the app to upload photos to track their adherence to required behaviors. For this program, \$75 in rewards was offered in increments of \$15 paid out every two weeks as long as patients were fully adherent. For missed tasks, a deduction of up to \$2 was made. The patients participating in this pilot are part of the PEAK Health Clinic at Mount Sinai Hospital, an outpatient clinic that offers intensive primary care services and complex care management to a high-need, high-cost, multimorbid, mixed Medicaid/Medicare patient population. Patients with suspected or known nonadherence were referred for enrollment by their primary care provider. Patients were ineligible if their device was incompatible with the Wellth software. Providers received weekly reports summarizing adherence rates and glucose and weight measurements. Hypo or hyperglycemia, significant weight gain, or sustained nonadherence triggered alerts to the patient's care team.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Percent adherence to medication, glucose-monitoring and weight check-in. Change in A1c pre and post intervention in diabetic patients. Change in weight pre and post intervention in CHF patients. Patient satisfaction with the intervention.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We successfully enrolled 56 patients, overall they demonstrated 84% adherence to medications, 87% adherence to glucose-monitoring and 95% adherence to daily weight check-ins. Among patients with Type 1 or Type 2 Diabetes, there was an average decrease in hemoglobin A1c of 0.5%. Patients enrolled in Wellth for weight check-ins due to a history of congestive heart failure demonstrated an average decrease in weight of 3.7lbs. Patient surveys have revealed a net promoter score of 94%, indicating a high level of patient satisfaction with Wellth.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): High-need, high-cost patients with multiple chronic medical conditions and suboptimal adherence can be engaged to improve adherence to medication and self-management behaviors through the use of a mobile-based intervention that incentivizes patients using behavioral economic principles. Adherence rates were above 80% for all three target behaviors, indicating a high success rate among a generally difficult to engage patient population.

PA-HOSPITALIST TASK FORCE: USING APPRECIATIVE INQUIRY TO DRIVE POSITIVE CHANGE WITHIN A HOSPITAL MEDICINE GROUP

Sydney Katz¹; Alice Tang¹; Rachel Aubuchon²; Vanessa Oliveira²; Stephanie J. Tang¹. ¹Weill Cornell Medical College, New York, NY; ²New York Presbyterian, New York, NY. (Control ID #3167531)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Burnout and provider attrition is pervasive in hospital medicine and negatively impacts physicians (MDs), physician assistants (PAs), and patient care. **OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES):** A collaborative working group, the "PA-Hospitalist Task Force," was created to formulate strategies to: 1. Provide excellent patient care 2. Improve hospitalist and PA job satisfaction and retention 3. Improve hospitalist and PA professional development

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A PA-Hospitalist Task Force comprised of three PAs and three hospitalist physicians was created at an affiliate hospital of a major urban academic center. The Task Force used an appreciative inquiry (AI) approach, through surveys and focus groups, to elicit the strengths of the group and harness them to achieve shared goals (defined above). To discover the best of "what is," MDs and PAs were prompted to reflect upon the strengths and behaviors of colleagues in an open-ended survey. To dream "what could be," participants were asked in focus groups to envision their ideal work environment. To design "what should be," Task Force members analyzed survey responses and focus group field notes for themes that were used to develop a set of Best Practice Guidelines. To "create what will be," guidelines were distributed to the group for implementation and a series of skills development workshops ensured successful implementation of best practices.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Qualitative data was collected via two surveys that evaluated the impact of the program on patient care, job satisfaction and professional development, motivation and meaning in work, and decision to continue employment at the institution.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A survey was sent out six months after the Best Practice Guidelines were disseminated. 17 MDs (74%) and 11 PAs (55%) responded. Participants noted that the new standardized handoff format improved patient care by facilitating efficient and accurate transitions of care and medication reconciliation. PA-led rounds fostered critical thinking, teaching, and improved communication between providers. PAs noted enhanced professional development through increased autonomy in clinical decision-making and communication with patients and providers. PAs and MDs noted a closer partnership in patient care and increased professional development with role optimization. PAs and MDs found enhanced meaning and motivation in work when surrounded by colleagues who drive positive change. Future areas of study include impact on patient care (HCAHP scores, length of stay), efficiency (PA clock-out times), job satisfaction (length of employment), and professional development (scholarly output).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Appreciative inquiry is a powerful tool that can be used within the healthcare setting to change culture and drive positive change. A collaborative approach can be used to optimize hospital medicine PA and MD clinical care delivery, meaning in work, and professional development, and can be translated to other fields.

PATIENT CARE OUTCOMES FROM A RESIDENT SUBOXONE CLINIC

Melanie Woodward¹; Deepa R. Nandiwada¹; Marc Shalaby²; Benjamin Larson³. ¹University of Pennsylvania, Philadelphia, PA; ²Perelman School of Medicine at the University of Pennsylvania, Philadelphia, PA; ³Main Line Health, Philadelphia, PA. (Control ID #3181600)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Incorporating suboxone treatment into the resident clinic provides unique challenges of frequent handoffs, varying provider input into care decisions, and fragmented continuity in the patient-doctor relationship which may affect patient outcomes.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The intent of the program is to treat opiate use disorder in an educational environment with treatment outcomes equivalent to those of primary care based programs.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The START (Solutions To Addiction Recovery and Treatment) Clinic was embedded in a resident-based practice in late 2017 with four rotating attendings which attend on a 6 week rotation and residents which rotate in 1-2 week rotations. The half day clinic occurs weekly based on referrals from across the healthcare system with the goal of providing primary care and suboxone services. Policies are in place to ensure appropriate prescription and urine drug screen monitoring, address relapses, refer to mental health care, and screen for chronic illnesses. However, there is variation in how these policies are carried out amongst providers which may ultimately affect patient success.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We reviewed patient records of those seen in the START program to assess demographics, types of substance abuse, referral modality, and retention with appropriate urine drug screens. The number of relapses and attention to primary care treatment was secondarily measured. Given the unique nature of embedding the program within a resident clinic, special attention was paid to whether these measures were comparable to non-resident outcomes and whether there was unexpected variation in these parameters as a result of breaks in provider continuity.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In the first 14 months of the program, 39 patients were successfully inducted. 3 failed home inductions and did not return. Of those successfully inducted, 59% remain active in the program with average retention of 21.9 weeks and 35.8% retention at 24 weeks. 41% of patients experienced a relapse with an average of 4 appropriate urine drug screens prior to relapses. Variable responses to relapse included signing recommitment contracts, returning to weekly office visits, requiring mental health treatment, engaging partners/family members in care, and retaining wrappers. 88% of patients had routine HIV, HCV screening with 9 patients referred for initial HCV or HIV treatment. Patients received care from an average of 6 residents and 3 attendings.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The resident-based clinic with referral from a health system presents unique issues created by involvement of multiple providers which may lead to decreased rates of retention when compared to other primary care based programs that refer from within their own practice. However, the resident-embedded model has the capacity to increase the number of patients served by suboxone exponentially, caring for

patients immediately and training waivered providers of the future. It will continue to grow in success with time and experience and should be considered for expansion to other residency programs.¹

PATIENT EXPERIENCE AND CULTURALLY COMPETENT CARE FROM THE PERSPECTIVE OF AFRICAN AMERICANS/BLACKS IN DENVER, COLORADO

Beza Jobira^{1, 3}; Terri Richardson³; Virginia Visconti²; Cerise Hunt^{2, 3}. ¹University of Colorado Denver, Denver, CO; ²Colorado School of Public Health, Denver, CO; ³Colorado Black Health Collaborative, Denver, CO. (Control ID #3164479)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): African Americans/Blacks (Blacks) have higher rates of morbidity and mortality than other races and ethnicities, and a lack of culturally competent healthcare hinders effective healthcare delivery and increases the likelihood of poor clinical outcomes

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Assess Black patients' experience of culturally competent care in outpatient primary care through facilitated focus group discussions 2) Conduct qualitative analysis of themes related to cultural competency 3) Disseminate patients' experience and perception of culturally competent care to healthcare providers

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): This study used focus groups to understand patient experiences and perceptions of healthcare providers' cultural competency. Blacks that receive healthcare from three different primary care clinics settings—HMO, federally qualified health center, and center for uninsured patients—were recruited from the Denver Metropolitan area. A flyer was distributed for participation in community centers and an email outreach was done through a community organization. A total of 28 patients participated in one of the three focus groups.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): All focus groups were facilitated by a trained research assistant using a semi-structured protocol, and were recorded and transcribed verbatim. Framework Analysis was used to analyze and identify convergent themes.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Patient experiences were influenced by the dynamic interaction between the healthcare system, clinic environment, and healthcare providers. At the system level, patient experiences were shaped cost, time spent with providers, and providers' cultural competence training. At the clinic level, location and workforce diversity affect patient experiences. At the healthcare provider level, patients highly value the quality of the patient-provider interaction. This interaction was not only influenced by the providers' quality of engagement, cultural competency and communication skills, but also by the patients' ability to advocate for their healthcare.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Regular diversity and inclusion training can support the enrichment of healthcare staff and providers' cultural competency. Integrating culturally competent care appropriate to patients' cultural backgrounds is imperative in improving patient satisfaction and engagement in healthcare.

PAVING A ROAD TO RECOVERY: THREE-PILLARED APPROACH TO IMPROVING DISCHARGE REFERRAL PARTNERSHIPS FOR PATIENTS WITH SUBSTANCE USE DISORDER AND HOUSING INSTABILITY

Nicholas Iverson; Nancy Choi; James Hardy; Meher Singh; Jermaine Blakley; Sarah Imershein; Catherine Lau. UCSF, San Francisco, CA. (Control ID #3177486)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

In caring for patients with homelessness and substance use disorder (SUD), how can a health system optimize new discharge referral partnerships with community-based organizations (CBO)?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES):

1) Improve provider education of CBO partner services. 2) Improve multidisciplinary team (MDT) workflow and satisfaction around discharge of complex patients to CBO partners. 3) Measure the return on investment (ROI) for a health system paying for extended outpatient services for hospitalized patients with SUD and homelessness.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

We describe three components of a partnership between an urban academic hospital's inpatient medicine service and a discharge referral partner Salvation Army Harbor Light (SAHL), a CBO that provides acute detoxification services and opportunity for long term residential treatment. One component is a needs assessment to examine provider understanding of the CBO, followed by targeted education and visits with former patients. A second component improves direct communication between inpatient providers and CBO managers for safe transition of care and examines social worker (SW) satisfaction around discharges. A final component calculates the value equation for the health system to pay for a patient's stay at SAHL up to 30 days, while analyzing pre- and post- referral ED visits, length of stay, and 30-day readmission rates.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION):

1) Provider knowledge of services at the CBO. 2) SW satisfaction with providers regarding communication during referrals. 3) ROI to the health system by decreased ED visits, LOS, and 30-day readmissions.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Component 1: Provider survey (n=33) demonstrated that 54% of providers were not sure or were incorrect about key features of SAHL, and 67% did not feel confident discussing the benefits of SAHL with their patients. Component 2: SW satisfaction survey (n=3) revealed that having providers talk with patients about the CBO prior to referral often made it more difficult to later discuss disposition with patients and requested a change in workflow. An open line of communication between providers and the CBO was established for complex patients, facilitated by SW discussion with the CBO. Component 3: From July 2017 to July 2018, 101 patients have been discharged to the SAHL. Readmission rates decreased from 38% to 19% and number of inpatient days decreased by 1.9, resulting in a direct cost savings of \$5,400 per patient.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?):

1) Many inpatient providers do not understand the intricacies of CBO partner services to help patients make informed discharge decisions. Education and improvement of discharge workflow for

the entire MDT are key to improving referrals and MDT satisfaction. 2) Safe discharges of more complex patients with homelessness and SUD can be coordinated by leadership establishing a direct line of provider-CBO communication. 3) Calculating value to the health system of investment in outpatient services for inpatients with homelessness and SUD demonstrated that these services can be cost-beneficial and improve patient outcomes.

PEP IT UP: CATALYZING PRACTICE IMPROVEMENT

Anuradha Phadke¹; Jake Mickelsen²; Megan Mahoney³. ¹Stanford University School of Medicine, Palo Alto, CA; ²Stanford Healthcare, Palo Alto, CA; ³Stanford University, Palo Alto, CA. (Control ID #3185190)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

How do we create an environment that supports front line teams' engagement in continuous quality improvement?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES):

1) Support front line individuals and teams in conducting rapid-cycle quality improvement projects 2) Grow improvement capability by educating participants in quality improvement fundamentals 3) Align improvement efforts with division strategic objectives while also addressing front line needs

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

Primary Care Performance Enhancement Program (PC-PEP) is a structured quality improvement program within the primary care division at our academic medical center. Its aim is to provide accountability and support for an individual or small team working in one of 13 academic medical center primary care clinics to perform a quality improvement project. Projects are scoped to be completed in less than 8 weeks. Key elements of program structure are as follows: 1) A project is identified in one of two ways: a) a participant with an improvement idea seeks approval to participate from clinic leadership or b) clinic leadership identifies an area of strategic importance for which they solicit a volunteer to lead a project 2) Participants receive a problem-solving guide and coach to assist them with their project 3) Participants present their projects in progress at a thirty-minute weekly teleconference check-in. Check-ins serve as an opportunity for participants to ask questions and engage in brief teaching about quality improvement 4) At the close of projects, participants submit completed project materials, including benefits capture information, to the program team 5) Program and clinic leadership celebrate participants at a quarterly graduation.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION):

Quantitative measures of program success include: 1) benefits such as annualized time savings, financial saving, and care-delivery improvement 2) percentage of primary care staff and faculty engaged in a PC-PEP project 3) enhanced participant comfort with quality improvement as demonstrated by a pre-post survey. Qualitative measures of program success include participant comments on project closing questionnaire documents.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Over the 11 months since this program's inception, PC-PEP has incubated 24 projects across 12 primary care clinics. Over 30 medical assistants and 10 physicians have participated. Project topics have ranged from operations topics such as improving the process of fax management to population health topics such as improving tobacco screening and counseling. Annualized improvements include 6,600 hours in time savings for staff and physicians, approximately \$72,000 in annualized

financial benefits for clinics, and improved care delivery for 8200 patients. Comments from project participants as noted on project closing documents include improved understanding of quality improvement approaches as well as enhanced participant self-efficacy at problem solving.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Institutions can catalyze front line problem solving by creating a structure of supportive leadership, trained coaches, and regular check-ins.

PICC-ING AWAY THE WASTE: A MULTIDISCIPLINARY APPROACH TO VASCULAR ACCESS IN PATIENTS WITH CHRONIC KIDNEY DISEASE

June Kampangkaew; Nathan C. Nowalk; Maulin Shah; Charlie Lan. Baylor College of Medicine, Houston, TX. (Control ID #3186219)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

At the Michael E DeBakey VA Medical Center, the current process for obtaining renal approval for placement of Peripherally Inserted Central Catheters (PICCs) in patients with Chronic Kidney Disease (CKD) 3-5 is complicated by work task redundancy and delays in PICC placement.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To review PICC approval patterns in patients with CKD 3-5 at MEDVAMC To reduce redundant work in the current PICC approval process to improve provider experience To reduce delays in PICC placement in patients with CKD 3-5

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Michigan Appropriateness Guide for Intravenous Catheters (MAGIC) was developed in response to the increasing use of peripherally inserted central catheters (PICCs) to help physicians choose the appropriate catheter for the indication. In June 2017, the Michael E Debakey Veteran Affairs Medical Center (MEDVAMC) implemented MAGIC through a new vascular access team (VAT). The responsibilities of VAT include teaching nursing staff proper PICC maintenance and independently determining the appropriateness of type of catheter placed when consulted for access. This latter role ultimately reduced the number of PICCs placed. In patients with Chronic Kidney Disease (CKD) 3-5 who may be a candidate for dialysis in the future, there is particular concern that PICCs can damage large veins and thus make them unusable for dialysis access in the future. At the MEDVAMC, before a PICC line can be placed for all patients with CKD 3-5, the current process requires: an order for PICC, VAT confirming appropriate indication, and renal consultation for documented approval in electronic medical record. We used a multidisciplinary team approach (renal, medicine, VAT) to evaluate the current process using quality improvement (QI) tools to improve work flow, reduce redundancy, and to decrease time to PICC placement.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Number of hours to place PICC Number of tasks required by team requesting PICC Surveys assessing provider burnout

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Between September 2017 and October 2018, MEDVAMC cared for 23 patients who had an indication for PICC with CKD 3-5. Seventy-eight percent (n=18) were age > 65 years old. Indications for PICC included 57.5% (n=13) for vasopressors or inotropes, 13.0% (n=3) for venous access, 17.4% (n=4) for long-term intravenous (IV) antibiotics,

4.3% (n=1) for chemotherapy. One year all-cause mortality rates were 60.9% (n=14). After consultation with renal, 100% (n=23) of PICCs were approved. To date, no patients from our cohort are undergoing evaluation for dialysis access.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Although there are likely gaps in physician knowledge and practice for PICCs, the VAT has successfully modified requests for PICCs to midline or ultrasound-guided IV catheters. This autonomy has decreased the total number of PICCs placed in all patients, including patients with CKD 3-5. Post-implementation process analyses can identify other areas of potential waste, which can be later reduced by a multi-disciplinary intervention.

PREDICTING RISK OF CLINICAL DETERIORATION: A CLOSER LOOK AT RESIDENT HANDOFFS AND RAPID RESPONSE

Khaled Sanber; Rachael Jacobson; Sarah Tuthill; Bhavika Kaul; Vagish Hemmige; Elizabeth Guy; Chirayu Shah; Stephen B. Greenberg. Baylor College of Medicine, Houston, TX. (Control ID #3187119)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

A key component of the I-PASS handoff includes assigning each patient an illness severity, which is categorized into three groups in order of increasing severity: "stable", "watcher", "unstable" (renamed as "star" in this study). To our knowledge, the utility of these categories as a means of predicting clinical deterioration has not been evaluated.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The main objective of this study was to evaluate whether the illness severity category was predictive of overnight clinical deterioration, defined as a rapid response team (RRT) activation, after resident handoff.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): This study is a retrospective chart review of in-patients at Ben Taub Hospital (Houston, Texas) who were under the care of internal medicine teaching teams during a 12-month period (April 2016 through March 2017). Patients who had an RRT activation between 6PM and 7AM (after resident hand-off and during the care of a cross-covering night team) were analyzed. The data were collected by accessing a previously developed list of rapid response events documented by rapid response nurses. Resident-generated I-PASS Excel handoff sheets and the electronic medical records for all patients with RRTs during the 12-month study period were retrospectively reviewed. Prior to starting residency, BCM residents received training on performing an effective handoff using the I-PASS bundle including patient classification based on perceived clinical stability.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): A total of 5,176 patients met inclusion criteria. For these patients, 28,235 handoffs and 98 RRTs were analyzed. Of the 98 RRTs, 5 (5%) patients were labeled as "star", 35 (36%) as "watcher", and 58 (59%) as "stable". When analyzing all patient handoffs, 377 (1.3%) were categorized as "star", 5,309 (19%) as "watcher", and 22,549 (80%) as "stable". When compared to patients listed as "stable" during handoff, patients listed as "watcher" had an odds ratio of 2.6 (95% CI 1.7-3.9, p < 0.001) and patients listed as star had an odds ratio of 5.2 (95% CI 2.1-13.1, p < 0.001) of an overnight RRT activation. Overall hospital mortality for patients with an RRT was 28%.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A modified I-PASS handoff bundle was effective in predicting which patients on an internal medicine teaching service were at risk of clinical deterioration after patient handoff. This helps the night cross-covering team focus care on high-risk patients who are more likely to require closer monitoring and intervention. We have instituted new interventions, including modifications to the I-PASS handoff bundle, that are aimed at enhancing the ability of residents to identify high-risk patients and improving patient outcomes. This will be followed by another round of data collection and analysis.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A modified I-PASS handoff bundle was effective in predicting which patients on an internal medicine teaching service were at risk of clinical deterioration after patient handoff. This helps the night cross-covering team focus care on high-risk patients who are more likely to require closer monitoring and intervention.

PRESCRIPTION REPORTING WITH IMMEDIATE MEDICATION UTILIZATION MAPPING (PRIMUM) IMPLEMENTATION : DO NO HARM

Animita Saha¹; Rachel B. Seymour². ¹Atrium Health, Charlotte, NC; ²Atrium Health, Charlotte, NC. (Control ID #3175511)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): An important step to reduce the number of people who are associated with prescription medication abuse, misuse and diversion is identification of at risk patients prior to narcotics prescription.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To assess the changes in prescribers' behavior when presented with immediate feedback through an electronic alert system based on searchable objective data on EMR on potential misuse of prescription narcotics in acute and chronic pain patients.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The study was conducted at Atrium Health, Charlotte, NC. We used PRIMUM, which is a computerized alert system to identify patients at high risk for misuse, abuse, and diversion of prescription narcotics and to provide critical information to the prescriber at the point of care to help clinical decision making. Evidence-based triggers were built into EMR to fire within when a prescription for a narcotic was initiated. The following indications prompted the alert to the prescriber: 1. Current prescription of a narcotic with >50% remaining expected; 2. 2+ visits to ED or Urgent Care with onsite treatment for narcotics (excluded visits led to admission) within past 30 days; 3. 3+ prescriptions for narcotics within past 30 days and 4. Previous presentation for overdose; 5. Positive screen for alcohol, cocaine and marijuana

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Baseline data were collected for one month by running the alert algorithm silently (no alert) followed by five months of live data when the prescribers received the alerts. Following outcomes were measured: 1. Number of alerts; 2. Number of cancellations of narcotic prescriptions following alert; and 3. Overrides of the alert system.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): During the test period, our system had 5,133,278 encounters. For opioid (n=282,870), the alert was triggered in 71,498 (25.3%) cases, of which 13.7% were temporarily cancelled, however,

ultimately 5.4% (n=3,860) were resulted in no prescription. For BZD (n=96,999), the alert fired in 21,810 (22.5%) cases, of which 23.4% were initially cancelled (n=5,104) and 13.1% resulted in no prescription (n=2,857). Altogether, cancellations resulted a reduction of 6,717 prescriptions. Rates of cancellation and no prescription significantly differed by specialty ($p<0.0001$). Cancellation for opioid prescription was most when patients received more than 3 prescriptions over last 30 days ($p<0.0001$) and for BZD, it was early refill request ($p<0.0001$).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The PRIMUM-generated alert system presented an opportunity to utilize EMR to provide targeted clinical-decision support for appropriate prescribing. This platform laid the groundwork for further clinical decision support, which included evidence-based guidelines for acute and chronic pain management, including risk assessment prior to prescribing and providing a streamlined method to drug monitoring programs. There was a high rate of cancellation still a huge number of patients with risk factors received a prescription. Although these may have been clinically indicated this system presents an opportunity to train providers as many alerts were ignored.

PRIMARY CARE & COMMUNITY HEALTH WORKER BASED QUALITY IMPROVEMENT PROGRAM IMPROVES HYPERTENSION OUTCOMES IN URBAN INDIAN SLUMS

Turja Chakrabarti¹; Debolina Pramanik²; Arpan Pramanik²; Karthik Manina³; Sourav Mondal³; Paul O'Rourke⁴. ¹John Hopkins University School of Medicine, Baltimore, MD; ²Medical College Kolkata, Kolkata, India; ³Pratit International, Kolkata, India; ⁴Johns Hopkins University, Baltimore, MD. (Control ID #3185843)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Hypertension management is especially challenging in the context of extreme poverty found in Urban Indian Slums.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The purpose of this Quality Improvement (QI) program serves to build a multidisciplinary effort to manage hypertension in multiple slum communities. The program aims to combine evidence-based pharmacotherapy with counselling on lifestyle modifications to bring patients living in extreme poverty to meet the American College of Cardiology (ACC) defined blood pressure goal < 130/80 mmHg.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A mobile health clinic that provides routine primary care in three underserved slum areas in Kolkata, India was selected for a QI program for hypertension management. The population of these slum communities live in extreme poverty with an average per capita daily income of \$1.05 US. A team comprised of 2 Primary Care Physicians (PCP) and 5 Community Health Workers (CHW) participated in this QI program which involved 59 patients. PCPs and CHWs underwent a workshop on hypertension guidelines and specialized counseling for patients with hypertension. PCPs treated hypertension in clinic with 4 available drug classes (Thiazide diuretics, ACE Inhibitors, ARBs and CCBs) while also providing initial guidance and counseling on lifestyle modifications. Patients were routinely followed up in clinic at 1 to 2 month intervals. CHWs visited hypertensive patients in their homes on a weekly basis to measure blood pressure, teach medication management and counsel on dietary and lifestyle modification. CHWs also reported back to the PCP from the patient's home on abnormal blood

pressure readings, and if deemed necessary, medication changes were made in real time prior to clinic visits.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Key outcome measures being studied include changes in blood pressure, changes in weight, adherence to medications, adoption of a low sodium diet (<2g/day), cardiovascular exercise (>30 mins/day), tobacco use status, and alcohol use status. A checklist survey is completed by CHWs at each home visit recording these outcomes.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 59 patients with blood pressures > 130/80 were selected to be part of this quality improvement program. Average age of participants was 52.6 years (min = 19, median= 42.5 max= 80). The group comprised of 74.6% females and 25.4% males. Average blood pressure on enrollment was SBP = 148.81mmHg and DBP= 84.6 mmHg. At 6 months, average blood pressure was SBP = 126.78 mmHg and DBP = 81.19 mmHg. Mean reduction in systolic blood pressure was 22.03 mmHg. At the end of 6 months, 50.8% of patients within the quality improvement program had blood pressures at ACC goal of <130/80.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): In the context of extreme poverty, this multidisciplinary community based approach led to a mean reduction in SBP of 22.03 mmHg and led to 50.8% of patients to be within the ACC blood pressure goal. These findings should encourage development of similar programs in resource deprived settings globally.

PROMOTING HIGH-VALUE PRACTICE BY STANDARDIZING COMMUNICATION BETWEEN THE HOSPITALIST AND PRIMARY CARE PROVIDER DURING HOSPITALIZATION

Marwa Moussa¹; Carrie Mahowald¹; Charles Okamura¹; Olena ksovreli¹; Myint Aye²; Himali Weerahandi¹. ¹NYU Langone, Staten Island, NY; ²NYU Langone Hospitals- Brooklyn, Brooklyn, NY. (Control ID #3167861)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

The increasing complexity of admitted patients, shorter hospital stays and post-acute care adverse events demand a more sophisticated and effective coordination of care between hospitalists and Primary care providers (PCPs).

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Standardizing communication between Hospitalist and PCP during hospitalization will lower the rate of readmission due to lack of PCP follow up and post-acute care adverse events. 2. Implementing this practice into our daily workflow will improve PCP satisfaction and increase referrals to our institution.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

We reviewed a root-cause survey of 30 day readmissions between 1/2018-4/2018 as well as readmission rates for each of our hospitalists. We surveyed our PCPs' satisfaction with communication experiences with our hospitalist group. Finally, we conducted a semi-structured interview of the hospitalist with the lowest readmission (8% vs 12% average for other hospitalists) and highest PCP satisfaction rates, Dr. A, to develop best practices for closed loop communication. Based on this data, we designed a protocol and piloted on 5/1/2018, where the hospitalist contacts the PCP via phone call on admission and delivers a discharge narrative to the PCP via our EMR's routing capability. We used a trackable smart phrase to document the communication. For the prospective phase, we will operationalize these best

practices in a study group, Family Health Center PCPs. A control group (community PCPs) will receive usual practice.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We will compare readmission rates between the study group and control group, monitoring the proportion and absolute number of readmissions attributed to no PCP follow up or medication errors. Follow up satisfaction surveys will be sent to the PCPs 6 months after our revised communication practice. Finally, we will monitor the hospitalists' compliance with the smart phrase.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A review of our institution's 30 day readmissions between 1/2018-4/2018 found that 19% were attributed to lack of PCP/outpatient provider follow-up. Surveys of our community PCPs showed 70% reported being contacted by the hospitalist group in less than 25% of the time. Results from Dr. A's interview revealed that after her encounter with the patient, she calls the patient's PCP highlighting the admitting diagnosis, significant events, pertinent labs, imaging and medications. Dr. A then delivers a discharge narrative to the PCP on the day of discharge highlighting any medication changes, incidental findings and follow up. On a random audit of 100 charts between 5/1/2018-10/30/2018 our preliminary data show that there was 88% compliance with using the smart phrase by the hospitalists.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Using a "positive deviance" approach, we identified best practices for hospitalist-PCP closed loop communication to develop an intervention to improve this aspect of care. If we are successful in reducing readmission rates and improving PCP satisfaction, we will expand to all of our PCPs and ultimately expand to other services to implement this program as best practice.

PROTON PUMP INHIBITOR STEWARDSHIP: DEPRESCIBING PROTON PUMP INHIBITORS IN A PRIMARY CARE CLINIC

Cecilia Y. Cai¹; Chiemeziem Eke¹; Niharika Mallepally¹; David Szafron¹; Andrew S. Brown¹; Derek Lin¹; Jerry Wong²; Erica Lescinskas¹; Lee Lu¹. ¹Baylor College of Medicine, Houston, TX; ²Harris Health System, Houston, TX. (Control ID #3159428)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

The proton pump inhibitors (PPIs) are commonly used for treatment of upper gastrointestinal disorders; however, the rise in PPI prescriptions has led to increased prevalence of adverse drug effects and increased cost of therapy.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Identify rate of inappropriate PPI prescriptions at a resident-run primary care clinic. 2. Implement a PPI taper order set. 3. Educate residents on appropriate indications for PPI and reduce the rate of inappropriate PPI prescriptions.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

We conducted an observational chart review of PPI prescriptions over a 14-month period from January 2017 to August 2018 at an Internal Medicine resident-run primary care clinic. Medical records of 315 patients prescribed PPIs were reviewed for specific indications and duration of therapy. Intervention entailed implementation of a four-week PPI taper order set to the clinic electronic health record, in addition to provider education through flyers and emails that highlighted PPI indications and consequences of long-

term use. During analysis of prescribed PPIs, usage was categorized as appropriate or inappropriate based on criteria set by Gastroenterology clinical guidelines.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We analyzed the number of PPI prescriptions per month, indications for prescriptions, and the rate of inappropriate prescriptions per month.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 70 patient charts were analyzed over six months pre-intervention, and 245 charts were analyzed over eight months post-intervention. Monthly number of prescriptions fluctuated; however, the rate of inappropriate PPI prescriptions has steadily declined since beginning of intervention. Pre-intervention, a substantial number of PPIs were inappropriately prescribed (77%). Of these prescriptions, a majority (67%) was for gastroesophageal reflux disease (GERD), followed by nonsteroidal anti-inflammatory drug (NSAID) use (9%), and unspecified dyspepsia (7%). The most common mistake in GERD and dyspepsia prescriptions was providing a several month supply and refills without close interval follow-up to assess treatment efficacy. Preexisting NSAID use as documented reason for PPI prescription for ulcer prophylaxis was commonly inappropriate due to young patient age with low bleeding risk. Post-intervention, inappropriate PPI prescriptions decreased to 53%, of which 61% was attributed to GERD, 5% to NSAID use, and 8% to dyspepsia.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Many resident physicians lack adequate knowledge on indications for long-term PPI use and unintentionally over-prescribe. With a structured deprescribing tool and enhanced awareness, residents were able to reduce inappropriate prescriptions significantly. Primary care providers can use a similar intervention at their practice to reduce unnecessary PPI prescriptions.

PROVIDER BARRIERS TO LINKING PATIENTS WITH COMMUNITY HEALTH COACHES AT AN URBAN CLINIC

Kun Chen¹; Tamara Goldberg². ¹Mt Sinai St Luke's/West, New York, NY;
²Mount Sinai St. Lukes West, New York, NY. (Control ID #3185823)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Though clinical-community partnerships have increasingly emerged to address social determinant barriers for patients, best practices to engage providers and patients with such services are not well studied.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To understand provider-perceived barriers in engaging patients with community health coach services. To increase referrals to community health coaching services.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

The Ryan Adair Community Health Center is a Federally Qualified Health Center (FQHC) in Manhattan that serves as a training site for our internal medicine residents who rotate through the clinic in quartiles every two weeks. The center recently partnered with a local community-based organization (CBO) which provides free community health coaching services to patients with common chronic conditions. A resident physician-champion was selected to spend time with the CBO and focus on ways to create awareness of this service among resident providers. To increase referrals, the physician-champion disseminated information about the CBO services and

referral instructions via email reminders, postings in exam rooms, and intermittent verbal announcements during pre-clinic huddles. We then tracked referrals to the CBO over a six month period and surveyed residents about their awareness of the services offered and referral process.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The number of referrals generated by providers to the community-based organization was tracked over a six month period. Provider-perceived barriers were assessed via survey administration.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Over the course of a six-month period, five referrals were generated from our clinic to the CBO. 69% (22 out of 32) of resident providers completed the survey. 45% of respondents (n=10) were unaware of the CBO and services offered, 55% (n=12) did not know the criteria for a referral, and 25% (n=5) reported making referrals to the CBO. Providers noted that the most common reasons for patient refusal of services when offered was patient preference to try to manage their disease on their own and perceived time commitment.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The data above highlights that provider unawareness is a key barrier in connecting patients to community-based resources. Neither email reminders nor postings in clinic were high-yield contributors in generating referrals, as evidenced by the number of resident providers who were either unaware of the CBO or did not know the criteria for a referral. Key next steps include engaging other members of the clinic team in advocating for the CBO within the daily work flow, ensuring consistency of daily reminders at all huddles, and addressing reasons for patient refusal when a referral is offered.

QUALITY IMPROVEMENT IN HOSPITAL AT HOME: AN INTERDISCIPLINARY AND RAPID IMPROVEMENT APPROACH FOR A NOVEL MODEL OF CARE

Pamela Saenger; Claire Davenport; Elisse Catalan; Sara Lubetsky; Diana Motti; Katherine Ornstein; Linda DeCherrie. Icahn School of Medicine at Mount Sinai, New York, NY. (Control ID #3185411)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

In implementing an innovative home-based care model, Hospitalization at Home (HaH) programs face the dual challenge of ensuring high quality patient care as well as seamless coordination within the interdisciplinary team and with contracted service vendors (CSVs), who perform integral functions.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Develop an intuitive adverse event and incident reporting tool 2. Engage interdisciplinary team members in identifying and addressing key systems issues 3. Track our progress and report findings

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

HaH provides hospital-level care to patients in their homes. Our team provides care alongside CSVs who assist with nursing, labs, imaging, durable medical equipment, medication and oxygen delivery, and patient transportation. After discharging patients from the acute hospital episode, we follow them clinically for a short "plus" period. We developed a customized Web-based Incident Reporting System (WIRS) for the team to report both

adverse clinical events as well as communication lapses, barriers to efficiency, and deviations from protocols. A Quality Improvement (QI) team member reviewed each incident report (IR), put an action plan in motion, and then reviewed it during a weekly QI workgroup; action plans included one or more of the following: plan-do-study-act (PDSA) cycle, team huddle, case review, Root Cause Analysis (RCA), or change in protocol. Summaries and longitudinal trends were presented to the larger team monthly.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): All team members were oriented to the goals of incident reporting, the culture of non-blame, and trained how to access and submit a report. The QI workgroup met weekly to review new IRs and new or previously developed action plans. We presented qualitative and quantitative summaries of our work monthly to the larger team.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 194 IRs were submitted between 9/2015 and 12/2018. IRs per HaH episode increased 10-fold after we switched from email or hard copy reports to a web-based platform (2.42 vs 0.23). While MDs submitted the largest share (49%), 20% were submitted by NPs or RNs, and 17% were submitted by other staff. 27% of events occurred during the "plus" period. IRs were most often related to CSV or communication issues (37% and 26%, respectively). Clinical events (e.g. falls) were less common (5.7%). Despite an increased patient census, IRs related to communication lapses, DME delivery, patient transportation, and infusions declined from July to December 2018.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our WIRS is the cornerstone of our program QI, allowing our team to investigate adverse clinical outcomes and CSV issues alike, identify underlying systems issues, and act quickly to address them. Other HaH programs and any care model that leverages CSV services may benefit from implementing a customized WIRS with near real time reviews by a core QI team who are empowered to rapidly implement changes. Interdisciplinary collaboration and regular reporting to stakeholders solidify buy-in and continued participation.

RAMP (REAL TIME ANALYTICS MONITORING PLATFORM): USING AND DISPLAYING PREDICTIVE MODELING AND CARE COORDINATION FOR PATIENT CARE MANAGEMENT

William R. Clay; John Voss; John E. Ainsworth; Joel M. Schectman; Marissa McKay; Andrew Barros; Megan Pierce; Valentina Baljak. University of Virginia, Charlottesville, VA. (Control ID #3180640)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): There is a broad need to improve the efficiency of patient evaluation, acuity status assessment and care resource allocation in the inpatient setting.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Provide physicians and nurses with new real-time patient care decision-making tools 2. Overcome inherent EMR limitations for developing, testing, and deploying complex predictive models

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

The Real-time Analytics and Modeling Platform (RAMP) was developed as a tool for aggregating and displaying trends in real-time inpatient acuity and for deploying complex predictive models. RAMP extracts current patient information from the electronic medical record (EMR) and physiologic monitoring interfaces, uses this information as inputs to predictive models, and

displays the information to a monitor or mobile device organized by patient care team, unit or floor. The system is not restricted by model type, quantity, or complexity. Data visualization can be built into RAMP and/or RAMP can write data back to the EMR. Our current implementation of RAMP displays a map of a floor or unit with colored patient icons representing patient status. When patients of interest are scattered across geographic units, patient scores and icons can be viewed in list format. Individual patients can be selected by mouse click or touch screen to show current patient data and 48 hour trends.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): RAMP value will be measured by reduced mortality, reduced length of stay, and the count of new patient interventions including new antibiotics, fluid boluses, imaging orders, nursing staff changes or ICU transfer. Additional benefits to be measured include improved care team efficiency and communication and fewer 'false-alarm' rapid response alerts.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A pilot test is underway on a 27 bed medical nursing unit using a 40" wall mounted monitor at the center of the unit passively displaying the NEWS (National Early Warning System) score for all unit patients. Nurses alert MDs when they identify 1) nursing concern re: illness course or 2) a NEWS score that meets or exceeds the designated acuity threshold. In the first month of a planned 6 month trial, 50% of the alerts (12 of 24) have been triggered by a high RAMP NEWS score with an overall fire rate of 0.77 alerts/day. There was also a 31% increase in patient interventions (new antibiotics, imaging or fluids) attributable to high RAMP NEWS triggers. The small sample precludes formal statistical testing of the outcomes identified as measures of success, but it is clear to date that the system is influencing care team behavior. Testing of active alerting is also planned.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Unit-based standard work supported by passive display of early warning scores may improve delivery of patient care. Input from clinicians and analytics staff is essential for successful development of such a software tool. Predictive models and the interventions that utilize them require input and buy-in from the end-users in order to change the complex processes associated with hospital standard work.

RESIDENT LED INITIATIVE TO IMPROVE SCREENING FOR SOCIAL DETERMINANTS OF HEALTH IN AN OUTPATIENT CLINIC

Robert J. DeGrazia¹; Nicole Laslett¹; Ronak Patel¹; Anthony Tramontozzi¹; Zehra Hussain². ¹Christiana Care Health System, Aberdeen, MD; ²Christiana Care, Chadds Ford, PA. (Control ID #3153502)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): There is no standarized approach to screening for SDoh in our resident outpatient clinic

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Our quality improvement initiative aimed to develop a standarized approach to screen patients for SDoh in the primary care setting, create a streamlined referral system for patient resources and to quantify the degree to which these factors affect our clinic population.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Wilmington Adult Medicine clinic at Christiana Care Health System in Wilmington, DE serves an underserved population. To address the lack of standarized

screening for SDoH, we developed a questionnaire based on a validated survey guidelines. This was developed into a EMR "quicktext" that could be used to screen patients. The first PDSA cycle residents implemented this questionnaire into their workflow. The second PDSA cycle involved front desk staff screening patients at check-in. The third cycle shifted to medical assistants screening patients.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Measures of success included the number of patients screened and user acceptability to workflow.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Baseline data was obtained through chart review. ~10% of each resident's patients were manually reviewed for documented SDoH. Out of ~100 charts reviewed, 33 included at least one documented SDoH and none had any systematic screening performed. In the first PDSA cycle, 86 patients were screened using the quicktext. Of those screened, 25 (29%) screened positive for at least 1 SDoH. This led to 13 new referrals to social work. 1 month after initiation, residents were surveyed and revealed that none continued to use the quicktext after implementation. We next worked with clinic staff to have the front desk screen patients, however 2 weeks into this cycle, only 1 patient had been screened with the major barrier being "time constraints." For our next cycle, we attempted to have medical assistants(MA's) screen patients during the rooming process. After 2 weeks, 33 patients were screened. MA's also cited "lack of time" and "disruption of workflow" as the primary barriers to screening all patients.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Among several barriers faced while working on this initiative, the most significant was our office changing EMRs part way through our initiative, and we were unable to track our data in the EMR, instead having to track the number of patients screened manually. Despite this, we gathered useful information to help inform next steps, including factors that influence whether residents and office staff are able to integrate screening into their workflows. We learned that fine-tuning the workflow in our office on a small scale was extremely valuable prior broader implementation. Next, we will work on integrating the screening questionnaire directly into our new EMR to address barriers. Lastly, despite these barriers, we still screened 120 patients and identified significant unmet needs in our patient population. We learned that this screening strategy is not only valuable for patients, but also, creates valuable data on the needs of the population to be used to allocate resources.

RESOURCE INTENSIVE CARE TRANSITIONS PROGRAM IMPACT ON 90-DAY HOSPITAL READMISSIONS

Shreya P. Trivedi¹; Emma Trawick¹; Jillian Diuguid-Gerber²; Ian Fagan¹; Mack Lipkin³; Mark D. Schwartz¹. ¹NYU School of Medicine, New York, NY; ²New York University, New York, NY; ³New York University School of Medicine, New York, NY. (Control ID #3179204)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Is enrollment in a Care Transitions Program (CTP) associated with decrease in 90-day hospital admissions compared to standard discharge care for high utilizers in a large safety-net city hospital?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Implement a team to follow high-utilizers for 30 days post-discharge; 2. Assess patient needs with a home visit or other face-to-face visit and coordinate care based on needs, and 3. Decrease hospital admissions of high utilizers

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): In a large safety-net hospital, high utilizers were Medicaid-insured or uninsured patients who had four or more admissions in the prior year. Inpatient medical teams made referrals to CTP. In CTP, a multidisciplinary team of a social worker, nurse, community liaison and, at times, a medicine resident followed the patient for 30 days post-discharge. Interventions included medication reconciliation, weekly phone calls, and either a home visit or face-to-face visit at a preferred location for the patient. Eligible high utilizers not referred to CTP received standard discharge follow-up and served as controls in this quasi-experimental study.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We identified all admissions of high-utilizers eligible for CTP enrollment between 4/1/17 and 9/30/17. Patients were categorized as enrolled in CTP, with or without a home or face-to-face visit, or not enrolled in CTP. Changes in 90-day admission rates before and after the eligible admission were compared in the CTP and control groups, with the eligible admission included in the pre-intervention period. Subgroup comparisons were also performed. The decrease in 90-day admission rates across groups were compared using ANOVA.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Of the 358 admissions of eligible high-utilizers, 31% (112) were enrolled in CTP. Of those in CTP, 54% had either a home visit (28) or a face-to-face visit (32). Within control patients, 90-day admission rates fell from 2.90 to 1.26, a decrease of 50.6% (95% CI 39.0%-62.3%). Within CTP patients, admission rates fell from 2.53 to 1.02, a decrease of 54.6% (95% CI 41.0%-67.6%). The difference in 90-day admission reductions between CTP and control groups, 3.7% (95% CI -22.8%-30.2%), was not significant. Per-protocol analysis of the CTP subgroups who had either a home visit or a face-to-face visit showed decreases in 90-day admissions of 68.7% (95% CI 51.2%-86.2%) and 64.0% (95% CI 46.9%-81.1%) respectively. The differences in 90-day admission reductions between CTP patients with home or face-to-face visit vs. controls, 18% (95% CI -13%-49%, p=0.59) and 13.3% (95% CI -17.8%-44.5%, p=0.84) respectively, were not significant.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The trend towards greater decrease in 90-day admissions for high utilizers that had a home or face-to-face visit suggests that assessing high utilizers in their community environment may improve care for these patients. Given the small sample size and non-randomized allocation, interpretation of the results is preliminary, and subsequent, randomized, adequately powered study with criteria-based high-utilizer referral to these high-intensity resources is warranted.

REVISITING PRIMARY CARE: A QUALITY IMPROVEMENT STUDY

Ben Long; Samuel O. Schumann; Jingwen Zhang. Medical University of South Carolina, Charleston, SC. (Control ID #3184910)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Why do established patients of a practice choose to utilize emergency department (ED) services over ambulatory services?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Assess patient reasoning for utilizing emergency services rather than ambulatory services. 2. Identify future targets for interventions to reduce non-emergent utilization of (ED) services.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): During April 2018, all patients presenting for an office visit at an academic internal medicine clinic were screened at registration for ED visits within the last 30 days. Patients who screened positive were asked to complete a survey querying all applicable reasons for ED presentation. Questions were modified from prior published surveys on the reasons for ED presentation. Survey responses were consolidated into groups based on response themes and then linked at the patient level to the ED visit. The majority of prior published work on this subject has occurred in the ED instead of in ambulatory clinics, where clinic resources can be leveraged to keep non-emergent visits out of the ED.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Measures of success include quantifying patient reasons for visiting ED and correlating patient reasons with severity of illness.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 200 surveys were delivered with a response rate of 56%. 73% of patients cited "problem severity" as a reason for seeking care in the ED. 45% of patients contacted their PCP's office prior to seeking care in the ED. 13% could not wait for an answer, 15% could not wait for the appointment, and 27% were sent by their PCP's office or another MD. 19% of patients sought care after hours, 9% perceived the need for testing only available in the ED, and 10% cited superior quality of care in the ED. 2% stated transportation was a barrier to accessing primary care and a reason for ED visit. Of the patients seen in the ED, 30% reported a subsequent hospital admission. Patient responses were then linked to electronic health record data and stratified by the Emergency Severity Index (ESI), in which lower score represents more severe illness. In our respondents, there were no patients with an ESI of 1 or 5. 100% of patients with an ESI of 2 reported severity as a reason for ED visit and 69% of these patients were admitted. 77.3% of patients with an ESI of 3 reported severity as a reason for ED visit and 34% of these patients were admitted. 60% of patients with an ESI of 4 reported severity as a reason for ED visit and 20% of these patients were admitted.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Reducing unnecessary ED visits is on the forefront of utilization and continuity initiatives. Our findings suggest that improving patient education of reasons for ED visits and of resources (testing and treatments) available in ambulatory clinics could reduce the number of ambulatory care sensitive conditions treated in the ED, allowing for cost savings and improved patient satisfaction. Other opportunities such as expansion of telehealth, expansion of case management, and establishment of ambulatory clinics within EDs should be explored.

SERIOUS ILLNESS CONVERSATIONS: HELPING CARE TEAMS TAKE THE LEAP

Deborah Swiderski. Montefiore Medical Center, Bronx, NY. (Control ID #3184183)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Despite robust evidence of the benefits of goals of care conversations with patients who have late-stage chronic illness, and widespread agreement among both patients and physicians that such discussions are beneficial these conversations are usually infrequent, late, and limited.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To train and support care teams in 2 urban

academic health centers to have goals of care conversations with patients in the late stages of chronic illness using the Serious Illness Conversation Guide

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Serious Illness Conversation Guide, a tool developed by Harvard's Ariadne Labs, has shown great promise in helping physicians and care teams to have goals of care conversations with patients in the late stages of chronic illness. Such conversations are typically difficult for both physician and patient and often never take place until the patient is terminally ill and no real choices remain. This project is designed to assess the use of the Guide in academic health centers serving an urban underserved community. In this implementation phase the project was introduced in small group meetings and in larger presentations such as Grand Rounds. Physicians, nurses, and social workers at 2 academic neighborhood health centers were trained in the use of the Guide by project leaders who attended training at Ariadne Labs. A leadership group meets monthly to assess progress and address problems. Site champions have assumed active roles in helping trained providers use the Guide with appropriate patients. Documentation and coding and billing emerged as important issues and are being addressed.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Training began in September 2018. Our goal was to train at least 5 providers at each site over a 3 month period and for each of those providers to have 1 conversation by the end of December.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The implementation phase of this project has been remarkably successful: 15 MDs, 4 RNs, and 4 SWs completed the 2 hour training in the use of the Guide over a 3 month period. Flexible workflows were developed by each site to promote the use of the Guide. 7 providers completed 14 conversations by the end of the 4 months from the beginning of training. A protocol for documentation of these visits in the EMR was established. Working groups were formed at the departmental level to address long term solutions for EMR documentation and coding and billing. Informal feedback from providers has been strongly positive.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Several factors contributed to the success of the project thus far. Project leadership by a physician champion with expertise in the field of provider-patient communication, and modest salary support for the project leader facilitated implementation. Strong support from both administrative and clinical leadership was critical. And it is likely that part of this acceptance stems from the fact that the project addresses physicians' desire to provide personalized, respectful care for their seriously ill patients.

SHARING THE BURDEN OF DISEASE: MULTI-DISCIPLINARY SHARED MEDICAL APPOINTMENTS FOR OSTEOARTHRITIS

Katie Miller¹; Linda Baier³; David Rabago². ¹University of Wisconsin, Madison, WI; ²University of Wisconsin School of Medicine and Public Health, Madison, WI; ³f Medicine and Public Health, Madison, WI. (Control ID #3170064)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Knee and hip osteoarthritis (OA) is a disabling condition affecting over 50% of US adults over 65. Patients often do not receive guideline-recommended care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The University of Wisconsin Knee and Hip Comprehensive Non-Surgical Management Clinic uses shared medical visits

(SMV) with multi-disciplinary providers to manage patients with knee or hip OA. The long-term clinic goals are to decrease the gap between recommended and actual OA care and to improve self-reported and objectively assessed outcomes in these patients.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We recently implemented an innovative SMV program. Patients commit to attending six 90-minute appointments (plus optional 30-minute exercise session) twice monthly for 12 weeks. SMV care is provided by a general internist, physical therapist, dietitian, and health psychologist. During each visit, patients are given an opportunity to share their progress and challenges, learn about managing OA in an interactive format, and set treatment goals.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): At the first and last SMV, we assess: Quality of life: Veterans Rand 12-Item Health Survey (VR-12) physical and mental subscales Objectively-assessed function: Timed Up and Go (TUG) Test, 30 second Chair Stand Test Weight loss Satisfaction, knowledge, and confidence: (0-10 Likert scales).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): From Fall 2017 to Summer 2018, 27 patients (mean age 59.6 ± 8.4 , 25 female) attended an average of 4.6 of the 6 visits. All were obese at baseline; 19 (70.4%) had a BMI over 40 kg/m^2 . Sixteen patients (59.2%) had 5 or more significant co-morbid conditions and the mean VR-12 Physical Health Score was low (26.60 ± 8.35 points). At 30-56 weeks post, 6 (22.2%) patients had a weight loss of 10% or more while 4 (14.8%) lost 5-10% of baseline weight. Changes in the VR-12 were small; the Cohen's d effect size for physical and mental subscales was 0.22 and 0.24 respectively. Improvements were seen for the Chair Stand Test (2.2 rises) and TUG time (5.3 seconds). Patients valued the SMV program and would recommend it to a friend (9.16 ± 0.80 , 10-point scale). They indicated increased confidence in managing osteoarthritis (7.8 ± 1.61 points) and reported a high level of knowledge gained (8.6 ± 1.76 points).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): These early data suggest that SMVs have the potential to improve quality of life and function, and facilitate weight loss, in patients with hip and knee OA. SMVs were well-liked and improved patient knowledge and confidence regarding OA and its management. Additional planned assessments include more formal tracking of SMV-associated changes, comparison to other management strategies, and determination of OA guideline adherence

SMALL STATE, BIG CHANGE: A 5-YEAR DESCRIPTION OF VERMONT'S PRIMARY CARE TRANSFORMATION TO EMBRACE POPULATION HEALTH

Jennifer Gilwee¹; Halle G. Sobel². ¹University of Vermont, Shelburne, VT; ²University of Vermont Medical Center, Burlington, VT. (Control ID #3153492)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): How do you transform the delivery of care across primary care disciplines in an academic medical center to positively affect outcomes for an attributed population?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): - Describe the standardization of care to a population of patients across primary care specialties - Share successful practice of

administrative/leadership coordination among three primary care specialties at our organization. - Summarize positive impacts of the transforming primary care process on patient outcomes

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The University of Vermont Medical Center consists of 12 ambulatory clinics which span three primary care specialties (Internal medicine, Family medicine, Pediatric medicine) and care for ~80,000 empaneled patients. There are ~160,000 visits per year which cover acute care, chronic disease management and preventive healthcare. Five years ago we realized the need to transform our care delivery to efficiently and effectively meet the comprehensive needs of our patients and providers. This led to the implementation of standardized pre-visit protocols, daily huddles and weekly care coordination meetings all designed to optimize the care delivered to patients, ensuring their preventative as well as chronic disease (including chronic opiate use) needs are met. We instituted a specific administrative structure including physician and staff supervisor representatives from each clinic site. The operational deployment and review of protocols was done by multidisciplinary groups (including MDs, RNs, medical assistants and clerical staff) to foster empowerment and adoption.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Over the course of our transformation we have had the implementation of several protocols spanning all aspects of the patient-health system interaction including pre-visit planning, rooming, medication refill, post-hospitalization follow up and specific condition RN-directed treatment protocols. As a result we have demonstrated success in measures that cut across multiple ages and conditions. These include preventive health measures including increased immunization rates and screening for hepatitis C. We demonstrated success in achieving advanced care planning documentation on our population. Most recently, we have demonstrated success in increasing the number of opiate informed consent and prescription agreements on file for those patients who are on chronic opiates.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Over a 3 year span we noted a 4% increase in overall immunization rate for our entire population. Our hepatitis C screening rates went up from 66% to 71 % over a 5 year timeframe. Our advance care planning documentation rates rose from 30% to 39 % over a 1 year timeframe. Our percent of patients with opioid informed consent and prescription agreement has gone up to >85 %

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): -Must have leadership support and administrative champions (MD, supervisors) -Imperative to empower all members of the team to function at the top of their job description -Implementation and adoption can be hard without clear communication of why things are changing. Cannot feel "top down"

STANDARDIZED HANDOFF EDUCATION FOR INTERNAL MEDICINE RESIDENTS: AN INNOVATIVE EDUCATION AND PATIENT SAFETY INITIATIVE

Morgan R. Moore¹; Steven G. McKee². ¹University of Arkansas for Medical Sciences, Little Rock, AR; ²University of Arkansas, Little Rock, AR. (Control ID #3184433)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Internal medicine residents received no formal education on standardized

patient handoff, which led to wide variations in the quality of handoffs and posed a risk to patients' safety.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The primary objective was to teach residents the I-PASS model for handoff. Additionally, an electronic medical record (EMR)-based tool was provided to residents. The final goal was to assess residents' perceptions of the training, the tool, and compliance with the I-PASS format.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Residents participated in a one-hour resident-led session that included didactics and case-based practice. There were 60 internal medicine (IM) and 18 medicine-pediatrics (MP) residents. A template macro was disseminated to the residents through the electronic medical record (EMR) to standardize written handoff.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Before the sessions, residents were surveyed to assess baseline knowledge and practices. Post-intervention surveys were sent immediately and again three months following the intervention. Survey data is based on residents who responded to the surveys and is not inclusive of all residents who completed the training. The n value represents total number of respondents and includes residents in IM post-graduate years (PGYs) 1-3 and MP PGYs 1-4.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Only 18% of IM and MP residents (n=22), reported any previous training on standardized handoff. Immediately post-intervention, 92% of respondents (n=39), rated the training as valuable. At three months post-intervention, 94% of residents (n=31) selected that the EMR macro improved patient safety and streamlined written handoff creation. The EMR tool enabled 80% of residents (n=31) to quickly create a high-quality, I-PASS format written handoff. However, after three months, only 32% (n=31) of residents reported that contingency planning was always included in the written handoff.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?):

The education sessions were well received yet results reveal that residents omit important components of the I-PASS model after only three months. Dissemination of an EMR-based macro proved simple and effective. As we move forward, we plan to further assess uptake of the tool and the I-PASS format through random chart review of handoffs and to improve upon the training based on feedback from participants. Clearly there is room for increased adherence to standardized handoff and we hope to define the ideal timing and format of further trainings.

STANDARDIZING FRAGILITY HIP FRACTURE CARE USING AN ELECTRONIC HEALTH RECORD APPROACH

Kencee K. Graves¹; Polina Kukhareva¹; Kensaku Kawamoto²; Logan A. Horne¹; David Rothberg¹; Jacob McKenna¹; Steven M. Johnson¹; Jeffrey Young¹; Mark A. Supiano¹. ¹University of Utah, Salt Lake City, UT; ²University of Utah, Sandy, UT. (Control ID #3163409)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Fragility hip fractures are a devastating injury to elderly patients, resulting in significant morbidity, mortality and cost; however, in-hospital care for these patients can be variable.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Our first objective was to standardize the care for

patients with fragility fracture as much as possible. Our second objective was to provide feedback to providers on the quality of their hip fracture care as defined by pre-determined metrics. Finally, we aimed to provide notification to specific providers when a patient is admitted to the hospital.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): First, we implemented a forced function hip fracture order set containing evidence-based interventions, such as treatment for osteoporosis, anticoagulation to prevent venous thromboembolism, and early physical therapy. Second, we implemented an electronic score card to provide quarterly feedback to providers, including orthopedics and internal medicine; and third, we designed an electronic alert to targeted providers notifying them of patients admitted with fragility hip fracture to allow for data analysis and follow up for these patients. This program was for patients older than 65 years of age admitted with hip fracture to a single academic medical center.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): To evaluate the effects our program, we compared adherence to components of the order set, readmissions, mortality, length of stay and total direct cost.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): For statistical analysis, we compared a pre-intervention cohort of 39 patients to two post-intervention cohorts. Post-intervention cohort 1 includes 115 patients who received care with the order set and whose providers received score card feedback. Post-intervention cohort 2 included 50 patients who received the interventions in cohort 1 and, in addition, whose providers received an electronic alert of their admission. Our primary outcome was defined as receiving all components of the order set, considered to constitute "perfect care." The percentage of patients receiving "perfect care" increased from 15.4% for the pre-intervention cohort to 33.6% for post-intervention cohort 1 and to 45.1% for post-intervention cohort 2 ($p=0.012$). Of our individual components, use of osteoporosis medications increased from 69.2% pre-intervention to more than 88% post-interventions ($p=0.006$). However, there were no significant differences seen in mortality, 30-day readmissions, or total direct cost.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Implementation of a hip fracture care improvement program with the goal of standardizing care is feasible in a single academic medical center. However, this program did not improve the outcomes of mortality, length of stay or readmission in our cohort. Future studies with larger sample size will be needed to determine if better adherence to perfect care will be associated with improved mortality, length of stay or readmission. Outcomes such as delirium incidence, mobility, or return to home may be more sensitive to assess the benefits of "perfect care." While this method may be reproducible, the benefit of dissemination is unclear.

STOP THE MADNESS: A TALE OF TWO DE-IMPLEMENTATION INITIATIVES TO REDUCE EHR BURDEN IN PRIMARY CARE

Ling Chu¹; Ethan Halm²; Duwayne L. Willett³. ¹UT Southwestern, Dallas, TX; ²Univ of TX Southwestern Med Ctr, Dallas, TX; ³University of Texas Southwestern Medical Center, Dallas, TX. (Control ID #3179325)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Frustration with the burden of using EHRs is a major driver of physician burnout, can selective de-implementation decrease EHR burden?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Reduce primary care providers (PCPs) EHR burden by identifying opportunities to reduce the amount of low value added information to be reviewed and eliminate unnecessary keystrokes. 2. Showcase success of two practical, high impact de-implementation initiatives that reduced EHR inbox message volume in PCPs inbox and eliminated most second password authentications.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Our first initiative focused on ways to reduce the exploding volume of Epic EHR inbox messages among PCPs. Analysis of 3 years of inbox messages received by PCPs in GIM and Family Medicine (FM) found that "CC Chart" messages were the most common (332K) and more frequent than Results (256K), Patient Calls (234K), and any other type. PCPs were receiving 3 times as many "CC Chart" messages in their inbox compared to specialty physicians. PCPs validated that almost none of these CC Charts were helpful. The EHR was programmed to automatically send a copy of every specialty outpatient encounter to the PCP. This programming decision was made over 10 years ago and then propagated to over 50 clinic-specific settings over the years (including routine dental and ophthalmology visits). Consensus was reached among physician leadership and frontline PCPs to de-implement this automatic messaging and use only intentional CC Chart routing. Our second initiative sought to eliminate the need for 2nd password authentication for medication ordering. Our EHR build required providers to enter their password to approve nearly all types of orders (not just controlled substance orders) even though they were already logged in. After garnering operational and IT leadership support, the EHR team located and removed the automated programming point for automatic CC Charts and turned off the requirement for 2nd password entry for non-controlled medication ordering.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Reduction in number of CC Chart messages and 2nd password entries

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Prior to the intervention, the number of CC Chart messages received by GIM PCPs was growing steadily, exceeding 9,500 per month. After "DCing the CC", the number of messages dropped nearly in half, to under 5,000 messages per month. Among FM PCPs, CC Chart messages dropped from 2,500 to 1,000 per month. Specialty departments served as controls and saw no decrease in their CC Chart messages. In our second initiative, eliminating the need for 2nd password entry for non-controlled medication orders saved 692,465 password entries among 1,917 clinicians over a 7.5 month period in our outpatient setting, 1,961,674 in our hospitals for a total of 2,654,139 entries saved.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Identifying common EHR tasks that are low value added or redundant and eliminating them can reduce EHR burden. While the natural history of EHR adoption is to add more and more features and requirements, more attention is needed to periodically review and de-implement unnecessary or dated ones.

SUSTAINABLE IMPROVEMENT OF COLORECTAL CANCER SCREENING RATES THROUGH A RESIDENT LED INITIATIVE
Daniel Jonas¹; Matt Welzenbach^{1, 1}; Patrick Ryan². ¹University of Colorado, Denver, CO; ²Denver Health and Hospital Authority, Denver, CO. (Control ID #3183608)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): How can we increase our colorectal cancer screening rates in a sustainable, automated method at a Federally Qualified Community Health Center?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): At the Westside Adult Internal Medicine Clinic in Denver, Colorado our colorectal cancer screening rates were below a hospital wide goal. We aimed to increase our colorectal cancer screening rate from 54% to a hospital wide goal of 65% using a resident led quality improvement project by focusing on increasing screening through FIT card testing.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): This was a resident led quality improvement project at the Westside Adult Primary Care clinic, an outpatient clinic affiliated with Denver Health in Denver, Colorado. We first underwent a root cause analysis to identify reasons why our screening rates were low. We then underwent three plan-do-study-act cycles. First we had medical assistants pend FIT orders for provider on patients who were due for colorectal cancer screening. Our second cycle implemented a patient handout in exam rooms to cut back on time spent discussing screening options. And finally, we developed an automated system through our electronic medical record to identify patients prescribed FITs and who had not returned them. We then sent reminder letters to these patients to return their FIT kits.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The quantitative metric used to measure success were electronic medical record system reports that calculate the percent of eligible adults who have received colorectal cancer screening which we did before and after initiation of the new screening protocol. Additionally we broke this data down to individual physicians in the clinic and provided them with this data monthly. A qualitative metric used to measure success was ongoing adoption of the new screening protocol in the clinic after completion of the project and adoption by other clinics as well.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Over an academic year from June 2017 to May 2018 we increased our clinic wide screening rate from 54% to 63%. The process developed empowered medical assistants to chart review and pend FIT orders as well as created an automated reminder letter to return kits. This has continued to be utilized in the clinic and has been adopted by other clinics in the Denver Health Hospital System with similar success.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Successful resident-led quality improvement projects are those that can be become automated with minimal time commitment and have buy-in from clinic leadership and hospital administration leadership. Annual FIT testing with medical assistant pended orders for providers and automated reminder letters to return FIT kits is a successful approach to increase colorectal cancer screening rates.

SUSTAINING MINDFUL LABORATORY ORDERING PRACTICES: A CULTURE CHANGE

Rachna Rawal¹; Ara Vartanyan²; Paul Kunnath³; Oluwasayo Adeyemo¹; Hala Saad⁴; Alex Lane¹; Jennifer Schmidt⁵. ¹Saint Louis University, St. Louis, MO; ²Saint Louis University School of Medicine, St. Louis, MO; ³Saint Louis University School of Medicine, University City, MO; ⁴Saint Louis University Hospital, Saint Louis, MO; ⁵Saint Louis University, Saint Louis, MO. (Control ID #3183457)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): How to sustain a high-value care mindful lab ordering culture in a medicine residency program?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Recognize barriers to mindful lab ordering Engage in multi-faceted interventions to promote mindful lab ordering

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The United States is in a health quality crisis; we must transform to a high-value, low-cost healthcare culture. To achieve such a culture, trainees must learn high-value care habits. We developed a 95-week longitudinal study to promote mindful laboratory habits in an Internal Medicine residency program.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Subjects included residents and attending physicians on the general medicine inpatient service. The primary aim was to decrease total laboratory orders (BMP, CMP, CBC with and without differentials) by 15% within one academic year and to sustain these changes. Total duration was 95 weeks (control—15 weeks, interventions—80 weeks, divided into 5 16-week phases); each was cumulative. Phase 1: resident education, phase 2: EMR (Epic) changes, phase 3: interactive cases, phase 4: attending physician education, phase 5: night-float resident education and additional EMR changes. Aggregate order data was obtained from the EMR and culture change was assessed with pre/post surveys. Primary outcomes were total labs ordered, the type of laboratory panel ordered, resident attitudes of mindful laboratory ordering and money saved. Secondary outcomes included length of stay, 30-day readmission rate, case-mix index and venipuncture utilization.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Survey data showed increased resident perception of mindful lab ordering from 40% (32 weeks) to 85% (80 weeks) ($p<0.05$). Additionally, residents reported team discussion of laboratory ordering increased from 25% (0 weeks) to 85% ($p<0.05$). EMR lab frequency utilization data showed a 50% decrease in use of "daily" frequency and a 50% increase of "one-time" ordering option. By week 45, there was a 20% decrease in total labs ordered/week; this was sustained through week 95. Both BMP and CBC without differential increased while CMP and CBC with differential decreased per a thousand patient days. Hepatic panels, a balancing measure, did not significantly change. Secondary outcomes demonstrated a downturn in 30-day readmission rate (1.18 to 0.92) and length-of-stay (LOS) (1.02 to 1.0) and uptrend incase-mix index (CMI) (1.37 to 1.83). The percentage of patients on medicine service undergoing venipuncture also decreased.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): We believe we have created and sustained a cultural change toward more mindful laboratory ordering. Residents not only perceive that they are more mindful, they have actually decreased the number of labs ordered. While we cannot attribute the downturn in LOS and readmissions to our study, we can state that decreasing labs did NOT result in an increased LOS or readmission rate. We also know that our decrease in laboratory orders is not secondary to lower acuity patients. Additionally, in the setting of higher acuity patients we have seen a decrease in the percentage of patients undergoing venipuncture.

TEAM-BASED PROCESS FOR MEDICATION RECONCILIATION & REVIEW IN AMBULATORY CARE

Celia Lu^{1, 2}; Christine Chim^{1, 2}; Danielle Ezzo^{1, 2}; Nissa Mazzola^{1, 2}; Rachel S. Kashan³; Daniel J. Coletti². ¹St. John's University College of Pharmacy & Health Sciences, Lake Success, NY; ²Northwell Health, Great Neck, NY; ³Yeshiva University, Ferkauf Graduate School of Psychology, New York, NY. (Control ID #3185199)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Discrepancies between the medications the patient is taking and those listed in the electronic medical record (EMR) can lead to medication errors and patient harm.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Develop, implement, and evaluate an interprofessional (IP) team-based medication reconciliation process, with the objectives of reducing medication discrepancies and medication errors.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): IMPACCT (Improving Patient Access, Care, and Cost through Training) is an internal medicine training practice where residents collaborate with medical students and trainees from psychology, physician assistant, and pharmacy programs. Our pharmacy-led IP medication review process consisted of four steps: "scrubbing" the chart, huddle, interview, and reconciliation. First, a pharmacy student identifies high-risk patients who need a medication review. The student then presents identified patient medication needs during the huddle and identifies team partners who can assist. Third, the student obtains a medication history with the patient and identifies discrepancies, while the partnering student focuses on adherence. During reconciliation, the team discusses identified discrepancies, updates the patient's medication list in the EMR, and communicates the plan to the patient.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): A coding system was utilized to classify medication-related problems and to record changes made to the treatment plan. We examined the frequency and types of discrepancies identified and the percentage of successfully updated medication lists.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A Plan-Do-Study-Act cycle was conducted examining 164 medication reviews. We used prior practice data to benchmark a 20% improvement in the number of identified medication discrepancies that were correctly adjusted in the patient's medical record. We identified 1 discrepancy in the vast majority of patients ($n = 133$; 81.1%) and found an average of 3.06 discrepancies per discrepant record (range = 1-10). A total of 95 patients (58.5%) had 1 discrepancy involving a daily prescription medication taken for a chronic condition. The most frequently identified medications included central nervous system agents ($n = 38$), cardiac medications ($n = 31$), gastrointestinal drugs ($n = 26$), prescribed analgesics ($n = 21$), and hypoglycemic agents ($n = 18$). The medication review team recommended a chart update to address 326 of the 407 identified discrepancies. Changes were successfully made to address 244 of these 326 discrepancies (74.8%). Of the charts for which medication reviews were completed, 68.9% were free of discrepancies by the end of the visit.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A structured IP medication review process encouraged identification and discussion of discrepancies, which improved accuracy of the medication lists. However, workflow barriers hindered successful

medication updates in some patients even after medication reconciliation was performed.

THE EAST BALTIMORE FARM TO CLINIC VEGETABLE INITIATIVE: A PILOT PROGRAM TO DISTRIBUTE VEGETABLES TO PATIENTS WITH CHRONIC DISEASE IN AN URBAN CLINIC

Theresa R. Aguilar¹; Amelia Cover²; Laura Harding-Fukushima³; Katherine Rediger^{2, 3}; Donald R. Miles^{1, 3}. ¹Johns Hopkins University School of Medicine, Baltimore, MD; ²Johns Hopkins University School of Nursing, Baltimore, MD; ³Johns Hopkins Community Physicians, Baltimore, MD. (Control ID #3184233)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Inadequate intake of healthy foods is associated with chronic disease, and East Baltimore Medical Center (EBMC) is located in a neighborhood where one third of residents lack access to fruits and vegetables.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Establish a partnership between an urban clinic and a local farm to provide fresh vegetables to underserved patients Assess the feasibility of a Community Supported Agriculture (CSA) model to distribute fresh vegetables to adult patients at a clinic in an under-resourced neighborhood Engage the EBMC patients in consumption of increased amounts of vegetables and healthy diet educational initiatives

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): EBMC, an outpatient office of Johns Hopkins, is in the Greenmount East neighborhood, which is predominantly black (96.6%) and 33.8% live in poverty. Heart disease is the leading cause of death. Primary food sources are corner stores, which have limited fresh vegetables, making it difficult to eat a healthy diet to reduce cardiovascular disease risk or contributing risk factors, like diabetes and obesity. The initiative was developed by health care professionals at EBMC and staff at Karma Farm of Monkton, Maryland. Fresh vegetable bags were distributed to patients with obesity, diabetes, or hypertension at EBMC weekly for 13 weeks during Summer 2018. Three monthly cooking classes were held.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Participants were surveyed for demographics, insurance, use of federal food assistance, and food insecurity, using a sensitive and specific 2-item screen. Those returning were surveyed for satisfaction to measure engagement. EBMC staff were surveyed to assess perception of patient food insecurity, program awareness, and likelihood of referring patients to a long-term program. Descriptive statistics and a Chi-square Test of Independence were performed with R. A focus group was conducted for qualitative feedback. In a one hour session, 7 participants were asked open-ended questions about program satisfaction and suggestions for future initiatives.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 541 CSA bags were provided to 421 participants. 75.5% were females. 44.9% had Medicaid insurance. 47.7% had federal nutrition assistance. 63% has food insecurity. Those with federal nutrition assistance were more likely to report food insecurity. 10% returned to pick up a bag. Those returning scored average satisfaction at 9.4 out of 10. 95% of those returning would want a weekly bag. Every cooking class participant would attend again. 95.7% of staff would refer patients to a long-term program. Focus group responses highlighted

appreciation of vegetables, benefits of cooking classes, financial barriers to healthy eating, and desire to learn about nutrition.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?):

Participants rated vegetable bags and cooking classes highly, corroborated by focus group qualitative data. We believe vegetable distribution and cooking classes are valuable for clinics with vulnerable patients. While the amount of vegetables provided was not enough to affect food insecurity, we believe this program fostered health behavior change among participants.

THE EFFECT OF A FRACTURE LIAISON SERVICE FOLLOWING HIP FRACTURE ON A VA POPULATION.

Sean Bradley^{1, 2}; Sarah Hall²; Yarbrough Peter². ¹University of Utah, Salt lake city, UT; ²George E Whalen VA Hospital, Salt Lake City, UT. (Control ID #3184397)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Determine if a Fracture Liaison Service (FLS) improves treatment of osteoporosis following first time hip fractures in a single VA population.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The objective of the intervention was: 1. Identify patients with hip fractures during hospitalization with a new diagnosis of osteoporosis. 2. Start appropriate medical therapy for newly diagnosed osteoporosis following hip fracture.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A Fracture Liason Service (FLS) is composed of a team of licensed practical nurses and an endocrinologist at our VA hospital. Inpatient nurses identifying high risk patients for osteoporosis on the wards with signs of fragility fractures, ie hip fracture by reviewing inpatient team list and referring new hip fractures to endocrinology via e-consult for appropriate management either during or post hospitalization. We performed a retrospective chart review. ICD-9 and ICD-10 codes for hip fracture and osteoporosis were queried for the fiscal year 2015 and 2016 at a single VA site (SLCVA) resulting in a total of 61 first-time hip fractures to be reviewed (31 in 2015 and 30 in 2016). Primary and secondary outcomes for each year were compared using a Chi-squared test.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Primary outcomes: 1. Referral to endocrine bone health via E-consult. 2. DEXA scan within 6 months of hip fracture 3. Bisphosphonate/denosumab initiation within 6 months of hip fracture. Secondary outcomes: 1. Vitamin D labs drawn within 6 months of hip fracture 2. Vitamin D/Calcium supplementation within 6 months of hip fracture 3. 1 year mortality following hip fracture

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): There was a significant difference in increased endocrine bone referral ($p = 0.03785$), medication use ($p = 0.000003$), vitamin D level drawn ($p = 0.023119$), and vitamin D supplementation ($p = 0.022705$) following the implementation of a fracture liaison service prior to the fiscal year of 2016. There was a trend towards significance in increased DEXA screening ($p = 0.058125$). There was no significance noted between calcium supplementation ($p = 0.822565$) or mortality ($p = 0.912117$) Interestingly, the one-year mortality rate for the two years was noted to be 42.62%.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The use of a fracture liaison service can capture patients with osteoporosis in an effective way to deliver appropriate work-up and treatment following hip fracture.

THE EFFECTS OF TELEHEALTH ON THE FREQUENCY OF PRIMARY CARE CLINIC VISITS

Morgan H. Randall¹; Jingwen Zhang²; Elizabeth B. Kirkland². ¹Medical University of South Carolina, Charleston, SC; ²MUSC, Charleston, SC. (Control ID #3185783)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Does patient participation in remote patient monitoring affect the frequency of primary care clinic visits?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Compare the frequency of primary care visits before and after enrollment in a remote patient monitoring program. 2) Compare the frequency of primary care visits between patients participating in remote patient monitoring to those not participating.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Telehealth has the potential to mitigate barriers to care and affect social determinants of health by providing access to medical professionals without requiring a patient's physical presence in a medical office. Our institution implemented a remote monitoring program targeting patients with uncontrolled diabetes and hypertension. Specifically, patients with a hemoglobin A1c greater than eight and with diabetes and hypertension managed exclusively by our primary care clinic are eligible to participate in a program utilizing a 2-in-1 automated device with glucose and blood pressure monitoring capability. Recorded values are transmitted directly via cell tower to a secure web server for review by healthcare providers. Based on this data, adjustments in medication regimens were made by physicians within the primary care clinic on a regular basis. This study compared visit frequency among patients who participated in the telehealth program and patients who were eligible but did not participate. While outcomes data are being assessed and will be reported elsewhere, we also aimed to discern whether enrollment in this program has altered the average number of clinic appointments for these patients before and after enrollment. The first available enrollment class offered after identification was used as the intervention date for the unenrolled cohort.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Success in this study was defined as a decrease in the average number of clinic visits for participating patients compared to the same period of time prior to enrollment or compared to eligible but non-participating patients.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A total of 55 telehealth participants and 80 eligible but not enrolled patients have completed 9 months follow up. Participation in telehealth did not decrease the average number of primary care clinic visits when comparing visit frequency pre- and post-enrollment for the participant group (3.9 vs 3.6, p=0.51). Furthermore, there was no difference in visit frequency between patients participating in telehealth compared to those who were not participating (3.6 vs 3.9, p 0.54).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Telehealth is a tool that has the potential to help

overcome barriers to care. Regardless of the effect of telehealth on the clinical outcomes for diabetes and hypertension, this study revealed no significant decrease in primary care clinic visits for patients participating in a telehealth program. This suggests that telehealth acts as a supplement rather than a replacement for primary care. As additional clinical data emerges and the follow up period is extended, the relationship between healthcare utilization and telehealth should be re-examined.

THE PRIMARY CARE PANEL RETENTION TOOL: A QUALITY IMPROVEMENT PROJECT TO REDUCE LOSS TO FOLLOW-UP IN A VA PRIMARY CARE CLINIC

Andrew T. Harris; Catherine Hoover; Mariel Zaun; Brendan L. Cmolik; Corinna D. Falck-Ytter. Louis Stokes Cleveland VA Medical Center, University Heights, OH. (Control ID #3186691)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can primary care panel retention be improved by a tool that identifies patients who are lost to follow-up?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Retain paneled patients by ensuring they have an encounter within the past 12 months and a future appointment or recall reminder 2. Promote a team-based approach to panel management across a large integrated healthcare system.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Primary Care Panel Retention Tool was implemented at the VA Northeast Ohio Healthcare System, the nation's 3rd largest 1a high-complexity facility with 14 primary care locations and 143 Patient Aligned Care Teams (PACTs) serving over 90,000 veterans. The Primary Care Panel Retention Tool is a web based application that: 1. Sorts patients by facility, Patient Aligned Care Team (PACT) and primary care provider (PCP) 2. Filters by last encounter with PACT team (< 10 mo, 10-12 mo, 12-24 mo, no encounter) 3. Identifies patients lost to follow-up (ie, no future appointment, return to clinic order or recall) 4. Triages patients based on likelihood of adverse outcomes using the Care Assessment Needs (CAN) We pilot tested the tool in one primary care PACT and modified the tool based on feedback. Following pilot testing, we decided to address the following key contributing factors as part of our intervention: 1. Develop a tool to identify lost to follow-up patients - the Primary Care Panel Retention Tool 2. Standardize the outreach process for veterans that are lost to follow up 3. Identify best practices for difficult to reach veterans 4. Standardize policy on how often veterans should be seen - ideally once per year 5. Develop a toolkit for handling common scenarios such as death, incarceration, moved, etc. 6. Standardize processes for depaining inactive patients Following multiple PDSA cycles, the Primary Care Panel Retention Tool was implemented across all primary care PACTs by September 2018. Each PACT was coached on use of the tool in their weekly team huddles. Outreach was targeted to patients not seen in the past 10-24 months.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Percentage of primary care patients not seen in the past year 2. Percentage of primary care patients with no scheduled follow-up (appointment, recall reminder or return to clinic order)

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Since starting data collection in December 2017, the number of primary care patients not seen within the past year has reduced from 10,039 (10.5%) to 6,127 (6.5%). The number of primary care

patients without scheduled follow-up has decreased from 21,704 (22.6%) to 16,061 (17.1%).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1. Primary Care teams can be empowered to control their own access 2. Repeated small tests/pilots allowed us to identify problems early and customize 3. Regular feedback from end users and customizability of the tool enhanced spread 4. Innovation and QI can work together. We developed an innovative solution, but it was addressing a recognized gap in care. The innovation was designed to address root causes. 5. Site visits and attending team huddle helped increased visibility and buy-in among team members.

THE SCOPE OF THE PROBLEM: A NOVEL MULTIDISCIPLINARY APPROACH TO REDUCE INPATIENT ENDOSCOPY DELAYS

Cameron Locke¹; Molly A. Kantor¹; Najiwa El-Nacheif¹; Kendall Beck¹; Sajan Patel¹; Helge Eilers¹; Ryan David²; Scott Pasternak¹; Bertina Herman²; Daniel Roseland¹; Sara Lewin¹. ¹UCSF, San Francisco, CA; ²UCSF Health, San Francisco, CA. (Control ID #3184690)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Endoscopies are commonly performed in the inpatient setting, and due to organizational complexity are prone to delays, which can lead to frustration amongst care providers and patients, patient discomfort from prolonged nil per os time, and excess costs from lengthened hospitalizations.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Identify and characterize etiologies of delay to inpatient endoscopy 2. Reduce avoidable inpatient endoscopy delays to <5% by optimizing workflow, scheduling, and staffing.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A survey of hospitalists at our large, urban university medical center identified endoscopy as a common contributor to delays in patient care. Representatives from gastroenterology, anesthesiology, hospital medicine, inpatient nursing, and endoscopy nursing were engaged to create a multidisciplinary team to evaluate and intervene upon these delays. Root-cause analysis demonstrated multifactorial causes of endoscopy delays, and baseline data showed that 16.4% of inpatient endoscopies were delayed due to reasons characterized as avoidable, with an average length of delay of 1.22 days. The identified highest impact contributors to avoidable reasons for delay were endoscopy nursing availability, anesthesia provider availability, and volume of competing scheduled outpatient procedures. Three interventions to address these common causes of delay were implemented. First, dedicated anesthesiologist availability for inpatient endoscopy cases was provided on prespecified weekdays. Second, the endoscopy nursing staff instituted later and extended shifts to accommodate more procedures. Third, the on-call gastroenterologist reduced the number of daily scheduled outpatient endoscopic procedures, allowing for increased endoscopy suite allocation to inpatient procedures. The proposed interventions underwent several plan-do-study-act cycles to identify optimal implementation, with a target goal of 5% delay rate.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Following intervention implementation, number of total endoscopies and number of delayed endoscopies, with subgroup analysis of cause of delay, were tracked for a 10 month period.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Scheduling conflicts, provider availability, and failure of adequate bowel preparation were found to be the most common causes of delay. Following implementation of the above interventions, the average rate of avoidable endoscopy delays fell to from 16.4% to 3.5% while average endoscopies per month remained constant.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Successful completion of inpatient endoscopies frequently requires close coordination among nurses, hospitalists, gastroenterologists, and anesthesiologists. Given the complexity of this multidisciplinary involvement, as well as variability in patient factors like clinical stability and presentation, endoscopies are prone to delays. However, multidisciplinary examination and optimization of nursing and anesthesiology availability coupled with optimal endoscopy suite utilization can significantly reduce inpatient endoscopy delays, independent of patient factors.

TOBACCO CESSION: BEYOND THE AFTER-VISIT SUMMARY

Richard Altman²; Hillary Chrastil²; Lauren Drake²; Carmen L. Lewis¹. ¹University of Colorado, Denver, CO; ²University of Colorado, Aurora, CO. (Control ID #3178346)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Tobacco cessation is one of the most high value interventions available with brief intervention by clinicians increasing cessation by 1-3%; however, tobacco interventions are underutilized in ambulatory settings with national data showing only 20% of current tobacco users had tobacco cessation documented during visits with clinicians.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Implement clinical architecture to maximize the opportunity for tobacco cessation interventions in the clinic setting. 2. Evaluate the implementation strategy.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The intervention was first implemented at an academic General Internal Medicine practice in Denver (Practice A). The intervention was then implemented at additional academic practices, one Family Medicine practice and one of combined Family Medicine and General Internal Medicine practice (Practices B and C). Each practice received a Tobacco Implementation Package (TIP) that included baseline data, electronic medical record (EMR) tools, training tools, and report access. EMR tools included MA and clinician workflows in which the MA collects current tobacco use information and the clinician receives a prompt with support for documenting brief tobacco counseling, an assessment, and plan. Training tools included a presentation and EMR tip sheets. Report access included audit and feedback and care management tools.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Proportion of visits where 1) tobacco status was reviewed by the MA and 2) MA asked if the patient was ready to quit (RTQ). 2. Proportion of visits among tobacco users with clinician documentation about tobacco in the assessment and plan. 3. Practice use of new reports.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): At Practice A, baseline data show that tobacco status was reviewed at 91% of visits and RTQ was asked 46% of the

time. At Practices B and C, baseline rates for reviewing tobacco status were 94% and 96% and RTQ was asked 20% and 21% of the time. After TIP, Practice A reviewed tobacco status 94% of the time and asked RTQ 75% of the time, Practice B reviewed tobacco status 92% of the time and asked RTQ 32% of the time, and Practice C reviewed tobacco status 99% of the time and asked RTQ 32% of the time. After TIP, Practice A clinician documentation trended upward over 12 months (40 to 51%) as did Practice B over 5 months (10 to 25%), Practice C demonstrated a downward trend over 3 months (26% to 19%). On average, Practice A accessed the reports eight times per month, Practice B accessed the reports four times per month, and Practice C did not access the reports.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): MA performance of reviewing current tobacco status was high and remained high. TIP improved performance of MAs asking current tobacco users if they are ready to quit. Clinician documentation is trending up at two practices and trending down at one, who has had the least amount of time with the TIP. During this implementation period, the practices who accessed the reports saw improvement in their clinician documentation. This project is on-going so will include an additional practice site and data at the time of presentation.

UNCOVERING BARRIERS TO PRESCRIBING POST-DISCHARGE NICOTINE REPLACEMENT THERAPY FOR HOSPITALIZED SMOKERS

John Landefeld^{1, 2}; Scott Goldberg^{1, 2}; Joseph Clement^{1, 2}; Maya Vijayaraghavan^{1, 2}. ¹ucsf, San Francisco, CA; ²Zuckerberg San Francisco General Hospital, San Francisco, CA. (Control ID #3184785)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Despite guidelines recommending that all hospitalized smokers receive tobacco-cessation counseling and nicotine replacement therapy (NRT) during hospitalization, low-income patients who have high rates of smoking and who are frequently cared for in public hospitals often do not receive this treatment.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Our hospital implemented an Alcohol and Tobacco Treatment Team (ATT), comprised of licensed vocational nurses overseen by a Clinical Nurse Specialist to deliver tobacco and alcohol cessation interventions to hospitalized patients upon admission. The focus of this abstract is on tobacco cessation interventions.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The ATT is an inpatient service that provides at least one-time, in-person tobacco cessation counseling, outpatient referrals for cessation, and medication recommendations during the inpatient stay and upon discharge to all smokers on admission.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): While the ATT achieved near complete success in reaching all hospitalized smokers for counseling, the rates of receiving discharge NRT was substantially lower. We examined characteristics associated with lower rates of being prescribed NRT on discharge. Our analysis included 1577 hospitalized smokers, seen for a single visit by the ATT in 2017. We extracted the following data from the electronic health record in order to examine factors associated with receiving discharge NRT: patient demographics, insurance status (Medicaid, Medicare, private, uninsured), English proficiency status (English-speaking vs non-English-speaking), and service type (Medicine, Cardiology, Family Practice, Neurology, and Surgery/Surgical

subspecialties). We also conducted six in-depth, semi-structured interviews of Internal Medicine housestaff.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Of the patients, 75% were male, 90% were English-speaking, and 93% were covered by public health insurance (i.e. Medicaid or Medicare). Whereas 26.2% of patients received NRT on discharge, 56.2% refused NRT, and 17.2% were recommended to receive NRT but were not prescribed. Younger patients and non-English-speaking patients were more likely to be recommended to receive NRT but not receive a prescription ($p < 0.03$). Patients on the medicine and family practice services were more likely to receive discharge NRT than patients on other services. In interviews, housestaff identified several barriers to prescribing NRT: 1) ATT recommendations are often communicated via text page later in the day when the primary medical team is off; and 2) ATT recommendations are not documented in the same area of the EHR used for inpatient care.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A single-enterprise EHR may enable improved communication around cessation care between the ATT and primary MDs, and could facilitate automatic prescribing of NRT for eligible and interested patients at discharge. Additional quantitative and qualitative analyses are necessary to understand the reasons behind the lower screening and prescribing rates of discharge NRT for non-English-speaking patients as well as patients on non-medicine services.

USE OF ASSESSMENTS AND FACILITATION TO REDESIGN AN INTEGRATED HEALTH SYSTEM

Stella Safo; Brooke Gogel. Icahn School of Medicine Mount Sinai, New York, NY. (Control ID #3174062)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Redesigning an urban primary care network to deliver value-based care

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To review an approach to large scale primary care redesign To evaluate how an assessment tool and facilitation impacts primary care redesign

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Mount Sinai Health System (MSHS) in New York is an integrated health system aiming to become a population health management center. As part of these efforts, 47 primary care practices are undergoing comprehensive assessment and implementing improvements around technology, quality improvement (QI) infrastructure, and operational workflows. Practice facilitators, individuals trained in QI and project management, are paired with practices to guide them through redesign initiatives. The Redesign Team developed an assessment tool to determine the amount of practice facilitation needed for each practice. The tool evaluated physical space, technology efficacy, population health management capabilities, accessibility, culture of transformation, staffing/workflows, and patient population. Assessments were administered over visits at the first 8 sites through a series of observations and key informant interviews with practice leadership and staff. Facilitators were then assigned to practices based on the results.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Each practice is evaluated by metrics defined broadly by workflow optimization, quality improvement, and technology. Measures of success include evaluating staff satisfaction, teaching

Lean QI to practice leadership, increasing same day access, and implementing daily team huddles and standardized workflows around care transitions.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Results varied across each category. For example, 4 practices showed weakness in population health metrics as measured by their lack of proactive patient empanelment, resulting in episodic care. Within staffing metrics, 3 practices had limited ancillary staff, meaning resources like behavioral health and pharmacy were either unavailable or only remotely available. Certain challenges were experienced by all 8 practices, including after hours care alternatives, limited workflow standardization, staffing vacancies, inadequate EHR training, minimal usage of population health tools, and inconsistencies in QI engagement. Based on these findings, practices were assigned a facilitator. 1 practice which was struggling with population health and leadership received a combination of facilitation and intensive regional leadership oversight. 5 practices with moderate rating received embedded facilitation. 2 practices demonstrated strength across all categories and thus did not receive continuous facilitation.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This case represents an important effort by an integrated urban health system to become a population health manager. Our experience at MSHS suggests that redesign can be rolled out at scale if a health system is willing to invest in certain resources; in our case, we designed an easy-to-administer assessment tool which then allowed us to allocate practice support (in the form of facilitators) to the appropriate practices.

USING ACGME MILESTONES TO IMPROVE DIABETES MANAGEMENT

Emily D. Fondahn; Melvin Blanchard. Washington University, St Louis, MO. (Control ID #3164099)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Does linking practice-based milestones to completion of diabetes foot exam improve performance?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Improve percent of diabetic patients with up-to-date foot exam Implement standard method to assess residents on PBL1 and PBL2 milestones

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Residents received an email twice per year with their individualized diabetes quality metrics, along with overall clinic performance on the quality metrics for the preceding 6 months. The residents completed a chart audit to determine the number of diabetic patients having an up-to-date foot exam performed and documented. Patients were excluded from the chart audit if the primary care physician was incorrect, had only been seen once in the clinic or followed for less than a year, did not have diabetes, or had a lower extremity amputation. The residents emailed their results to the Associate Program Director (EF). The results from the diabetes foot exam chart audit were linked to assessment on the following subcompetencies: Monitor practice with a goal for improvement (PBL1 1) and Learns and improves via performance audit (PBL1 2).

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The goals were to achieve at least 80% of diabetic patients with an up-to-date foot exam and have 100% of residents complete the chart audit.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The percent of residents who submitted their diabetes data each year was very high (96-100%). The overall foot exam rate for the clinic increased from 56% to 72%. The percent of patients with diabetic foot exams improved each year of residency, with the largest improvement between first and second year (PGY1- 56%; PGY2-70%; PGY3-72%). There were no meaningful, sustained changes in other diabetes metrics, include HbA1c control, blood pressure control and screening for nephropathy.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Developing a standard method to assess PBL1 milestones across a large residency program can be challenging. Having clear expectations and a unified goal for the clinic were critical for implementation of this project and buy-in from the residents and attendings.

USING TELEHEALTH TO IMPROVE PATIENTS' POST-DISCHARGE ACCESS TO PCPS, FOLLOWING DISCHARGE FROM THE HOSPITAL

Priyanka Agarwal¹; Tannaz Safari-Vejin³; Nathaniel Gleason²; Yumiko Abe-Jones¹; Michelle Mourad¹. ¹University of California, San Francisco, San Francisco, CA; ²UC San Francisco, Nathaniel Gleason, CA; ³Lincoln Memorial University, Harrogate, TN. (Control ID #3185300)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The transition home from the hospital is a high-risk time for patients, and prompt follow up with a patient's PCP is important. Due to primary care and patient access constraints, only 38% of patients with a PCP discharged home from hospital medicine see their PCP within 2 weeks of discharge, at our institution.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The goal of the Post-Discharge Video Visit Program was to increase patient access to PCPs in the post discharge period, and to have 100% of patients discharged home from the hospital medicine service seen by their PCP within 2 weeks of discharge. To do so, we piloted a program in which patients discharged home from hospital medicine were offered a Video Visit (VV) with their PCP.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The program was implemented as follows: The telehealth discharge coordinator (TDC) ran a custom Epic Workbench report to identify eligible patients on the hospital medicine service (patients being discharged home, with a UCSF PCP). The TDC approached eligible patients to offer a VV with their PCP; in-person visits were preferentially booked as possible. PCPs of interested patients were emailed asking if they were amenable to conducting a VV. VVs were then conducted using the Zoom platform.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The following metrics were collected: a) Volumes of patients discharged home from the hospital medicine service, b) Volumes of patients offered and/or scheduled for a VV with their PCP d) Volumes of patients discharged home who were able to see their PCP in person or via telehealth, and e) Volumes of PCPs who participated. Qualitative reasons for declining VVs were also collected.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The program was conducted from July-December 2017, over a period of 64 days. During this period 1236 patients

were discharged from the hospital medicine service. 649 patients were discharged home and 171 of these patients had a UCSF PCP, representing the patient population eligible for the Program. 125 patients were approached by the TDC, and of those 56 patients (45% of those screened), expressed interest in a post discharge VV with their PCP. Of these 56 patients, 14 had VVs scheduled, with 11 VVs completed (or 6% of the eligible patient population). 69 screened patients declined VVs due to a preference for an in-person visit (n=36 patients), lack of access to VV technology (n=14 patients), lack of comfort in conducting a VV (n=9 patients), or for other reasons (n=10 patients). 36 PCPs were approached to conduct a VV for their patient; 20 PCPs were amenable, and 10 PCPs participated in the program. 16 PCPs declined to participate due to lack of availability (n= 5 PCPs), a preference for an in-person visit (n=7 PCPs), or a lack of comfort in conducting VVs (n=4 PCPs).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Patients do have an interest in engaging in care using Telehealth. However, the post-discharge period may not be the ideal setting to encourage telehealth adoption based on our program's low adoption rate. In a specific patient population, post discharge VVs may be a way to increase access to PCPs following hospital discharge.

UTILIZATION OF PATIENT NAVIGATORS: AN INNOVATIVE METHOD FOR CONNECTING PATIENTS WITH COMMUNITY RESOURCES WITHIN THE SOCIAL HEALTH ALLIANCE TO PROMOTE HEALTH EQUITY (S.H.A.P.E) PROGRAM.

Rachael Odusanya²; Jane Lindahl²; Johanna Martinez³; Omolara T. Uwemedimo¹; Shari Jardine¹; Eun Ji Kim⁴. ¹Northwell Health, New Hyde Park, NY; ²Zucker School of Medicine at Hofstra/Northwell, Lake Success, NY; ³Northwell Health, Lake Success, NY; ⁴Northwell Hofstra School of Medicine, Lake Success, NY. (Control ID #3183353)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Many programs have adopted social determinants of health (SDH) screening and referral processes, however, there is a need to provide support and ensure that patients are utilizing referrals.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) To recruit student interns as Patient Navigators (PNs) to act as social support staff in order to address SDH and follow-up with patients continuously for 12 weeks. 2) To equip PNs with motivational interviewing, cultural competency, and resource navigation skills that allow for patient centered follow-up. 3) To examine PNs impact on patient satisfaction and resource utilization.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

Our health system's Social Needs Screening Program was established as a way to identify and address adverse SDH in Internal Medicine and Pediatric patient populations. The program includes undergraduate students interested in healthcare, health policy, and social work as PNs. They screen patients for unmet social needs and help them navigate community resources. PNs completed a week-long training on SDH content, the screening process, motivational interviewing, cultural competency, community health organizations, and a medical legal partnership. They also precept case managers and physicians to get clinical experiences. The training prepares PNs for in-depth patient interaction during the screening and 12 week follow-up process, where patients are followed bi-weekly via telephone, e-mail or in-person.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We evaluate the effectiveness of PN social support in the clinical setting by examining; questions centered around patient experience with program as well as evaluation surveys on training and overall PN experience, percent of patients with unmet needs who are connected to resources, and percent of patients who successfully utilize resources within 12 weeks,

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In 2018, of the 326 patients who screened positive for social needs, 152 (47%) accepted PN assistance. Of those, 81 (53%) were connected to resources. To date, 11/16 (69%) who have completed the navigation process have successfully utilized the resources provided. When asked "How helpful did you find this experience," 73% (n=8/11) of patients found the process helpful or very helpful. A survey of current PNs demonstrated that 88% (n=14/16) have a better understanding of SDHs than before participating in program, and 69% (n=11/16) believed that the week of training prepared them for their role.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The use of PNs to provide dedicated screening and referrals to address resource needs in a primary care setting allows for a patient-centered approach to addressing SDH through "warm hand-offs" to community health resources, personalized follow-up and navigation services. Integration of the PN's into clinical sites has alleviated the burden on other clinical staff and providers, who often may not have time to address SDH with their patients. Additionally, having bilingual Navigators, who have been trained in cultural competency and motivational interviewing allows for an added level of comfort and trust to promote patient engagement in the program.

VA VIRTUAL PRIMARY CARE PROVIDERS REDUCE OPIOID USE AND INCREASE OPIOID SAFETY IN RURAL VA CLINICS.

Anna Abramson¹; Henry Crevensten². ¹UCSF/Veterans Affairs, Mill Valley, CA; ²University of California, San Francisco, San Francisco, CA. (Control ID #3186111)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Rural communities have the highest rates of opioid prescriptions and opioid-related deaths, yet lack consistent access to primary care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Assess the opioid prescription metrics in rural community clinics affiliated with the San Francisco Veterans Affairs Health Care System before and after initiation of a virtual primary care program. 2. Improve opioid prescription safety through continuous patient panel management.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Rural clinics in socioeconomically disadvantaged populations are experiencing staff shortages and rely on locums and gap provider coverage. Patients with chronic pain require continuity of care for successful pain and opioid management. In 2017, San Francisco Veteran's Affairs Medical Center implemented a virtual primary care team known as "Teleprimary Care" to increase continuous primary care access by leveraging video teleconferencing modalities. Teleprimary Care providers (TelePCPs) were integrated into existing multidisciplinary teams to cover one or more panels among three chronically understaffed rural clinics. This review focuses on

the largest regional rural clinic ("Clinic A") to demonstrate the trends seen in all 3 clinics. Clinic A has 2600 patients on 5 patient panels. A single in-person primary care provider had been at the clinic for several years prior to the study period and maintained their existing panel during the 12 months studied. Three TelePCPs shared 2 patient panels of which one TelePCP served as clinic medical director. The other 2 panels had 7 locums and 9 gap coverage providers over 12 months.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Decrease in number of patients receiving greater than 90 MEDD and co-prescription of opioid and benzodiazepines.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Nationally in the VA in 2018, the percentage of patients with greater than 90 morphine equivalent daily doses (MEDD) decreased from 1.13 to 0.86%. Regionally at the SFVA, >90 MEDD scripts decreased from 1.5 to 1.2%. The Rural Clinic A panel covered by the single, in-person continuous PCP, >90 MEDD scripts decreased from 0.97 to 0.61%. Rural Clinic A panels covered by TelePCPs >90 MEDD scripts decreased from 4.7% to 1.2-1.8% over 12 months. Eleven months after implementation, of the 27 patients on > 90 MEDD written in 1 month: 4 prescriptions (15%) were written by PCP (1 in-person, 1 virtual) of 925 paneled patients; 17 prescriptions (63%) by gap providers (3 locums, 1 virtual) of 973 paneled patients; and 6 prescriptions (22%) written by medical director for his panel and unassigned patients. After integration of the virtual PCP teams to Clinic A, the number of patients with co-prescription of benzodiazepines and opioids decreased from 2.2% to 1.3%, compared to VA national level of 1.14% to 0.86% and SFVA level of 1.25% to 1.03%. These trends were also observed at the other 2 rural clinics that were assigned TelePCPs.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Adequate pain assessment and opioid management requires continuity of primary care to patients in rural communities. Consider virtual primary care providers for management of chronic pain patients.

VIDEO VISITS IN PRIMARY CARE: A FEASIBLE AND CONVENIENT ADDITION TO TRADITIONAL CARE

Kathryn L. Hughes¹; Susan B. Glick²; Anthony J. Perry²; Marisa Truesdell²; Amanda Tosto²; Lisa Ravindra². ¹Rush University Medical Center, Highland Park, IL; ²Rush University Medical Center, Chicago, IL. (Control ID #3163533)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can the addition of video visits enhance a fee for service practice environment?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Explore patient interest in video visits for low acuity convenient care Maintain continuity of care for patients with non-urgent medical conditions Evaluate the feasibility and acceptability of video visits in primary care

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We initiated a video visit (VV) program for established primary care (PC) patients at a large urban academic medical center. A committee of clinicians, information technologists, and administrators met twice weekly for 3

months to develop workflows, acquire hardware, train staff, and set goals. Patients were notified of VVs via email and flyers. We used an established video platform in the electronic medical record. Physicians used a tablet in an exam room and a headset with a microphone. Patients accessed VVs via their online portal using smartphones or computers with a camera. 9 medical assistants and 3 nurses were trained in VV execution. VVs were piloted by 2 physicians for 23 acute, non-urgent conditions, including urinary tract infection, cough, contraception, and follow up at physician's discretion. After a free 6-week pilot, patients paid \$49 per visit. Patients received a 5-question post-visit survey regarding convenience, satisfaction, need for additional care, alternative care options, and comparison to an in-person visit.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Success was assessed via number of VVs completed, number of patients utilizing the program, net promoter score (NPS), relative value units (RVU), and a post-visit patient survey (PVS).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): During the pilot, 2 physicians completed 8 VVs in the course of a normal workday with 8 patients (7 women, 1 man). One 19-year-old man rescheduled due to lack of internet access. VVs were scheduled with the patient's PC physician. Mean age was 39.2±17.7 years. Maximum VV time was 15 minutes. Conditions addressed included anxiety, acute sinusitis, travel advice, contraception, urinary tract infection, low back pain and follow up (herpes labialis and hydrocele). Each visit earned 0.97 RVUs. 6 patients completed PVS. All (6/6) completed visits without needing further care and reported the visit was easy to complete. Were VVs unavailable, 2/6 respondents would have seen a doctor in person, 2/6 would have visited a retail clinic, and 1/6 would have visited another medical center. All (6/6) rated VV quality equal to that of an in-person visit. NPS was 60% (n=5). Key challenges were privacy, internet connection, and protocols for refunds and rescheduling. Physician concerns included continuity of care, reimbursement, and inability to examine patients.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Incorporating VVs in PC is both feasible and acceptable to patients. Were VVs unavailable, half of our patients would have sought care outside of our organization. For our VVs, the NPS, a measure of customer loyalty, was comparable to that of Apple laptops (63%), iPhones (60%), and Netflix (62%). Implementing a VV program requires attention to privacy, connectivity, and protocols for rescheduling.

WANT 100% SEPSIS BUNDLE COMPLIANCE?

Ali Al-Hilli¹; Michaela Wilsmann¹; Joanna Pluta²; Jonathan A. Schiller¹. ¹Marshfield Medical Center, Marshfield, WI; ²Marshfield Clinic, Marshfield, WI. (Control ID #3171799)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Early recognition and treatment of sepsis continue to be a major local, national and global challenge.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Identify factors that contribute to delays in early recognition and treatment of sepsis 2. Implement interventions to improve compliance with the recommended sepsis care bundle 3. Measure outcomes as percentage of care bundle compliance and mortality

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

Marshfield Medical Center is a 500-bed tertiary hospital in north central Wisconsin. We formed the Sepsis Committee in October 2015, at the time when CMS (Centers for Medicare & Medicaid Services) introduced the new SEP-1 core measure for adult patients with severe sepsis and septic shock. Arguably, this is the most challenging core measure ever introduced by CMS.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We obtained all adult severe sepsis and septic shock diagnoses through our coding and billing departments. We analyzed each patient case for the following metrics: Received within three hours: - Sepsis lactate (will repeat in 3 hrs if >2) - Broad spectrum antibiotic - Blood cultures drawn prior to antibiotics AND if SBP <90 or lactate >4: Initiated within three hours: - Resuscitation with 30 ml/kg crystalloid fluids (may base on ideal body weight [IBW] if morbidly obese and fluids are ordered based on IBW. Documentation must be clear.) AND received within six hours: - Repeat lactate level measurement only if initial lactate level is elevated over 2.0 - Vasopressors for persistent hypotension - MD focused sepsis exam-documented All cases were brought for discussion during our monthly CME-approved meetings. For cases where the core measure was not adhered to, follow up was delegated to the appropriate team member.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The latest national average compliance rate with the SEP-1 core measure was 50%, our running average to date was 77% and our latest audit showed that we have now reached 100% compliance with the SEP-1 core measure.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Excellent sepsis care requires a multidisciplinary and system-based approach to streamline the workflow. We accomplished this by involving the appropriate representatives and leaders in our meetings to help us facilitate the required changes. We automated our laboratory system to order repeat lactate within 3 hours, without any provider having to place a separate order. We created a sepsis order set to guide providers towards meeting all the care bundle components. We invested in a cloud-based software and modified it to serve us as an early warning system, triggering alerts when a combination of parameters is suggestive of sepsis. We provided education via email, Grand Rounds, departmental meetings, resident lectures, posters, and pocket cards. We created online learning modules for different members of the healthcare team to cater to their scope of duties. Furthermore, we ventured beyond the hospital's walls to spread sepsis education. We gave talks to Emergency Medical Crews, we presented at a regional nursing conference and we provided education to all the local nursing home staff.

WELLNESS FOR PRIMARY CARE PROVIDERS: THE IMPACT OF WELLNESS COMMITTEE INTERVENTIONS ON PROVIDER SATISFACTION

Stephanie Duarte¹; Gabi Schiller²; Kira Y. Xie³; Lauren Peccoraro⁴. ¹Mount Sinai Hospital, New York, NY; ²Mount Sinai Health System, New York, NY; ³Icahn School of Medicine at Mount Sinai, New York, NY; ⁴Mount Sinai School of Medicine, New York, NY. (Control ID #3185490)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Burnout rates in primary care providers (PCP) can be as high as 50% which can lead to mental illness, decreased morale, decreased productivity, decreased retention, and lower patient satisfaction and quality of care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To determine if implementing a number of well-being, work flow, and staffing interventions has improved faculty physician (MD) and nurse practitioner (NP) satisfaction and reduced burnout in an urban academic hospital based clinic.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A wellness committee comprised of 7 members convened individually and with leadership on a monthly basis over the course of 4 months to create a pre-intervention survey for the faculty physician and NP providers at an academic primary care clinic. Based on the results of the survey, interventions were created and instituted including hiring 3 administrative assistants, addition of IT equipment to work space, scheduling changes to evenly distribute evening clinic sessions, as well as annual bonus letters and biannual wellness grand rounds. A 1 year follow up survey was administered, mirroring the pre-survey (modified Mini-Z, 16 questions, quantitative and qualitative). The survey responses were compared to assess effectiveness of the implemented interventions.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Primary outcomes are level of provider burnout and satisfaction with current job. Secondary outcomes include sense of control, teamwork, stress, and desire to leave the practice. The quantitative data of the pre- and post-survey was compared using the Chi Squared test (nonparametric). Likert scales were dichotomized for the analysis.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Overall, 28 PCPs responded to the pre-survey (response rate 70%) and 29 PCPs to the post-survey (response rate 73%). Results showed a nonsignificant decrease in provider burnout from 43% to 24%, p = 0.134, after the implemented interventions. There was no change in provider satisfaction with their job. Level of job-related stress significantly decreased after wellness interventions, 64% to 35%, p < 0.05. Meaning in work significantly increased from 37% to 93%, p < 0.001. There also seemed to be a nonsignificant decrease in desire to leave practice and increase in the perceived amount of "time to provide care."

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): While the primary endpoints did not achieve statistical significance, there was a trend toward decreased burnout and significantly decreased job-related stress and increased meaning in work after the interventions. Our practice wellness committee partnered with leadership to implement various measures to promote wellness for providers. The impact assessment is limited by moderate level of participation in survey, as well as survey anonymity preventing paired analysis. Future steps will be to assess the impact of further interventions and a paired analysis, using codes to protect confidentiality.

YOU GET WHAT YOU PAY FOR: AN ANALYSIS OF PAY FOR PERFORMANCE RESULTS IN A LARGE MULTI-SITE ACADEMIC PRIMARY CARE PRACTICE

Benjamin L. Ranard¹; John Anderson^{2, 1}; Kevin Shah^{1, 2}. ¹Duke University School of Medicine, Durham, NC; ²Duke University Health System, Durham, NC. (Control ID #3170979)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Does pay for performance improve statin prescribing by primary care providers (PCPs) for diabetic patients?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To increase guideline-directed medical care of diabetic patients by providing a financial incentive to PCPs.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS):

Duke Primary Care (DPC) is an entity within the Duke University Health System in North Carolina that consists of over 30 clinics in 8 counties, with over 240 PCPs and 730,000 annual patient encounters. DPC has utilized a bundled Diabetes Care metric as a quality incentive for several years. PCPs received a \$2,500 bonus if at least 25% of their diabetic patients met all 5 quality metrics: 1) statin prescription in patients ages 40-75 without statin allergies, 2) HgbA1c < 8%, 3) BP < 140/90 (age 18-59) or <150/90 (age 60-75), 4) non-smoker, and 5) aspirin prescription for patients with 10 year ASCVD risk >10%. The analysis included only PCPs and patients who were present throughout the incentive period of July 2016 - July 2017, PCPs with at least 20 diabetic patients and patients aged 40-75.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): A 10% absolute increase in statin prescriptions without an increase in statin allergies recorded in the medical record.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): There were 134 PCPs and 15,652 patients in the analysis. PCPs varied substantially in prescribing statins and recording statin allergies. Statins were prescribed at baseline by PCPs at a median of 69% (range: 41 - 91%, IQR: 62-75%). Statin allergies at baseline by PCP were median of 6.3% (range: 0-19%, IQR 3.4-8.9%). After the incentive period, there was a 7% relative increase in prescribed statins (550 patients) and a 40% relative increase in statin allergies recorded (455 patients). The median change in statin prescriptions by PCPs was 4% (IQR 0.9 - 7.7%). The median change in statin allergies was 2.2% (IQR 0.78%-3.4%); however, there were four positive outliers (range: 8.8 - 17%). A total of 107 (80%) PCPs had an increase in statin prescription or statin allergies, and 91 (68%) had an increase in both statin prescriptions and statin allergies.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Pay for performance financial incentives impact provider behavior, but it can be challenging to design incentives that improve patient health, fairly compensate providers, and avoid adverse behaviors. In this analysis, there was variation in response to the financial incentive. By allowing PCPs to exclude patients with allergies from their statin prescription metric, providers had two ways to meet the metric - either prescribe a statin or mark a patient as having a statin allergy in the medical record. Providers responded to this incentive by prescribing more statins as well as documenting more statin allergies. While the former was the expected response, the latter may be an undesired outcome with potential negative consequences for patients.

INNOVATION IN MEDICAL EDUCATION (IME)

"ARE YOUR LEARNERS READY TO HOLD THE ADMISSION PAGER?": BUILDING A RESIDENT CURRICULUM FOR TRIAGE AND DISPOSITION DECISION-MAKING - PART 2 AN ASYNCHRONOUS ONLINE COURSE ON HOSPITAL TRIAGE AND SYSTEMS-BASED PRACTICE

David Schmit^{1, 2}; Emily S. Wang^{1, 2}; Sadie Trammell Velasquez^{1, 2}; Sherwin Hsu³; Christopher J. Smith⁴; Tabatha Matthias⁴; Raj Sehgal^{1, 2}. ¹University of Texas Health at San Antonio, San Antonio, TX; ²South Texas Veterans Health

Care System, San Antonio, TX; ³Olive View - UCLA Medical Center, Sylmar, CA; ⁴University of Nebraska Medical Center, Omaha, NE. (Control ID #3184562)

NEEDS AND OBJECTIVES: In the context of Internal Medicine (IM), triage refers to activities related to determining the most appropriate disposition and management plans for patients. When triaging, residents must use effective inter-professional communication, coordinate care in complex healthcare systems, and make appropriate evidence-based decisions. Because of duty hour restrictions, many triaging duties have transitioned from resident learners to faculty thus creating a gap in triage skills and knowledge. In the first part of this project, we developed an e-module on inter-professional communication, which is currently available on the Society of Hospital Medicine's (SHM) online learning portal. The focus of the second part in this series, through a 2017 UT Kenneth Shine Academy Health Science Education small grant, is an asynchronous online course/e-module on systems-based practice (SBP)/healthcare systems. 1. Define triage and the role of an internist as a triagist 2. Demonstrate understanding of how each of the following competencies apply to the triagist role: Inter-professional communication, SBP/healthcare systems, and evidence-based clinical decision making 3. Development of an asynchronous online course for IM resident learners focusing on SBP/healthcare systems

SETTING AND PARTICIPANTS: Through collaboration between 3 academic medical centers, the curriculum on SBP/healthcare systems includes a narrated e-module with closed captioned videos, faculty teaching guide, and pre-/post-knowledge assessments, all of which are freely available through SHM's online learning portal. This curriculum is intended to be utilized by IM residents and facilitated by faculty.

DESCRIPTION: With the lack of a formal curriculum on triaging, our group sought to create an innovative curriculum that IM faculty can easily implement in their home institutions. We identified 3 core competencies of triaging: inter-professional communication, SBP, and evidence-based decision making. This e-module focuses on understanding SBP/healthcare systems with the corresponding teaching guide providing guidance on incorporating the e-module into local curriculums.

EVALUATION: 1. Utilization of the e-module (geographical distribution and number of times accessed) 2. Assess improvement in residents' SBP knowledge through quizzes embedded in the e-module 3. Pre-/post-surveys from resident learners and faculty

DISCUSSION / REFLECTION / LESSONS LEARNED: With the increasing need to deliver healthcare to the right patients at the right time with the right resources, our IM residents need further education and training on triaging to achieve this goal. We hope our e-module will meet the needs of IM residents and faculty. As the project nears completion, our group appreciates the time commitment and dedication required to develop a formal online curriculum and would like to pass our insights to future educators.

ONLINE RESOURCE URL (OPTIONAL): Part 1 on Inter-professional communication: <https://www.shmlearningportal.org/content/teaching-guide-building-resident-curriculum> Part 2 on SBP: Will be available for the 2019 SGIM Annual Meeting

"CHOOSE AND TEACH YOUR OWN ADVENTURE": A RESIDENT-CREATED CASE-BASED APPROACH TO PRIMARY CARE CLERKSHIP DIDACTICS

Josephine Cool¹; Brian Eiss². ¹New York Presbyterian-Weill Cornell, New York, NY; ²Weill Cornell Medicine, New York, NY. (Control ID #3183060)

NEEDS AND OBJECTIVES: The objectives of this project were a. to develop an educational session that filled a curricular gap utilizing an interactive "choose your own adventure" approach, b. to assess baseline and new knowledge in several core gastroenterology/hepatology topics using a small group case-based format and pre- and post-tests, c. to facilitate the development of teaching skills in student learners by asking them to use teach-back to educate their peers and d. to assess whether teach-back peer education improves performance on relevant post-test questions.

SETTING AND PARTICIPANTS: This is a one hour session set in a PBL classroom that recurs each clerkship. The participants are medical students rotating through the primary care clerkship. The facilitators are one resident and one faculty member.

DESCRIPTION: The students first complete a pre-test that covers topics from each case. They are then divided into two groups, each of which works through a different case. Each case uses the online presentation tool "Prezi", and the students are prompted to make decisions that will take the case in different directions. At each branching point, they are prompted to look through guidelines, relevant clinical images and evidence-based links that are embedded within the presentation. Although the order of slides varies based on the students' choices, they will always review all content included. Once the case ends, the facilitator helps each student formulate a take home point to present to the students who worked through the other case. Finally, the students reunite and teach each other, and then complete the post-test. At the end they receive a .pdf document with key information to use as a study guide.

EVALUATION: At the beginning of each session, students take a brief pre-test using NBME examination-style vignette-based questions that reflect gastroenterology/hepatology content. The students take the same test at the end of the session, allowing for a comparison of the effects of more direct learning with peer education. Students evaluate the educational value of this session as part of standard post-clerkship evaluations.

DISCUSSION / REFLECTION / LESSONS LEARNED: Feedback for this new session has been positive; students describe higher engagement through the interactive case portion, and they find the teach-back portion to be the most useful. In this last part the role of the facilitator to help students formulate and refine succinct, high yield teaching points is more important than we expected; their eagerness and engagement during the teach-back session led to time constraints, leading us to create a time script for the session. This project has also allowed us to involve senior internal medicine residents in the design and facilitating of the sessions. In this case, a senior resident was able to create an innovative session, recruit assistant chief residents to help facilitate the sessions, thus fostering collaborative educational efforts and stimulating more interest in medical education career paths for both residents and students.

IMPROVING RESIDENTS SKILLS AND COMFORT LEVEL USING EHR IN OUTPATIENT CONTINUITY CLINIC
Adrianna Wegrecki, Mehrshid Kiazand. UPMC Mercy, Pittsburgh, PA.
(Control ID #3185407)

NEEDS AND OBJECTIVES: The Electronic Health Record (EHR) is an important advancement in health care. However, it may create challenges for trainees. Most residents in our program do not have prior exposure to the specific EHR system used in our continuity clinic (EPIC). A different system is used in the inpatient setting. This adds another learning curve for new interns. Efficiently using EHR in the outpatient setting may be more challenging due to the limited visit time and insufficient training as opposed

to inpatient rotations. This negative experience may be one of the factors determining if a trainee pursues an outpatient medicine career. We designed Supervised Peer Teaching Sessions aimed at helping residents improve their EHR skills.

SETTING AND PARTICIPANTS: Participants were 1st, 2nd and 3rd-year Internal Medicine Residents during their 4-week ambulatory rotation at an academic outpatient clinic.

DESCRIPTION: Medicine residents worked individually or in pairs and presented a specific skill related to EPIC at a weekly didactic session. The topics for presentations were suggested by a faculty champion and reflected the most commonly used features of EPIC needed to efficiently document a visit or update the chart. A pre- and post-session 8-question survey was sent to the residents between January and June 2018. The questions were designed to assess their level of comfort using EPIC in general and its specific functions using a 4-point rating scale. Resident cohort responses were compared using chi-square test.

EVALUATION: The survey was sent to 25 residents and we received 17 pre- and 15 post-rotation responses. The most significant skill improvements were being able to help others with their EPIC questions ($p=0.01$), updating medication list ($p=0.026$) and health maintenance section ($p=0.024$). Skills that were not covered during the didactic sessions did not achieve significant improvement in post-survey, i.e. using Smartphrases ($p=0.75$) or Smartsets ($p=0.065$). Skills that the residents were comfortable with in pre-survey only marginally improved in post-survey, i.e. updating problem lists ($p=0.62$). Comments submitted by residents indicated that most of them appreciated and enjoyed the sessions and felt they were helpful.

DISCUSSION / REFLECTION / LESSONS LEARNED: This Peer Teaching Session offered an effective way to improve medicine residents' comfort level and set of skills needed to efficiently utilize an outpatient EHR. The sessions were brief and enjoyable and did not add much additional burden to the ambulatory rotation. The limitations of this survey were small sample size, misperceptions about own skills in the pre-session survey and short sampling time. Based on this study we implemented this session as a permanent part of the didactic curriculum during the ambulatory rotation and we will continue assess its utility and effectiveness.

REFRAMING THE MEDICAL HISTORY: APPLYING PSYCHIATRY'S FOUR PERSPECTIVES TO THE PRIMARY CARE PATIENT

Patrick Hemming, Duke University School of Medicine, Durham, NC.
(Control ID #3142526)

NEEDS AND OBJECTIVES: The medical history lays the groundwork for all other endeavors of patient care. Current trends in medicine (such as short visit length and the electronic health record) may distract learners from asking about patients' circumstances, priorities and unique needs. To aid learners in individualizing the medical history, the Four Perspectives (Disease, Behavior, Dimensions, Life Story) can be adapted from psychiatric education to offer a unique teaching framework. The goal of this curriculum is that learners will be able to describe and apply all four perspectives in the context of a primary care patient encounter. Such a curriculum will be successful if learners view the information gained as valuable to their patient care and decision-making.

SETTING AND PARTICIPANTS: During the pilot curriculum, each internal medicine resident participated separately in a half-day clinic session with one-on-one precepting. Each resident chose 3-4 patients they identified as having a known or suspected mental health diagnosis and each was

scheduled for a 1-hour appointment. Immediately prior to the session, the preceptor shared a didactic with the resident regarding the Four Perspectives, and prompted the resident to incorporate the Perspectives into each patient visit.

DESCRIPTION: Each perspective covers a different aspect of the patient's history. The Disease Perspective encourages the provider to synthesize objective and subjective information into a physical or mental diagnosis; this Perspective is incomplete without the other three. The Behavior Perspective identifies what actions the patient is taking that impact her disorder; examples include substance abuse and addictions. The Dimensions Perspective challenges the learner to think about the personal characteristics of the patient, and may include health literacy, level of perceived trust, and the provider's own interpersonal chemistry with the patient. Finally, the Life-story Perspective expands the concept of "social history" and asks the learner to gain an understanding of the patients' background.

EVALUATION: Thirteen residents each participated in a session. In post-session surveys, 83 % found that it was useful for their patient, and many commented that they understood their patients better. Only 58 % felt that they had met applied the Perspectives, although in a chart review by the preceptor of their patient notes, 67 % incorporated the Perspectives. Thirty-three percent of residents reported a high positive impact on their patient care skills.

DISCUSSION / REFLECTION / LESSONS LEARNED: Teaching and observing medical history taking is a time-intensive process; importantly, this teaching can allow learners better understanding of their patients. This pilot suggests that learners may benefit from the following: further adaptation of the Four Perspectives for the non-psychiatric general medical setting, and a longitudinal method of instruction.

A CLINICAL LEARNING EXPERIENCE FOR RESIDENTS IN THE MANAGEMENT OF CHRONIC PAIN AND OPIOIDS

Christine Soran¹; Soraya Azari². ¹University of California San Francisco, San Francisco, CA; ²University of California, San Francisco, San Francisco, CA. (Control ID #3187218)

NEEDS AND OBJECTIVES: In the era of the opioid epidemic and tightening regulations on prescribing opioid medications, resident physicians are increasingly uncomfortable with the management of chronic opioid therapy (COT). Additionally, attending practice patterns differ dramatically leaving residents with uncertainty. We sought to create a structured clinical learning experience for primary care residents on a patient-centered approach to the management of chronic pain and opioids.

SETTING AND PARTICIPANTS: HOPE clinic is a multi-disciplinary, once weekly clinic based in an academic primary care clinic based at the county hospital, Zuckerberg San Francisco General (ZSFG). The team includes pharmacy, quality improvement, and physicians with addiction medicine training. The primary care clinic has 24 primary care residents and 23 categorical from the UCSF Internal Medicine residency program.

DESCRIPTION: Primary care residents in their second or third year rotate through the clinic twice per year. Each session has a dedicated curricular topic on chronic pain management. Residents see patients alongside the physician supervisor with the focus of the visit on management of chronic pain and opioids and motivational interviewing communication skills. Additionally, we discuss a plan of care for all resident primary care patients on COT and residents present patients with complex chronic pain or substance use issues. Residents were given a survey to assess confidence with managing pain and COT before and after each clinic session on a 5 point Likert-like scale (1 = not confident through 5 = very confident).

Residents were also asked about stress and enjoyment in working with patients with chronic pain and substance use (1 =completely disagree, 5 = completely agree).

EVALUATION: A total of 14 primary care residents rotated through HOPE clinic one time in the first 6 months of the academic year. Prior to attending HOPE clinic, residents expressed feeling low confidence in the all assessed domains but reported increase in confidence after the session. The change in confidence level was: - conducting a comprehensive pain assessment (average score pre = 2.8 and post = 3.9) - safely prescribing opioids (pre = 2.5 and post = 3.4) - recognizing and managing concerning behaviors in patients on COT (pre= 2.5 and post = 3.5) - creating a treatment plan for chronic pain (pre = 2.8 and post = 3.2) - identifying substance use disorder in patients on COT (pre = 2.1 and post = 3.4) - treating substance use disorders in primary care (pre = 2.3 and post = 3.3) Residents report feeling a great deal of stress working with patients with chronic pain and substance use with slight improvement by one-half point on a Likert scale after the session. All residents agreed they enjoyed the clinical learning experience.

DISCUSSION / REFLECTION / LESSONS LEARNED: Resident physicians face stress and uncertainty when managing chronic pain and opioid therapy. A clinical learning experience with guided mentorship can improve resident confidence and decrease stress when working on these complex issues.

A DIVERSITY CURRICULUM DESIGNED TO FIT A PROVIDER'S BUSY SCHEDULE.

Chirag R. Patel; Marwan Mohammad; Taru Saigal; Mahrous Abo Hassan; Keiko Smith. The Ohio State University Wexner Medical Center, Columbus, OH. (Control ID #3182913)

NEEDS AND OBJECTIVES: In response to feedback received from our hospitalized patients about opportunities for improved cultural and religious sensitivity, we were determined to help our faculty promote and sustain culturally and linguistically appropriate services, and effectively interact with individuals from diverse backgrounds. The purpose of this project was to improve provider cultural competency.

SETTING AND PARTICIPANTS: Setting: Large, tertiary care, academic medical center. Participants: Hospital Medicine physician faculty

DESCRIPTION: As the U.S. population becomes more diverse, Hospital staff need to be better educated to care for patients of varying cultural and social backgrounds. More than half of all U.S. babies born today are people of color, and by 2050 our nation will have no clear racial or ethnic majority¹. As such, the authors created and enacted a diversity curriculum within the division of hospital medicine designed to educate faculty and help minimize cultural barriers that may exist between them and the diverse patient population they serve.

EVALUATION: Using a questionnaire, a baseline assessment was conducted of staff's perception of their cultural competency. The findings validated the authors' hypothesis that a diversity curriculum was needed. The curriculum was developed and involved a multifaceted and asynchronous approach. A monthly lecture series was created with each one dedicated to improving provider familiarity and knowledge of frequently encountered ethnic, religious, cultural, sexual orientation and gender identity groups from our community. Additionally, monthly newsletters which highlighted and provided background on numerous cultural holidays and religious observances were circulated via email and posted in staff work rooms. All staff who attended a lecture were surveyed monthly to obtain a longitudinal assessment of their knowledge and comfort level taking care of culturally diverse patients.

DISCUSSION / REFLECTION / LESSONS LEARNED: Prior to implementation of the diversity curriculum, the average physician self-assessment scores for "knowledge about cultural issues" and "comfort level in taking care of patients from diverse background" were 1.5 and 2 respectively on a 0-5 rating scale with 5 being the highest score. Over the course of nine months, 190 survey responses were received. Within six months of curriculum implementation, the average scores had increased to 4.5 out of 5 for both "knowledge" and "comfort". The subsequent three months demonstrated sustained high scoring. Based on the results, the diversity curriculum was felt to be highly impactful and successful in improving staff confidence in caring for a diverse patient population. As the curriculum progresses and evolves, we will be measuring if improved provider comfort and knowledge levels will have a downstream impact on care quality and health disparities.

A FOCUS ON INTERPROFESSIONAL TEAMS: HIGHLIGHTING THE NURSING ROLE IN RESIDENT EDUCATION

Jennifer Ohtola¹; Dianna Copley¹; Kimberly Kalo¹; Jessica Donato². ¹Cleveland Clinic, Cleveland, OH; ²Cleveland Clinic, Beachwood, OH. (Control ID #3185818)

NEEDS AND OBJECTIVES: Success in systems based practice includes knowledge of the interprofessional team, the roles of each member and qualities of effective teams. Internal medicine trainees frequently work within interprofessional teams in multiple clinical environments but rarely receive formal education on the scope of practice and tasks of their nursing colleagues. We sought to develop a didactic session focused on knowledge delivery related to nursing scope of practice and attitudinal change related to communication and mutual respect between residents and nursing.

SETTING AND PARTICIPANTS: A one-hour didactic session was implemented at our large internal medicine training program with 43 residents in attendance (12 PGY3, 15 PGY2, 16 PGY1). The session was led by a PGY2 medicine resident and a group of five med-surg nursing staff.

DESCRIPTION: The session started with a resident-led discussion of interprofessional team structure and features of effective teams, followed by a nursing-led review of nursing education and orientation, workflow and tasks, and effective communication strategies. This included discussion of patient assignments, medication passes, nursing management of physician orders, and paging standards. A nursing assistant (NA) reviewed the scope of practice, tasks and training for NAs. The session concluded with a review of "what we wish residents knew" for both nurses and NAs. This was followed by time allotted for audience questions to the panel of 4 nurses and a NA. Residents were provided with a handout highlighting electronic medical record (EMR) communication pitfalls and orders to optimize effective communication with nurses regarding medications, lines, and drains.

EVALUATION: Residents completed pre- and post-session surveys assessing knowledge of nursing and NA scope of practice and attitude related to communication with nursing with a 1-4 point Likert scale (1 = strongly disagree, 4 = strongly agree). Thirty pre-session and 27 post-session surveys were completed. The average level of trainee-reported knowledge of scope of practice for nurses and NAs improved from 2.6 to 3.3 and 2.4 to 3.3, respectively. Knowledge of EMR orders for communication improved from 2.7 to 3.4, and knowledge of differences between EMR layouts of physicians and nurses improved from 2 to 3.1. Self-reported comfort with communication style with nursing improved from 3 to 3.3. The mean rating of the session was 3.6, with 1 being poor and 4 being excellent.

DISCUSSION / REFLECTION / LESSONS LEARNED: We describe a novel interprofessional educational session focused on enhancing trainee knowledge of nursing scope of practice and improving trainee-nursing

relationships and communication. We showed an improvement in trainee-reported knowledge of nursing practice and attitude regarding communication with nursing. We also showed an increase in trainee knowledge of EMR orders available for communication and differences in EMR functionality between physicians and nurses. The session was well-received and well-rated.

A HEALTH EQUITY AND DISPARITIES CURRICULUM WHICH DOES NOT REDACT HISTORICAL AND POLITICAL ROOTS

Yalda Shahram, UCSF, San Francisco, CA. (Control ID #3176650)

NEEDS AND OBJECTIVES: Treating all patients equally does not eliminate health disparities; providers ignoring their own cultural background and biases when delivering health care to patients does not eliminate health disparities; equal access to health care does not eliminate health disparities; these and other misconceptions exist among health care providers. We present an innovative curriculum to address the key gap in current health equity and disparities curricula: the avoidance of historical and political roots of inequity. Our objectives are to break misconceptions about health disparities and to provide tools for practicing equitable care.

SETTING AND PARTICIPANTS: 24 participants ranging in specialty from anesthesia to radiology, from 2 years of practice to over 20. Attending physicians have a choice when selecting half-day workshops for faculty development and all participants had selected this seminar.

DESCRIPTION: It is inadequate to discuss poverty without oppression, race without racism, income inequality without capitalism, gender inequality without sexism... Avoidance of the roots contributing to inequity in health care presents to the learner a redacted curriculum that will always lead to a perpetuation of inequity, only with the new guise of awareness. This curriculum about health equity and disparities is presented in an interactive style including polling, small group discussions, case reviews and presentations, and debriefing activities. The curriculum content is presented in Table 1.

EVALUATION: Post-intervention survey showed participants ranking their understanding of health disparities from average/good to good/great. True/False statements in the survey were used to demonstrate misconceptions, for example, "the Tuskegee experiments were conducted to treat adult African Americans suffering from syphilis" showed 66.7% correct pre-seminar compared to 100% post-seminar. Confidence was also measured after each statement in the survey and for the example given, confidence increased from 4.2 to 4.9 on a 5-point scale.

DISCUSSION / REFLECTION / LESSONS LEARNED: Addressing health care disparities begins with awareness. In this curriculum, interactive learning by small group discussions is the primary mode of distributing the knowledge about the historical and political roots of inequities. The topics covered can elicit an emotional response from participants and it is imperative that a safe space is established prior to opening discussions of sensitive topics, such as privilege or bias. Limiting the number of participants to 24 and having small group activities helped to establish a safe space. After an awareness is reached, action is practiced by the method of unlearning. Participants are introduced to the method of unlearning and encouraged to continue practicing using this tool.

ONLINE RESOURCE URL (OPTIONAL): Table 1: <https://docs.google.com/document/d/1HHnIusk2CuRpY5jBO6C2F9zYUizBnGSjyADOVPqENZM/edit?usp=sharing>

A HOTSPOTTING CURRICULUM TO ENHANCE EDUCATION ON COMPLEX AMBULATORY PATIENT CARE

Zehra Hussain; Michaela Seigo; Tabassum Salam; Gretchen Rickards. Christiana Care Health System, Wilmington, DE. (Control ID #3181816)

NEEDS AND OBJECTIVES: A small number of individuals with complex health and social needs drive much of the total cost of care in the US health system today. This group of patients, referred to as "high-utilizers," often receive fragmented care that poorly addresses their chronic physical and psychosocial issues. Healthcare hotspotting involves the strategic use of data to identify high-utilizer patients, understand their underlying issues, allocate resources, and design interventions to tailor care. We introduced a novel hotspotting curriculum to enhance population health training in our ambulatory resident clinic.

SETTING AND PARTICIPANTS: Wilmington Adult Medicine is an urban primary care resident clinic. Thirty-six residents in our categorical internal medicine program participated in this curriculum.

DESCRIPTION: Using data from our accountable care organization (ACO) as well as ER utilization reports, each resident was matched with a high-utilizer patient on their continuity panel. At the beginning of the academic year, a didactic session was presented that introduced basic concepts of population health management and high-value care. Each resident was then provided the name of the high-utilizer patient he/she had been assigned to follow for the year. The primary tasks were to review chart and cost of care data for the patient, to identify barriers to the patient's care, and to design and implement interventions to address the patient's unique needs. The final deliverable was a structured written reflection about the exercise.

EVALUATION: Data included the residents' reflections as well as pre- and post-intervention patient cost data from our ACO database. Twenty-two of the 36 residents (61% of participants) submitted reflection papers. Three primary themes emerged from the reflections: (1) social determinants are key; (2) early intervention is critical; and (3) resources exist to help. With regard to ACO cost data, 12 of the 36 patients were excluded from the analysis due to missing data. The mean annual pre-intervention cost per patient was \$20,111.54 (range \$6.87-\$117,937.49) and the mean post-intervention cost for the same group was \$23,121.65 (range \$363.61-\$177,544.74; p=0.78).

DISCUSSION / REFLECTION / LESSONS LEARNED: Through this curriculum, residents applied hotspotting techniques to address the health of our clinic's sickest and most vulnerable patients. Although we did not achieve cost reduction, our hope is that the exercise resulted in a deeper understanding of the costs of care, the social determinants of health, and the value of interprofessional and community resources in complex care. The curriculum was well received by residents, who described greater confidence in caring for their most medically and socially challenging patients post-intervention.

A LONGITUDINAL RESILIENCE CURRICULUM FOR MEDICAL STUDENTS DURING CLERKSHIPS

Jennifer Houpy¹; Sonia P. Oyola¹; Amber-Nicole Bird²; Oana Tomescu²; Amber Pincavage¹. ¹University of Chicago, Chicago, IL; ²University of Pennsylvania, Philadelphia, PA. (Control ID #3186319)

NEEDS AND OBJECTIVES: Fostering resilience is a promising way to mitigate negative effects of difficult experiences and prevent burnout. In our needs assessment of third year medical students, mean resilience was lower than in a general population sample but higher in students who felt able to cope with difficult clinical events and who felt comfortable discussing stress and burnout with peers. We aimed to create a curriculum to help cultivate resilience in medical students during their clerkship year.

SETTING AND PARTICIPANTS: Our curriculum included three skill-building workshops interspersed during the clerkship year of seventy-four third year medical students at the University of Chicago.

DESCRIPTION: Three skill-building workshops focused on difficult team interactions, challenging patient interactions, and disappointments and

setbacks. These themes were frequently identified clinical stressors based on our needs assessment. Each session encouraged students to engage in facilitated reflection on their personal experiences with the topic and theoretical cases. Cases were based upon experiences from prior clerkship reflection sessions. After group discussion, skill-building exercises were introduced and used to stimulate further discussion.

EVALUATION: The curriculum was assessed based upon surveys of student satisfaction and Connor Davidson Resilience Scales (CD-RISC 10, range 0-40), as well as focus groups. Seventy-four medical students were surveyed at the end of their third year with a 72% response rate (53/74). Compared to third year students in 2016 at the end of the third year prior to the implementation of the curriculum (n=57), the post curriculum students' CD-RISC 10 resilience scores improved (pre-mean 26.91±6.47 vs. post-mean 29.59±5.33; p=0.019). More than half of students agreed or strongly agreed that the sessions had been an open forum for reflection (55%, 29/53) and allowed them to connect with peers (51%, 27/53). Fifty-one percent (27/53) thought having time to discuss these topics was valuable. Themes in students' written comments and focus groups included connecting with peers and feeling less alone. Some students commented holding sessions with clerkship directors present was not ideal for them, and others felt they had other outlets for these discussions and sessions were not necessary. Many students appreciated that attention was paid to their wellness during clerkships.

DISCUSSION / REFLECTION / LESSONS LEARNED: This curriculum targeted clinical stressors highlighted by medical students as a springboard to teach resilience skills. A challenge was constructing a setting conducive to comfortable reflection for all learners, and not all students found these sessions necessary. The curriculum was valuable for half of students, and it is possible resilience was improved.

A MEDICINE CLERKSHIP CURRICULUM TO PROMOTE PATIENT ADVOCACY

Nancy Choi; Sneha S. Daya; Cindy Lai. UCSF, San Francisco, CA. (Control ID #3166711)

NEEDS AND OBJECTIVES: Patient advocacy is taught in the pre-clinical medical school years as a core concept of the medical profession, yet clerkship students are rarely taught practical skills on how to translate this concept to direct patient care. We developed an advocacy curriculum teaching students to: 1) elicit how social determinants of health (SDOH) impact care of patients, 2) develop concrete skills to reduce healthcare barriers, and 3) reflect and debrief on their advocacy experience.

SETTING AND PARTICIPANTS: During the six blocks of the academic year (January-December 2018), internal medicine clerkship students (n=66) at a large, urban academic medical center were required to participate.

DESCRIPTION: The curriculum consisted of four components spanning a two-month clerkship: 1) Faculty-facilitated, interactive workshop that included the following: "Advocacy Toolkit" (handout summarizing practical tools and resources); case studies on how to apply advocacy skills during hospitalization and transitions of care; "best practices" discussion with a social worker (SW) and case manager (CM); and time to practice how to discuss advocacy concepts in team rounds. Students utilized these to practice their advocacy skills during their clerkship, and there was concurrent faculty development in this. 2) Post-discharge patient phone call to assess success of the discharge transition. 3) Written and oral reflection to medical team discussing patient advocacy. 4) Debriefing workshop at the end, discussing strategies to continue advocacy.

EVALUATION: Students (n=66) completed surveys pre- and post-curriculum regarding advocacy. Pre-curriculum, 87% of students agreed that

advocacy education in clerkships was important to their professional development, yet only 26% agreed that they had received formal education on this. Pre-curriculum, 35% of students agreed that they felt confident in their skills to advocate for patients in the inpatient setting; this increased to 100% post-curriculum. 93% of students agreed this curriculum helped them work closely with patients to ensure they received equitable care. Qualitative comments about what students mostly valued included themes related to advocacy education (e.g., "The ability to teach all of us that these are tangible factors that can radically change one's outcome when d'd from the hospital") and the SW/CM interactive components of this curriculum.

DISCUSSION / REFLECTION / LESSONS LEARNED: We hope to prepare all students to advocate for better patient health outcomes and health equity. Our survey results indicate our curriculum improved students' confidence and skills in patient advocacy topics. Their assignment and debriefing sessions allowed critical time for meaningful reflection. Student feedback has been critical to the evolution of the curriculum. Faculty development surrounding patient advocacy education has been instrumental in the implementation of this project, and we encourage other institutions to incorporate patient advocacy skills education into their clerkship curricula.

A MULTIFACETED APPROACH TO INCREASE TRAINEE SCHOLARLY ACTIVITY

Shradha A. Kulkarni, Baylor College of Medicine, Houston, TX. (Control ID #3187004)

NEEDS AND OBJECTIVES: Due to the clinical rigors of residency, time to pursue extracurricular scholarly activity can be limited for residents. Additionally, mentorship and support for research endeavors is also variable among residency programs. At Baylor College of Medicine (BCM), the Accreditation Council for Graduate Medical Education (ACGME) annual program evaluation survey identified scholarly activity as an area in which to potentially improve. To directly address this need, a task force was created and developed the following multifaceted innovation.

SETTING AND PARTICIPANTS: This innovation involved medical students on the internal medicine core clerkship and residents in the internal medicine residency program at Baylor College of Medicine, and took place as an after-hours, voluntary session on campus.

DESCRIPTION: First, to increase awareness regarding opportunities for scholarly activity, an extensive list of local, regional, and national academic conferences was compiled and distributed to all residents and medical students. The list was organized by specialty and included submission deadlines, conference locations, and dates. Next, a workshop was held in which faculty members provided general tips and suggestions for writing an abstract to submit to a conference. The final portion of this innovation was the poster workshop, which was held three times during the year. The workshop began with a brief introduction with tips for creating effective poster and oral presentations. Subsequently, medical students and residents practiced presenting rough drafts of their posters to a mock judging panel comprised of faculty members, several of whom have served on abstract review committees or judging panels for conferences.

EVALUATION: The number of abstract submissions and acceptances to academic conferences were tracked before and after the innovation was created.

DISCUSSION / REFLECTION / LESSONS LEARNED: After the above interventions began in 2017, abstract submissions and acceptances to academic conferences have increased. For the Texas chapter of the American College of Physicians annual meeting (TxACP), the total number of posters/oral presentations by students and residents in 2015 and 2016 were 15 and 19,

respectively. After development of this innovation, the number increased in 2017 and 2018 to 25 and 26, respectively. This innovation has both increased awareness and scholarly activity output by 50% by trainees at BCM. The most striking impact has been on medical students, as the number of student presentations at TxACP has increased over 300% from 6 in 2015 to 20 in 2018. Residents played an integral role as most student presentations included at least one resident as a co-author.

A NOVEL CONTRACEPTION COUNSELING AND SHARED DECISION MAKING CURRICULUM: IMPACT ON RESIDENT KNOWLEDGE AND ATTITUDES

Rebeca Ortiz Worthington¹; Amber Pincavage¹; Julie Oyler²; Jen Rusiecki¹.

¹University of Chicago, Chicago, IL; ²University of Chicago Medical Center, Chicago, IL. (Control ID #3185024)

NEEDS AND OBJECTIVES: After completion of this curriculum residents will be able to: 1. Discuss a patient's reproductive goals. 2. Engage a patient in a Shared Decision Making (SDM) conversation including counsel a patient on contraception options including discussing efficacy. 3. Identify contraindication and common side effects of these options. 4. Explore a patient's values and concerns surrounding contraception.

SETTING AND PARTICIPANTS: IM and Med/Peds PGY-2-4 residents at a single institution participated in the curriculum. This included a 1-hour large group, interactive teaching session with the use of an original educational video. The initial needs assessment was distributed a year prior to the curriculum and the post survey was performed immediately following the curriculum. Clinical faculty preceptors were also included in the initial needs assessment.

DESCRIPTION: The 2014 CDC guideline states that PCPs should provide contraceptive counseling (CC) and prescribe the selected method. IM and Med/Peds physicians are responsible for providing care to medically complex women of reproductive age, yet past studies have shown that inadequate knowledge is a barrier to CC. The CHOICE study demonstrated an increase in long-acting reversible contraception (LARC) prescribing with a CC interventions highlighting that counseling is an important factor in reproductive planning. SDM is a method of patient-centered communication that has been shown to promote contraception adherence. We initiated an innovative curriculum to teach residents CC through the framework of SDM.

EVALUATION: 38 pre and 58 post-curriculum residents (48% and 73%) completed surveys. Residents reported improvement in comfort with CC overall (mean pre- 3.21, post- 3.58, p<0.001, scale 1="I need close supervision", and 5="I can teach this skill"). The greatest improvements were seen in comfort discussing efficacy, patient beliefs and negotiating a decision. 66% reported comfort with counseling on Nexplanon after the curriculum (37% pre). Gains were seen in most of the questions focused on medical knowledge (IUDs and PID, 95% correct post versus 59% pre). Residents found the video to be a helpful tool (90% felt the video helped with discussing contraception options). Residents and faculty both under recognized teratogenic risk (13% faculty and 11% residents correctly identify teratogens unchanged with curriculum). The faculty survey revealed a gap in contraceptive knowledge and comfort with teaching these topics. 22% felt they had not received adequate training. Only 17% of faculty reported comfort teaching this skillset. Though 78% of faculty feel it is very important that residents learn about contraception.

DISCUSSION / REFLECTION / LESSONS LEARNED: Prior to this curriculum, residents felt that CC was important, but lacked knowledge and training. This curriculum successfully addresses gaps in comfort and knowledge with CC including the use of LARC. Residents feel that the video

component of the curriculum was beneficial. Future iterations of the curriculum will need to highlight teratogenic risk.

A NOVEL UNIVERSITY-WIDE PATIENT-CENTERED INTERPROFESSIONAL 1ST YEAR CURRICULUM

Christopher Bruti¹; Jan Odiaga²; Joanne M. Miller²; Gabriella Cs-Szabo²; Mary Jo Guglielmo²; Steven Taylor²; Theresa Gierlowski². ¹Rush University Medical Center, Chicago, IL; ²Rush University, Chicago, IL. (Control ID #3181212)

NEEDS AND OBJECTIVES: Highly effective patient-centered interprofessional health care teams are one of the best ways to meet the IHI's proposed quadruple aim of healthcare (improved care, population health, cost effectiveness, and joy of work). Rush University created a novel 1st year University-wide Interprofessional Patient-Centered (IPPC) curriculum to give students the foundation needed to lead and succeed in this environment.

SETTING AND PARTICIPANTS: Rush inaugurated the IPPC curriculum in the 2016-17 academic year with 376 students from 11 degree programs. Based on feedback from students and faculty, the course was redesigned and expanded in 2017-18 to include 698 students from 18 different academic programs including another university. The course involves 6 live team-based experiential workshops with online pre-course work over an academic year. Students stay in the same interprofessional team with at least 4 different professionals. The course is pass/fail with the expectation of spending approximately 20 hours of work over the year.

DESCRIPTION: The course objectives are for students to acquire the 4 Interprofessional Education Collaborative (IPEC) competencies (roles/responsibilities, interprofessional-communication, teams/teamwork, values/ethics) utilizing a patient-centered approach. Highlights of the workshops include the Community Health Mentor (CHM) where teams work with a community member with a chronic disease. They learn from their CHM about living with a chronic disease, work with them to create a health care goal, and learn about their community. They are tasked with following the CHM longitudinally and creating a community advocacy proposal to improve the CHM's community's health outcomes. Team skills are evaluated at the end of the course through a Team Objective Structured Clinical Exam (TOSCE), where the student teams work with and counsel a standardized patient about a health problem.

EVALUATION: Quantitative and qualitative data were obtained following each workshop. Students developed competency in all four IPEC domains. They valued the interprofessional team approach to their health mentor, assessing health situations and providing whole-person care.

DISCUSSION / REFLECTION / LESSONS LEARNED: Implementation of an IPE curriculum spanning 2 universities, 5 colleges, 18 programs, and 698 students was full of challenges and lessons learned. Most important to the success of the curriculum was building an interprofessional leadership team. This team continued to meet weekly for the past 4 years to build support, design and iterate the curriculum, and to resolve logistical issues. The first version of the curriculum could not maintain team consistency due to scheduling conflicts and thus relied on online team-based modules, which were poorly received and ineffective. This was overcome by implementation of a university common calendar with Wednesday afternoons reserved for IPE. Since IPE successfully aligned with the

mission, vision, and strategy of Rush, the program gained high-level attention and financial support.

A PILOT CLUSTER RANDOMIZED, CONTROLLED TRIAL OF A CLERKSHIP-BASED VISUAL ARTS CURRICULUM TO COMBAT BIAS AND PROMOTE WELL-BEING

Stephanie J. Hoffman¹; Garth W. Strohbehn^{2, 1}; Molly Tokaz¹; Ruth Slavin^{3, 4}; Suzanne Winter¹; Martha Quinn¹; David Ratz⁵; Sanjay Saint^{6, 2}; Vineet Chopra^{1, 2}; Nathan Houchens^{2, 1}; Joel Howell^{7, 4}. ¹University of Michigan, Ann Arbor, MI; ²Veterans Affairs Medical Center, Ann Arbor, MI; ³University of Michigan Museum of Art, Ann Arbor, MI; ⁴Medical Arts Program, Ann Arbor, MI; ⁵Veterans Affairs, Ann Arbor, MI; ⁶University of Michigan Health System, Ann Arbor, MI; ⁷U Michigan, Ann Arbor, MI. (Control ID #3138376)

NEEDS AND OBJECTIVES: Retrospective analyses have shown associations between arts exposure and protective personality traits (e.g., empathy, tolerance of ambiguity), suggesting that facilitating arts exposure may help learners gain these traits. Unfortunately, most visual arts-based curricular interventions lack rigorous assessment and are rarely performed in the clinical setting. We conducted a pilot randomized, controlled trial to assess impacts of incorporating a visual arts curriculum into a clinical clerkship.

SETTING AND PARTICIPANTS: Study participants were University of Michigan (UM) medical students on VA Ann Arbor Healthcare System (VA) inpatient internal medicine teams. Museum arts (MA) interventions occurred at the UM Museum of Art whereas hospital arts (HA) interventions and case-based conferences (CBC) were at the VA.

DESCRIPTION: After participants provided written informed consent and completed a baseline survey, we randomized teams to three weekly one-hour sessions: MA (n = 14), HA (n = 14), or CBC (n = 15). Developed by an expert arts educator, MA and HA used active, guided discussion of artwork to explore themes of compassion, suffering, and ambiguity. The HA curriculum was identical to MA except for the use of digital representations of artwork and facilitation by non-experts. CBC served as contact time and environmental control arm.

EVALUATION: Psychometric surveys were repeated after curriculum completion, using validated scales of empathy, mindfulness, tolerance of ambiguity, and grit. We also compared NBME shelf exam performance. No statistically significant results were identified within quantitative outcome measures, including shelf exam performance between the arms. Focus groups with formal qualitative analysis, however, suggested that the arts curriculum provided a fulfilling escape from clinical medicine, increased cognizance of implicit bias, and promoted differentiation between observation and interpretation.

DISCUSSION / REFLECTION / LESSONS LEARNED: In our pilot study, students were willing to participate in art-based interventions while on clinical duties. No statistically significant quantitative results emerged, but absence of difference in NBME shelf exam scores was reassuring. Focus group discussions identified benefits of the arts intervention not otherwise captured by quantitative measures. Despite being shelf exam neutral, students felt stress while away from clinical duties. Study strengths include randomization of an unbiased study sample and use of outcome

measures relevant to curricular stakeholders. Inclusion of the HA group also supports the feasibility of implementing arts interventions at other centers.

A PILOT OFFICE-BASED OPIOID TREATMENT CLINIC IN AN INTERNAL MEDICINE RESIDENT CONTINUITY PRACTICE: PROVIDER, STAFF, AND PATIENT OUTCOMES.

Jarratt Pytell¹; Michael Brady¹; Megan Buresh^{1, 2}; Ryan Graddy¹. ¹Johns Hopkins Bayview Medical Center, Baltimore, MD; ²Johns Hopkins Bloomberg School of Public Health, Baltimore, MD. (Control ID #3182464)

NEEDS AND OBJECTIVES: The integration of substance use disorder (SUD) care and competencies in graduate medical education training is needed. Previous research shows improvements in provider knowledge, attitudes, and practices after exposure to SUD care. Few studies report outcomes for patients with SUD in resident physician continuity practices. We describe a pilot integrating office-based opioid treatment (OBOT) with buprenorphine in an internal medicine resident continuity practice. We report survey results of resident and staff knowledge and attitudes of OBOT and patient outcomes.

SETTING AND PARTICIPANTS: We surveyed all internal medicine residents (N=48) and staff (N=22). A retrospective chart review was completed for all patients seen (N=12).

DESCRIPTION: The OBOT clinic operated within the GIM practice for 1.5 hours weekly during a clinic session and was staffed by 2 attendings and 3 residents with prior OBOT experience who alternated coverage. Two support staff coordinated appointments and collect urine toxicology screens. Patients with opioid use disorder (OUD) were identified by their primary care provider, referred to the OBOT clinic, and an individualized treatment plan was created. All care, including buprenorphine prescriptions and counseling, was provided by the residents and attendings. Surveys of provider and staff knowledge and attitudes of OBOT were administered at baseline and 4 months into the pilot. We analyzed survey results using Fisher's exact test. A retrospective chart review of the first 15-months obtained patient characteristics and treatment outcomes including retention and measured good clinical response. A good clinical response was defined as being illicit opioid negative and buprenorphine positive for >50% of time in treatment.

EVALUATION: Survey response rates were 83% for residents and 100% for staff. No statistically significant differences were observed for any survey item between baseline and 4 months. Most residents (87%) reported caring for patients with OUD, yet only 27% felt comfortable providing care and 30% believed OBOT was ineffective without on-site drug counseling. Among staff, 53% felt primary care practices were inappropriate places to treat OUD. Results from the retrospective chart review showed the average age was 55 years (range 30-78 years) and all patients were white. Most patients were male (75%) and referred from residents (75%). Seven patients (58%) were retained in care at the end of the study period (range of 9-15 months); 8 patients (75%) demonstrated a good clinical response. Of those not retained, 3 patients transferred, 1 self-tapered, and 1 was lost to follow up.

DISCUSSION / REFLECTION / LESSONS LEARNED: OBOT can be successfully integrated into existing resident continuity practices utilizing existing staff and resources with positive patient outcomes. We did not observe changes towards acceptance in provider and staff attitudes of OBOT likely due to the small scope of the OBOT pilot clinic. It is possible that more direct and frequent exposure to OUD care would lead to increased acceptance.

A PILOT USAGE OF POSITIVE DEVIANCE TO ENHANCE TEACHING OF THE 3RD-YEAR-INTERNAL MEDICINE CLERKSHIP

Ali S. Jahansooz. KUSM-W, Wichita, KS. (Control ID #3181522)

NEEDS AND OBJECTIVES: To enhance the quality of teaching on our 3rd Year Internal Medicine clerkship, we designed a positive-deviance (PD) intervention to identify unique teaching tactics used by our most effective faculty teachers and disseminate their unique tactics to the remaining faculty.

SETTING AND PARTICIPANTS: Area hospitals Academic hospitalists

DESCRIPTION: Modeled after Google's Project Oxygen, we identified the hospitalist faculty rated the highest for "overall effectiveness" using the end-of-3rd-year faculty evaluations. We surveyed our hospitalist faculty to query the teaching tactics they perceive are effective or unique. We created a Table of Tactics with one row listing tactics reported by our positive deviance and the other row listing tactics by other faculty members. We created a faculty development session that used the Table of Tactics to prompt a discussion of the most effective teaching strategies identified by our positive deviants. The Faculty was given recommendations excerpted from Palmer and Blake on creating a safe learning environment for successful peer learning.

EVALUATION: 80% (12/15) of hospitalist faculty responded to the survey of tactics and all positive deviants responded to the survey. Some of the responses, including from PDs, were general and did not offer specific tactics. 75% (3/4) positive deviants considered creating a safe learning environment most effective while 3 of 7 non-deviants considered safe learning environment most effective; thus, the development session focused on this discussing implementation of this tactic. We received 5 post-session surveys with four positive responses.

DISCUSSION / REFLECTION / LESSONS LEARNED: Most faculty members received the PD intervention positively. Lessons learned from this pilot are 1) use a plot of faculty assessments by students overlaying a binomial distribution to improve selecting the PDs 2) improve our survey of tactics by priming the faculty with a framework of teaching tactics from the literature, but not stating best practices within the framework in order to encourage honest reporting by the faculty, 3) improve our introduction of the session to reduce threat and perception of criticism of non-deviants, 4) expand comments in the discussion by creating ad hoc scenarios for role play.

ONLINE RESOURCE URL (OPTIONAL): N/A

A RESIDENT-CENTERED WELLNESS CURRICULUM

Amanda Ray¹; Yukiko Kunitomo¹; Brita Roy²; Katherine A. Gielissen¹.

¹Yale-New Haven Hospital, New Haven, CT; ²Yale University School of Medicine, New Haven, CT. (Control ID #3186061)

NEEDS AND OBJECTIVES: Studies show high burnout rates among medical residents. Many US programs have developed interventions to minimize burnout but most only target interns despite evidence of high levels of burnout among upper-level residents. Nearly all curricula are led by faculty or Chief Residents, however, a preliminary survey of internal medicine (IM) residents at Yale New Haven Hospital (YNHH) revealed that many residents find the presence of faculty or chiefs detracts from effective and open exploration of burnout and wellness. We describe a resident-designed, resident-led wellness curriculum for IM trainees of all levels.

SETTING AND PARTICIPANTS: The curriculum was implemented in the 2018-2019 academic year's ambulatory didactics provided for YNHH's Traditional IM residents, occurring on a rotating basis throughout the year.

DESCRIPTION: After performing a survey-based needs assessment of residents, we developed six, hour-long sessions covering topics on burnout, wellness, and resilience. Each session includes 1) introductory exercises, 2) open discussion, and 3) teaching of specific coping tools. Designated resident "Wellness Leaders" (peer-elected upper-level residents) facilitate the sessions.

EVALUATION: We collected resident baseline scores of burnout, wellbeing, and self-efficacy in Spring 2018 using the Oldenburg Inventory (OBI), Short Flourishing Scale (SFS), and General Self-Efficacy Scale (GSE), respectively. Residents will complete a post-intervention survey in Spring 2019. All residents receive post-session surveys utilizing Likert scales and narrative comments to obtain feedback on curriculum content and format and to evaluate the subjective usefulness of the sessions and their activities.

DISCUSSION / REFLECTION / LESSONS LEARNED: At baseline, 77% scored high on the OBI overall (n=62) with 90% and 63% scoring high on the exhaustion and disengagement subscales, respectively. 33% scored low-to-moderate (<45) on the SFS (n=59), and 17% scored low-to-moderate (<30) on the GSE (n=59). Although we await post-intervention data to quantify curriculum impacts on these indices, 85% of respondents on average report leaving sessions with increased coping tools (n=72). Common themes from feedback surveys include the benefits of having space to discover shared experiences across all years and learning specific coping strategies from peers for the demands of residency. Challenges raised are how to keep sessions relevant to third-year residents and the difficulty of sharing personal challenges in a group setting.

A ROBUST FACULTY DEVELOPMENT PROGRAM FOR MEDICAL EDUCATORS: A DECADE OF EXPERIENCE

Sarah B. Merriam^{1, 2}; Rachel Vanderberg³; Melissa McNeil¹; Tanya Nikiforova⁴; Carla Spagnolletti⁵. ¹University of Pittsburgh Medical Center, Pittsburgh, PA; ²VA Pittsburgh Healthcare System, Pittsburgh, PA; ³UPMC, Pittsburgh, PA; ⁴University Of Pittsburgh Medical Center, Pittsburgh, PA; ⁵University of Pittsburgh, Pittsburgh, PA. (Control ID #3185591)

NEEDS AND OBJECTIVES: Faculty development programs (FDPs) foster learning communities and enhance professional identity formation for medical educators. Recent work has highlighted the need to consider competency-based frameworks when designing FDPs, to both identify deficiencies in existing curricula and to drive skill development across clinical practice, teaching, and scholarship domains. We aim to outline the components of a novel FDP in the context of established medical educator competencies, describe its outcomes to date, and identify steps for implementation and sustainment of similar programming.

SETTING AND PARTICIPANTS: The FDP consists of 4 one-hour-long conferences held weekly since 2007 at the University of Pittsburgh SOM, open to all health sciences faculty, fellows, and others interested in medical education. Evaluation data is available for faculty attendees and presenters in four consecutive academic years from 2014 to 2018.

DESCRIPTION: The overarching goal of the FDP is to support the advancement of educator faculty, promote curricular innovation and teaching excellence, enhance educational scholarship, and cultivate a community of educators. The FDP includes four rotating conferences: Academy of Master Educators Seminar Series, Medical Education Research Conference, Medical Education Journal Club, and Medical Education Research Methods and Innovative Design Conference.

EVALUATION: We outlined the relationship of these FDP conferences to established medical educator competencies by consensus. We also

evaluated 1) presenter and attendee rank and department, 2) average conference attendance over 4 academic years (2014-2018) and 3) impact of this program on faculty presenters.

DISCUSSION / REFLECTION / LESSONS LEARNED: Collectively, this well-attended (average # of attendees per conference = 20) internally-driven FDP meets all established competencies for educator faculty. Presenters and attendees were diverse in terms of academic rank and represented 12 clinical departments, 7 basic science departments, dental medicine and physical therapy. Of research "works in progress" from 2014-2017, 14 peer-reviewed fellow and faculty publications resulted, with an additional 5 manuscripts in revision or under review. Of those projects presented during the past academic year (2017-2018), 2 have gone on to peer-reviewed publication and 4 others are currently in revision or under review. We report data from the most recent academic year separately, given the expected lag time prior to publication. Because presenters and attendees are volunteers, the FDP's 10-year track record is evidence of faculty satisfaction with the programming. We have identified key factors for implementation and sustainment of similar FDPs at other institutions: establish a clearly defined mission statement that meets the needs of the target audience and engenders engagement and ownership, identify champion(s) to lead the effort, capitalize on local talent and expertise, and secure institutional backing.

A TEACHER, A LEARNER AND A SET OF OBJECTIVES. SAME PLAYERS, DIFFERENT GAME. INNOVATING MEDICAL EDUCATION THROUGH CHANGING FOCUS.

Shahnur Sayjad¹; Jennifer Velasco¹; Amar R. Chadaga²; Armand Krikorian³. ¹UIC/Advocate Christ Medical Center, Oak Lawn, IL; ²Advocate Christ Medical Center, Oak Lawn, IL; ³University of Illinois at Chicago/ Christ Medical Center, Oak Lawn, IL. (Control ID #3186073)

NEEDS AND OBJECTIVES: As residents, we have the responsibility to teach medical students beyond the books during their wards rotation. A Dedicated Teaching Resident (DTR) has the ability to influence medical students' learning. - To provide a framework for the DTR to enhance students' learning experience; explore his/her own style of teaching, practice creativity and flexibility in approaching medical topics; practice leadership and mentorship. - To facilitate active learning; provide opportunities to research and learn how to learn effectively. - To practice consistent teaching amongst the inpatient teams, with set objectives.

SETTING AND PARTICIPANTS: An ACGME-accredited Internal Medicine Program in a tertiary care center. An inpatient team consists of a DTR with students on their internal medicine rotation.

DESCRIPTION: 3 components of this initiative: 1) DTR, 2) dedicated teaching curriculum, 3) implementation of curriculum via exploration of various teaching strategies. Every month, each team has a DTR who is responsible for the medical education of 2-3 students. Each day, the DTRs have the flexibility to teach any topic the students are interested in based on their teaching style and the students' learning styles. For each topic, the DTR and students are encouraged to find a patient with the specific diagnosis and learn through incorporating the history and physical exam, clinical presentation, labs, differential diagnosis and management in their learning.

EVALUATION: - Qualitative survey for the students, assessing knowledge checks and overall learning experience - Weekly DTR meetings for formative feedback with the program director and development of his/her teaching portfolio

DISCUSSION / REFLECTION / LESSONS LEARNED: The curriculum provides structure and specific objectives, thus serving as a focused framework for the DTR for the concrete delivery of medical topics. In

addition, strategic guidance from the faculty allows the DTR to explore their own style of teaching, identify roadblocks to knowledge, and sharpen their leadership and mentorship skills. It is not enough to just work on facts or recite guidelines. Becoming a good clinician requires a solid foundation of medicine, but equally requires the application of this knowledge in the context of a patient. Hence, the actual process of learning is integral to becoming a good clinician. Through this initiative, we hope to facilitate learning for the students, and help our educators realize their own potential. We are still in the initial phases of our project and hope to achieve feedback through the surveys and weekly meetings in the coming months.

ONLINE RESOURCE URL (OPTIONAL): https://drive.google.com/file/d/1nig_BADE7t0GI_mh3maAygmySvRZDBRa/view?usp=sharing

A TELEHEALTH CURRICULUM FOR INTERPROFESSIONAL TRAINEES AND STAFF

Janeen E. Smith^{1, 2}; Bridget C. OBrien³; Maya H. Dulay⁴; Leonie Heyworth⁵; Omar Aljundi¹; Rebecca L. Shunk⁶; Christopher Sha^{1, 2}; William B. Smith²; Amy D. Lu⁷. ¹San Francisco VA Health Care System, San Francisco, CA; ²University of California, San Francisco, San Francisco, CA; ³Univ of California, San Francisco, San Rafael, CA; ⁴UCSF/VA, San Francisco, CA; ⁵VA San Diego Healthcare System, La Jolla, CA; ⁶UCSF, San Francisco, CA; ⁷San Francisco VA Medical Center, San Francisco, CA. (Control ID #3174741)

NEEDS AND OBJECTIVES: Access to medical care for rural and underserved patients is adversely affected by distance associated time and cost burdens. Telehealth has expanded access to care for many patients, allowing them to see their providers from the convenience of their own homes. However, telehealth home visits are underutilized because providers lack the confidence and skills necessary to conduct such visits. To address this training gap, we designed a curriculum to teach trainees and staff to perform safe video visits, employ virtual physical exam techniques, utilize peripheral devices and develop new care pathways.

SETTING AND PARTICIPANTS: The Department of Veterans Affairs introduced VA Video Connect (VVC) in July of 2017. VVC connects Veterans to their care team via a secure online platform. Residents, students and staff from medicine, nursing, pharmacy and psychology participate in the curriculum.

DESCRIPTION: The curriculum consists of 3 hour-long sessions delivered over 6 months. The first session covers equipment, technology, safety, contingency planning, documentation and completion of national VA VVC training requirements to perform video visits. Learners take turns role playing providers and Veterans to learn the functions of the virtual medical room. In the second session learners use VA issued tablets and peripheral devices and practice a virtual physical exam in simulated cases. The third session focuses on appropriate health concerns for video visits and integration into clinic workflow.

EVALUATION: Thirteen trainees and staff participated in the first session. Their average self-assessed ability to do a video visit, rated from 1=poor to 5=excellent, increased from 1.9 (± 1.3) pre-session to 3.5 (± 1.1) post-session. Participants rated their likelihood of incorporating video visits into practice as a result of the session 4.7 (± 0.75), on average. As implementation continues, we will track the percentage of learners who conduct at least one video visit within 6 months and conduct focus groups to identify what content and educational strategies are most and least effective.

DISCUSSION / REFLECTION / LESSONS LEARNED: As early adopters of VVC, we recognize the barriers socioeconomic status and limited facility with telecommunication technologies pose to Veterans, so

we added education on use of VA provided technology and devices into the curriculum. By including real-time practice, learners experience some of the technology challenges encountered in real patient visits. In contrast to most telehealth orientations, our transformative curriculum moves beyond a tour of technology to address integration of technology into routine patient encounters.

ABSTRACT TITLE: FACILITATING REFLECTION ON THE PATIENT DISCHARGE PROCESS: AN EDUCATIONAL INTERVENTION AT THE VA

Matthew H. Zegarek¹; Seonaid F. Hay²; Rebecca Brienza³. ¹Yale University School of Medicine, West Haven, CT; ²West Haven VA Hospital, Madison, CT; ³VA Connecticut Healthcare System, West Haven, CT. (Control ID #3178921)

NEEDS AND OBJECTIVES: Adverse events occur frequently after patients are discharged from the hospital. Successfully orchestrating care transitions is a core milestone for internal medicine residents as defined by the ACGME and ABIM; however, focused education on discharge planning is rare. A 2009 survey showed that only 16% of internal medicine residencies have formal curricula on the topic. Reflection on practice is also a key competency of physicians. The ACGME outlines the needs for residents to investigate, evaluate, and improve their practice. Prior interventions to increase resident reflection on patient discharges have either not been based in the patient care that the learner directly participated in or have required significant investment from institutions and the learner. We designed an interactive session to foster reflection on the post-discharge course of patients that learners directly cared for using easily accessible data at the VA. Our goal is to design an educational program to engage learners in reflection on the discharge process in order to help increase their skills in managing care transitions.

SETTING AND PARTICIPANTS: The intervention consisted of a one-hour educational session at the end of a two-week inpatient internal medicine rotation for residents and students.

DESCRIPTION: Emphasis was placed on reviewing cases that resulted in readmissions or "near misses," using data from the electronic medical record at the VA. The facilitator guided the participants in reflection by reviewing salient themes that arose from the case reviews and assisted participants in identifying practices that they could adopt to prevent future errors or near misses in patient discharges. The participants were asked to complete a survey immediately before and after the educational session to assess its effect.

EVALUATION: After participating, learners had more agreement with the statement "following up on patients improves my understanding of how health systems function." More learners commented on the importance of communication with other providers and with patients in preventing adverse events after discharge after the session. Learners indicated that the session helped them to reflect on the process of discharging patients and helped them create specific goals to change their process of discharging patients. Further statistical analysis is underway.

DISCUSSION / REFLECTION / LESSONS LEARNED: A major goal of medical training is to prepare students and residents to independently and safely design discharge plans. This educational intervention was unique in that it leveraged the electronic medical record of the VA to facilitate learner reflection. The survey results indicate that learners found the session helpful in reflecting on their practice in discharging patients and increased their appreciation of the impact of health systems. Learners reported increased appreciation for the role of communication during the discharge process.

ADDRESSING RESIDENT-IDENTIFIED BARRIERS TO ATTENDING NOON CONFERENCE

David M. Hayes¹; Garrett Rampon¹; Rachna Rawal¹; Fred R. Buckhold².

¹Saint Louis University, St. Louis, MO; ²Saint Louis University School of Medicine, St. Louis, MO. (Control ID #3179394)

NEEDS AND OBJECTIVES: 1. To identify barriers to resident attendance to noon-conference educational sessions 2. To improve the quality of noon-conference 3. To engage attending physicians in noon-conference sessions relating to medical decision making

SETTING AND PARTICIPANTS: Internal Medicine Residency programs utilize noon conference as a key opportunity for formal education for residents. In response to low attendance at our noon conferences, we distributed a survey to our residents assessing conference quality and composition as well as barriers to attendance and implemented changes based on the results of the survey.

DESCRIPTION: Main barriers included patient care obligations (24% of respondents), answering pages (22%), and rounds continuing near or through the beginning of conference (17%). 69% of residents reported attending conference less than 60% of the time. 61% felt guilty for not attending. 86% of residents agreed they would benefit more from conferences if attendings handled their pagers. Comments indicated that faculty attendance and participation at conferences would make the sessions more educationally robust. Interactive conferences and conferences that focused on medical decision-making were more popular than standard didactics.

EVALUATION: In response to survey results, we developed a two-pronged approach to 1) revise and improve our curriculum and 2) address the barriers to attendance. We changed the format of case reports to focus on a medical decision-making teaching point rather than the diagnosis of a rare disease. We introduced a new "Case Series" conference in which senior residents present a challenging case specifically to a panel of faculty. We revived journal club with a new format including pre-session discussion questions and interactive small group discussions. We added a new "High Value Care" conference to introduce educational opportunities pertaining to optimizing resource utilization. We moved much of the core curriculum to a new "Afternoon School" series - a small group based interactive learning series designed to replace standard didactics on high yield topics. We started tracking attendance using a QR code scanned from mobile devices. We revised faculty expectations to include completing rounds thirty minutes prior to conference and strongly encouraged them to attend conferences and hold their residents' pagers. We scheduled educational conferences in the scheduling software to reinforce attendance expectations and empower residents to show attendings their scheduled obligations.

DISCUSSION / REFLECTION / LESSONS LEARNED: Post-intervention survey data is pending. Preliminary data demonstrate clearly higher conference attendance with increased faculty and resident engagement. Residents responded positively to faculty participation in the medical decision-making conferences.

ADVOCACY 101: A CURRICULUM TO ENGAGE PHYSICIAN TRAINEES IN HEALTHCARE ADVOCACY AND ANALYSIS OF ITS IMPACT

Andrea S. Christopher^{1, 2}; Magni Hamso^{3, 1}. ¹Boise Veterans Affairs Medical Center, Boise, ID; ²University of Washington School of Medicine, Seattle, WA; ³University of Washington Boise Internal Medicine Residency, Boise, ID. (Control ID #3187147)

NEEDS AND OBJECTIVES: Over 90% of physicians believe community participation and collective advocacy are very important. Professional organizations highlight training in advocacy skills as a means to improve population health. Movements such as #whitecoatsforblacklives demonstrate trainee interest in advocacy. However, few opportunities exist for physician trainees to learn advocacy skills. We present our Advocacy 101 curriculum, which seeks to empower physician trainees from multiple community training programs in Boise, Idaho with the knowledge and skills to engage in healthcare advocacy. This curriculum is novel due to the inclusion of both undergraduate and graduate level physician trainees from multiple specialties. Advocacy 101 objectives are: 1. Appreciate the physician's role as advocate for patients in the healthcare system, both locally and nationally 2. Gain concrete skills in advocacy and leadership - including speaking with legislators, writing and publishing op eds, and conducting research to inform advocacy 3. Practice advocacy during the Idaho state legislative session.

SETTING AND PARTICIPANTS: We invite participation in Advocacy 101 from University of Washington (UW) medical students, Family Medicine Residency of Idaho residents, UW Boise Internal Medicine residents, and UW Psychiatry Idaho Advanced Track residents. About 20 trainees attend at least one session during each delivery year.

DESCRIPTION: Through an elective series of six 1.5 hour seminars, trainees learn about the history of health reform; discuss the role of physicians as advocates; identify local issues in the state legislature that affect them and their patients; practice writing op-eds and interacting with the media; learn how to most effectively interact with legislators; and learn how to use research to inform advocacy. The curriculum runs concurrent with the Idaho legislative session from January to March, in order to maximize exposure to active policy issues.

EVALUATION: We conduct a pre and post survey of Advocacy 101 participants, which started during the pilot of the curriculum in 2017. Using a 5 point Likert scale, participants reflect on their knowledge of national and local health policy, confidence in various advocacy skills, and personal views about the role of advocacy in their careers. At the course conclusion, trainees showed the most growth in their access to a community of physicians interested in advocacy, knowledge of local health policy issues, experience engaging in advocacy and confidence in speaking with a legislator.

DISCUSSION / REFLECTION / LESSONS LEARNED: Preliminary data analysis shows that as a result of this course, physician trainees reported more knowledge, skills and experience engaging in advocacy. We additionally identify benefits from exposing trainees from different levels of training and specialties to this content together, including collaboration between trainees and faculty from medical education programs across the region and growing the population of physician advocates for rural and medically underserved populations in Idaho.

ADVOCATING FOR CHANGE: A DESCRIPTION OF AN ADVOCACY CURRICULUM FOR INTERNAL MEDICINE RESIDENTS

Benjamin A. Howell^{1, 2}; Lacey R. Whitmire³; Sanjeet Baidwan²; Ross B. Kristal²; Stephen J. Huot²; Tracy Rabin²; Julie R. Rosenbaum². ¹Yale School of Medicine, New Haven, CT; ²Yale University School of Medicine, New Haven, CT; ³Iora Primary Care, Hartford, CT. (Control ID #3183987)

NEEDS AND OBJECTIVES: Advocating for the promotion of societal health is a core professional activity. We propose that formal training of physicians in the knowledge, skills, and attitudes of effective advocacy

should be incorporated into graduate medical education. There are few published models of *how* to teach public advocacy skills to physicians-in-training. We developed a curriculum that exposes residents to a conceptual framework for physician advocacy and builds skills through workshops that are anchored in a topic selected by each resident to enhance engagement.

SETTING AND PARTICIPANTS: Participants are senior residents in a university-based internal medicine program located in an urban medium-sized city. The curriculum is compulsory, contain 12 hours of content, and is delivered in five sessions over a 4-week ambulatory rotation to groups of 4-6 residents. Two faculty members and one chief resident teach the course.

DESCRIPTION: Session 1. Core Concepts: Trainees discuss the ethics of advocacy and how advocacy may fit into their own careers. A framework for developing an advocacy campaign is reviewed and used to evaluate a local advocacy project. Trainees then identify an advocacy topic which they will use as a vehicle to learn skills during future sessions. Session 2. Persuasive Communication: Residents learn techniques for creating public narratives, review examples of persuasive communication, and the elevator pitch. The residents then have a conversation with a local community organizer on local advocacy and coalition building. Session 3. The Power of Narrative: Residents learn the skills of op-ed writing to develop their topics into written calls to action. Session 4. Legislative Advocacy: State and federal legislative processes are reviewed and a primer on techniques for communicating with legislators and their aides is presented. Session 5. Advocacy in Action: Residents research state bills to learn how other advocacy topics have fared in the legislature. Then, residents are joined by a local policymaker for a conversation about health advocacy and the residents' topics of interest. It concludes with the residents delivering their elevator pitches and receiving feedback.

EVALUATION: To date, 48 residents have completed the curriculum. In course evaluations residents most appreciated the skill-building components and the inclusion of non-physician experts. Most residents stated that they would be more likely to engage in advocacy following exposure to the curriculum. Long-term impact of the curriculum will be evaluated through survey of graduates that are five years' post-residency to assess involvement in advocacy and lasting impact of the curriculum on knowledge, skills, and attitudes regarding physician advocacy.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our curriculum on physician advocacy has been well-received. Key success factors include: using a topic of personal interest to each resident as the vehicle for learning advocacy skills, inclusion of non-physician advocates and policymakers, and emphasizing practical skills.

AMBULATORY HANOFFS: A PRIMARY CARE INTERVENTION TO IMPROVE THE END-OF-YEAR TRANSITION TO NEW RESIDENTS FOR HIGH RISK PATIENTS

Lesley E. King¹; Maryann K. Overland²; Christopher Wong²; Ginger A. Evans³. ¹VA Puget Sound/University of Washington, Seattle, WA; ²University of Washington, Seattle, WA; ³VA Puget Sounds HCS Seattle, Seattle, WA. (Control ID #3183982)

NEEDS AND OBJECTIVES: Best practices have been established for safe patient handoffs in the inpatient setting. The outpatient setting is inherently different, with a single transition often serving as the only means of transmitting multiple years of relevant health information. This is particularly pronounced in resident continuity clinics when departing senior residents handoff to incoming interns. While some seminal work has been accomplished in different systems (Pincavage et al, 2012, 2013), in most

residency programs there is little to no signout between residents, and few innovations have focused on transitions to incoming interns. Our objective was to improve the end-of-year ambulatory care transition process by improving communication between departing and incoming residents.

SETTING AND PARTICIPANTS: Internal medicine continuity clinic residents affiliated with an academic internal medicine residency program. We surveyed 164 residents at 8 unique continuity clinic sites. 2 clinical sites participated in a structured signout process with 44 out of 63 potential pairs of departing-incoming residents performing an in-person signout.

DESCRIPTION: We developed an intervention that was implemented at 2 of the 8 continuity clinic sites within our academic system. Our intervention was multi-pronged: a system for departing senior residents to identify patients most at risk of adverse events during their transition in residents, chart documentation of relevant and outstanding issues, and the opportunity to give an in-person signout (during a structured event) to the incoming intern.

EVALUATION: Residents across all 8 clinic sites (intervention and non-intervention) were surveyed on a 5-point scale about the handoff process and asked openended questions on their experiences. Residents who participated in the signout event had increased satisfaction of how their high-risk patients were handed off (3.5 for residents who received signout, compared with 2.9 for residents who had not received signout). Interns received an additional survey and uniformly reported the event as "very helpful" and reported increased confidence in their ability to care for their patients (4.9 out of 5, n = 10). Aggregate results for all surveyed in 2018 showed that those who had received signout had higher transition satisfaction scores compared with those who did not (3.8 compared with 3.1). Those who received in-person signout were much more likely to prefer that method (81% compared with 56% among those who did not receive signout).

DISCUSSION / REFLECTION / LESSONS LEARNED: While the best practices for ambulatory transitions during the handoff between residents remains to be defined, our intervention shows that an in-person "warm handoff" between departing and incoming residents is feasible, desired, and may increase resident satisfaction. We are continuing to work on improvements to the process including identifying ways to incorporate the multidisciplinary team. Our initial work focused on analysis of the resident experience—next steps should include patient satisfaction and outcomes.

AN 'EPIC' IMPROVEMENT IN CARE COORDINATION: IMPLEMENTING A SKILLS LOG TO INCREASE RESIDENT PROFICIENCY IN NEWLY ADOPTED EMR

Rebecca A. Griffith; Anushka Chadha; Afrasiab Khan; David Kuo. Atlantic Health/ Morristown Medical Center, Morristown, NJ. (Control ID #3185849)

NEEDS AND OBJECTIVES: Recent data from the SGIM Medical Residency Clinic Directors Interest Group survey found that 97% of Internal Medicine residency programs use an electronic medical record (EMR) system, 66% of which have a shared single EMR with the hospital, such as EPIC, the current industry leader. EPIC is a powerful platform that holds promise in streamlining workflow but falls short when physicians do not utilize all the functions. This often stems from suboptimal training and can preclude the delivery of comprehensive patient care. Our objective is to investigate a new teaching strategy to increase resident competency in using essential EPIC skills, termed the "3D" approach: demonstration, direct observation, and documentation.

SETTING AND PARTICIPANTS: Our study was conducted at a large regional teaching hospital in New Jersey that recently adopted EPIC in both ambulatory and inpatient settings. Participants included 52 Internal Medicine residents (15 PGY-1, 9 preliminary, 15 PGY-2, and 13 PGY-3) supervised by Internal Medicine and Clinical Pharmacy teaching faculty

DESCRIPTION: This was a 6 month longitudinal study. Program faculty identified 6 functions in EPIC considered essential for the coordination of patient care but underutilized based on previous year's experiences. Trainees completed a survey to self-report their confidence level for writing a result note and result letter, completing a phone encounter, writing a letter to a patient, posting an out-of-office notification, and writing a remind-me note. Residents were provided a one-hour training session on how to accomplish these skills. For the next six months, when trainees performed these tasks in their outpatient clinic, they were required to demonstrate their proficiency for a faculty member and record it in a central skills log. All residents were surveyed again six months later to self-report their confidence level.

EVALUATION: 42 residents completed the initial survey and as of this time 28 residents completed the post survey. Results were stratified by PGY level and interpreted using weighted averages. Confidence levels for completing a phone encounter, posting an out-of-office notification, and posting a remind-me note, increased in at least two of the PGY levels; meanwhile, writing a result note, result letter and letter to a patient, decreased in at least two of the PGY levels. The greatest improvement in confidence level was seen in the PGY-2 class. To date, 59% of the residents completed the EPIC skills log.

DISCUSSION / REFLECTION / LESSONS LEARNED: Using our novel "3D" approach, our residents reported increased confidence in performing more than 80% of essential EPIC skills. Direct observation of residents utilizing EPIC functions provided opportunity for evaluation as well as feedback and instruction. Due to the anonymous nature of the post-survey, we were unable to tell which respondents had actually completed the skills log thus we were unable to determine if there was a correlation between log completion and confidence level.

APPLYING DESIGN THINKING PRINCIPLES TO AN ETHICAL IMPERATIVE: LIVER TRANSPLANTATION

Amanda Simone¹; Lauren Block²; David Marcus³. ¹Northwell Health, Manhasset, NY; ²Northwell Health, Lake Success, NY; ³Northwell Health, New Hyde Park, NY. (Control ID #3184936)

NEEDS AND OBJECTIVES: Design thinking (DT) has been used in business to generate practical ideas to solve problems, but has only recently been applied as a tool in medical education. Here, it has been described as a tool for curricular design and problem solving, but there are no published instances of it being used in a medical ethics context. We used the DT model to redesign a session on the ethics of liver transplantation at one medical school. DT was chosen to allow students to draw on their own experiences in proposing solutions to a real-world problem within the lens of ethics and professionalism.

SETTING AND PARTICIPANTS: Content was delivered to 100 first year medical students in a 150-minute session as part of their ethics curriculum.

DESCRIPTION: The session began as a group discussion on challenges of organ donation in the US and the issue of developing a fair system to allocate limited resources. Students transitioned to groups of 5 to begin the design thinking challenge. Groups were asked to consider alternative solutions to improve patient wait times and fairness of organ distribution

and the ethical impacts of changing the current model. Facilitators led students through DT steps of empathizing on the problem, defining the team's point of view, ideating on potential solutions and ideas, prototyping a specific idea, and testing the idea through oral presentation. The session ended with presentations by the teams on their proposals, with questions and answers by peers and faculty.

EVALUATION: The curriculum was evaluated with a mixed methods design, with confidential pre-and post-surveys including quantitative and qualitative items. Unpaired t-tests and chi-square tests compared survey data, and thematic analysis was used on qualitative items. After the session, students reported an increased understanding of the current liver transplant allocation system ($p < 0.01$) and an increased appreciation of shortcomings of the current organ allocation system in the US ($p < 0.01$). Before the session, 75.3% of students never had any practical experience with DT, highlighting the novel nature of this teaching modality in medical education. After the session, 73.8% of students felt that DT could be used to approach complex health system problems.

DISCUSSION / REFLECTION / LESSONS LEARNED: Design thinking is a tool for generating and exploring ideas from multiple stakeholders to solve problems. We used these principles to encourage medical students to engage with the ethical problems inherent to organ donation. Students displayed improved knowledge and attitudes towards organ donation and design thinking. These results indicate that design thinking is a novel, effective and useful learning framework to use when addressing ethical problems in healthcare.

ASSESSING BURDEN OF CHRONIC DISEASE AMONG THE UNINSURED: AN INTERDISCIPLINARY COMMUNITY OUTREACH

Sayef Mirza¹; Shams Rahman²; Noura Ayoubi¹; Laurie Woodard¹; Rahul Mhaskar¹. ¹University of South Florida, Tampa, FL; ²Bethune Cookman, Daytona Beach, FL. (Control ID #3186402)

NEEDS AND OBJECTIVES: 1. Define specific socioeconomic factors that impact chronic disease morbidity and mortality among the uninsured frequenting free clinics. 2. Integrate the concepts of interprofessional community outreach, health services research, student mentorship, with biostatistics/epidemiology didactics as a part of medical education curricula.

SETTING AND PARTICIPANTS: A retrospective chart review was conducted to collect data on chronic diseases from electronic and paper-based medical records at 9 free clinics in the Tampa Bay area. Charts containing clinic visits from January 2016 to December 2017 were included and analyzed. Redcap was used to organize a comprehensive chart review.

DESCRIPTION: There are over 1,200 free clinics managing uninsured and under-insured patients throughout the United States. Only about 10% of these clinics are affiliated with a medical school where students are involved with operational management. However, data is rarely recorded systematically that would facilitate statistical analysis and outcomes research. Assessing the burden of chronic disease (ABCD) may be an elementary step in assessing the health of a largely 'undocumented' population. A multidisciplinary effort can unite different professions in order to study, analyze and report data about uninsured patients.

EVALUATION: From January 1, 2016 to December 31, 2017, a total of 8857 patients were managed at 9 free clinics. After omitting missing variables, 5074 (58%) were women, 3408 (54%) were Hispanic, and 2019 (46%) were unemployed. In terms of follow-up, 4207 (48%) were seen more than once, and 2613 (30%) were seen more than twice. The mean number of visits was 2.51. Follow-up visits were most common among patients with the

following documented conditions: hypertension (1350, 63%), diabetes (840, 65%), hyperlipidemia (890, 73%), depression (529, 67%), anxiety (462, 68%), arthritis (344, 63%), asthma (336, 66%), anemia (260, 73%), coronary artery disease (130, 59%), cancer (147, 71%), COPD (101, 64%), CVA (102, 71%), MI (55, 63%). The average CCI for all patients was 0.84 with the CCI being 0.64 for patients seen only once, and 1.06 for patients seen for 2 or more visits. Further univariable analyses including chi-square and correlations are reported.

DISCUSSION / REFLECTION / LESSONS LEARNED: Uninsured patients with multiple comorbidities and elevated mortality risk continue to follow up with free clinic providers. Future public health programs should target the common diseases experienced by uninsured patients. Future studies are needed to study effective management of these multiple comorbidities in the free clinic setting. By describing the clinical characteristics of uninsured patients, we can paint a more accurate picture of the state of American health care as we struggle to pay for the price of poverty.

ASSESSMENT AND MANAGEMENT OF SOCIAL DETERMINANTS OF HEALTH IN THE PRIMARY CARE SETTING, AN INTERNAL MEDICINE RESIDENT CURRICULUM

Mary McAllister¹; Mark Troyer²; Lisa Kearns¹. ¹Ohio State University, Columbus, OH; ²Ohio State University Wexner Medical Center, Columbus, OH. (Control ID #3186222)

NEEDS AND OBJECTIVES: Clinicians may see the effects of social determinants on their patients' health but often lack knowledge or confidence in addressing SDH in clinical practice. Medical training has traditionally emphasized the biomedical model over social and environmental factors, leaving physicians with few tools to address SDH. Course objectives: Learners will be able to recognize socially determined barriers contributing to health disparity in at-risk populations. Learners will apply concepts of interdisciplinary care to address barriers to health care. Learners will show consideration for societal determinants of health in care plans in the clinic.

SETTING AND PARTICIPANTS: This course takes place in an ambulatory noon lecture setting. Participants are primary care track residents in the Ohio State University Internal Medicine Residency Program.

DESCRIPTION: We have developed an interactive course to increase knowledge of social determinants of health (SDH) and increase confidence in addressing SDH in the ambulatory setting. Topics addressed include economic stability, language & health literacy, built environment, food security, addressing SDH for individual health, and community-specific resources to optimize patient outcomes. Eight 45-minute sessions are held across two months, consisting of brief didactic teaching followed by interactive activities. These include role play, attitude/bias discussion, vignette or article analysis. Learners complete virtual neighborhood visits of zip codes served by their own clinic by researching SDH metrics (ie income, crime, language) and reviewing evidence tying each metric to health outcomes and disparities. Discussions such as "what can we do?" include pharmacists, social workers, and nurses sharing available clinic resources for addressing SDH with patients.

EVALUATION: To evaluate this curriculum, we are utilizing a pre/post survey for participants. We will measure improvements in knowledge of SDH using multiple choice questions and assess improvements in attitudinal and behavioral/skills outcomes using a 5-point scale that relies on learner self-assessment of confidence in recognizing and managing healthcare barriers. Each survey question is cross-referenced to a learning objective identified in sessions 1-8. The course is currently in progress.

DISCUSSION / REFLECTION / LESSONS LEARNED: This course is a resident-driven initiative to improve awareness of societal determinants of health. Pre-course surveys indicate an awareness of SDH but overall lack in knowledge of how this directly impacts patient care. While our course is still ongoing, we have had anecdotal feedback on the direct applicability of content to patient care. Moreover, resident participants are actively brainstorming and creating additional initiatives to address these concerns specific to our patient population. We are encouraged that by formally introducing this new curriculum, it has resulted in self-directed learning outside of the specific lecture content.

BLOCK OF ADDICTION MEDICINE (BAM!): AN INTENSIVE RESIDENT CURRICULUM IMPROVES COMFORT WITH SUBSTANCE USE DISORDERS

Hadas Reich¹; Kathleen Hanley¹; Lisa Altshuler². ¹NYU, New York, NY; ²NYU School of Medicine, New York, NY. (Control ID #3181811)

NEEDS AND OBJECTIVES: There is an increasing need for resident education on substance use disorders (SUDs). The purpose of our curriculum was to improve residents' knowledge, skills, and attitudes on treating patients with SUDs.

SETTING AND PARTICIPANTS: First and second year residents from NYU's Primary Care, Internal Medicine program participated in the Block of Addiction Medicine (BAM!) curriculum. Clinical settings included buprenorphine/methadone clinics and outpatient treatment programs in a large, urban safety net hospital system.

DESCRIPTION: BAM! is an intensive two week curriculum focused on SUDs. To improve residents' knowledge, we included didactic sessions on substances, including alcohol, opiates, and tobacco. Sessions covered epidemiology, biology, and treatment, including pharmacologic options, with all residents receiving buprenorphine prescribing waiver training. BAM! was delivered by an interdisciplinary faculty that included addiction medicine specialists, department of health officials, and general practitioners, nurses, and social workers who have worked extensively with patients with SUDs. Workshops built skills including screening, brief interventions, and referral to treatment (SBIRT) and motivational interviewing. Residents attended buprenorphine/methadone clinics, outpatient treatment programs, and 12-step (AA/NA) meetings. Residents shared lunch in a non-clinical setting with patients in recovery to understand their perspectives on living with addiction.

EVALUATION: Residents' attitudes and self-perceived efficacy in treating SUDs were surveyed. Pre and post data was obtained on 15 of 16 participants. Using the medical condition regard scale (MCRS), an 11 item questionnaire on biases/emotions/expectations for treating patients with SUD, we found a statistically significant improvement in the composite score, from 44.46 to 47.0 ($p=0.026$). Of 15 residents, 11 reported improved ability to effectively screen for SUD, 10 reported improved comfort in screening patients for SUD, 12 reported improved knowledge in using medically assisted treatment (MAT), and 14 reported improved ability to effectively treat patients with MAT (all $p<.001$ in Wilcoxon signed rank test). Qualitative feedback showed residents felt this curriculum was an essential part of their education; one participant commented: "this is a course that should be offered to every medical care provider."

DISCUSSION / REFLECTION / LESSONS LEARNED: BAM! included a varied curriculum delivered by inter-professional faculty. Residents reported improved comfort in treating patients with SUDs and demonstrated a significant improvement on the MCRS in their already positive attitudes towards treating this patient population. Qualitative feedback indicated that

residents enjoyed BAM! and found it important to their training. Given the increasing need for providers who are able to effectively treat SUDs, courses such as BAM! are an effective and essential part of residency. Further studies are needed to assess if the changes in residents' attitudes persist and whether we influenced practice.

BUILDING A NEEDS-BASED EBM CURRICULUM WITHIN AMBULATORY BLOCK EDUCATION

Melissa Mroz; Thomas Carroll. University of Rochester, Rochester, NY. (Control ID #3185609)

NEEDS AND OBJECTIVES: The learning and practice of evidence based medicine (EBM) is a critical component to internal medicine residency education. Despite dedicated sessions to support EBM skill development, traditional journal club formats have failed to engage learners and foster conceptual understanding. Results of an internal needs assessment identified several areas to target including residents' understanding of probability, interpreting test results, and developing answerable clinical questions using the literature. Given that residents reported feeling disinterested in the current EBM curriculum, we aimed to deliver content in way that actively engaged resident learners and addressed knowledge gaps.

SETTING AND PARTICIPANTS: Seventy-two categorical internal medicine residents at the University of Rochester participated in a revised EBM curriculum delivered during dedicated ambulatory educational half-days. Ambulatory education is protected time from clinical duties held weekly during two-week ambulatory blocks. All residents have at least six blocks of ambulatory medicine per year.

DESCRIPTION: The revised EBM curriculum consisted of six one-hour sessions over one year. The sessions incorporated interactive lecture utilizing audience response and problem-based learning to apply EBM concepts to clinical settings. Sessions topics included: 1) recognition of overconfidence and understanding probability; 2) test interpretation; 3) study design; 4) asking a clinical question; 5) abstract review; and 6) feedback and skills assessment.

EVALUATION: Sixty-eight residents completed the Fresno test of EBM competence at the end of the year-long curriculum and had a mean score of 124 - a value between novice (95.6) and expert (147.5) categories. Resident evaluation further showed that the EBM curriculum was well received, with an overall course rating of 7.8 (SD 1.8) on a Likert scale ranging from 1 to 10 (best). Resident comments supported the numeric score: "EBM this year has been much better than the last 2 years. It was focused on the basic, relevant things we need to know"; "I have enjoyed the back to the basics nature as opposed to reading articles and trying to apply topics we don't truly understand."

DISCUSSION / REFLECTION / LESSONS LEARNED: Resident physicians begin residency with varying familiarity of EBM concepts. Although traditional models of journal club help to facilitate a critical review of the literature, residents may still lack an appropriate foundation to apply EBM skills. Further, many residents were unaware of knowledge gaps. Thus, highlighting learner needs served to emphasize the value of the curriculum. The first session purposely challenged learners' understanding of EBM while remaining well received. Linking EBM concepts to

meaningful clinical examples improved resident engagement. Overall our approach was highly rated by resident learners. Future work will expand EBM across a three-year curriculum to reinforce key concepts and further develop critical appraisal skills.

BUILDING A THREE-YEAR HIGH VALUE CARE CURRICULUM

Jessica Donato¹; Richard Cartabuke². ¹Cleveland Clinic, Beachwood, OH; ²Cleveland Clinic, Painesville, OH. (Control ID #3185087)

NEEDS AND OBJECTIVES: The current economic burden imposed by healthcare is not sustainable. Medical educators have been tasked with not only educating trainees about cost-containment but also shaping their clinical practice with regards to high value care (HVC). Various high value curricular structures have been described but few focus on a longitudinal curriculum spanning the duration of residency training. We sought to develop a three-year HVC curriculum.

SETTING AND PARTICIPANTS: A monthly HVC conference targeting all post-graduate years (1-3) was implemented at a large internal medicine training program starting in the fall of 2017.

DESCRIPTION: Ten one-hour conferences are delivered per academic year from August through May. Each conference covers an inpatient or ambulatory topic including syncope, acute kidney injury, low back pain, and cellulitis. A three-year curriculum has been developed with 30 different topics, such that trainees are not exposed to the same conference throughout their training, and at least one conference per year is dedicated to popular HVC topics such as "things we do for no reason" and "imaging wisely." Each conference includes an interactive small group discussion and faculty-led review of evidence-based management strategies. Each conference also incorporates a discussion of benefits, harm, charges for our institution and value. The conference concludes with take home points for high-value strategies and a 1-page handout to summarize key points.

EVALUATION: Fourteen conferences have been implemented. Attendance has sustained at 43-81 trainees per conference. A survey was administered in March 2018 (N = 55) and revealed knowledge acquisition: 88.9% of residents correctly identified the definition of value, 70.6% correctly identified the high value strategy for managing an upper gastrointestinal bleed, and 83.7% correctly identified the high value strategy for a suspected pulmonary embolism. 100% of trainees noted the principles discussed were relevant to their daily clinical practice. 98% of respondents noted they reflect on their ordering practices and gain new perspective after the conference, and 96% report changes in ordering practices because of the HVC conference. An annual survey is planned to maintain ongoing assessment of this curriculum.

DISCUSSION / REFLECTION / LESSONS LEARNED: Many HVC curricula have been described but few have been established as a three-year longitudinal curriculum. We describe the development of a successful HVC conference with sustained attendance, knowledge acquisition and trainee-reported attitudinal and behavior change. The longitudinal nature of this monthly conference helps to maintain interest and focus on cost-conscious, high value care throughout the three-year training program. Utilization of different topics over three years also avoids redundancy and

allows the curriculum to target all trainee levels concurrently. The conference focuses on fundamental medical topics to maintain relevance and provides evidence-based discussions to provide readily applicable clinical teaching points.

BUILDING A TOOLKIT FOR MEDICAL STUDENTS: ADDRESSING MICROAGGRESSIONS & DISCRIMINATION ON THE WARDS

Raquel Sandoval³; Titilayo Afolabi³; Jordan Said³; Avik Chatterjee²; Daniele D. Olveczky¹. ¹Beth Israel Deaconess Medical Center, Boston, MA; ²Harvard Medical School, Cambridge, MA; ³Harvard Medical School, Boston, MA. (Control ID #3187230)

NEEDS AND OBJECTIVES: Multiple studies suggest that physicians' implicit biases can affect the care that they provide to their patients^{1, 2}. This, in addition to inequalities in the distribution of social determinants of health in society, is thought to contribute to stubbornly persistent health disparities between minority and non-minority populations. These implicit biases often manifest as *microaggressions*.

There has been a deepening understanding of the harmful impact of micro-aggressions on the clinical relationship between patients and health care professionals

SETTING AND PARTICIPANTS: Setting: Harvard Medical Participants: First year students prior to the start of clinical rotations.

DESCRIPTION: A two-hour workshop for rising first year medical and dental students who had completed their first fifteen months of undergraduate medical education and were going to transition to clinical responsibilities was developed. The workshop consisted of (1) a thirty-minute interactive large-group didactic session via PowerPoint presentation that introduced micro-aggressions, discrimination, and frameworks for addressing these issues in the clinical setting, and (2) a seventy-five-minute small-group session during which students worked through two cases by applying the presented frameworks and role-playing scenarios.

EVALUATION: 121 and 105 respondents completed the pre and post workshop surveys respectively. An analysis of 81 pairs of pre- and post-workshop surveys was performed. Pre-workshop, 77.7% had encountered some form of a micro-aggression during a clinical experience at least once. Students were also asked to self-assess their challenges responding to micro-aggressions in the following competencies: "Fear of retribution," "Difficulty recognizing," "Not sure what to say or do," "Lack of allies," and "Lack of familiarity with institutional support." Self-assessment strength was checked against a micro-aggressions definition and identification task in the post-survey.

DISCUSSION / REFLECTION / LESSONS LEARNED: Discussion: Our results demonstrated that the workshop broadly improved self-assessed participant competencies for recognizing and combating micro-aggressions in a clinical setting. Post-workshop, perceived challenges to addressing micro-aggressions and episodes of discrimination on the wards decreased for all of the barriers and sub-groups except "Fear of retribution," which remained a barrier for all respondents post-workshop. Conclusion: The prevalence of micro-aggressions in the clinical environment remains significant. A two-hour workshop resulted in a significant decrease in perceived challenges in addressing micro-aggressions.

BUILDING CAMARADERIE, COMMUNITY AND MENTORSHIP: FOSTERING PROFESSIONAL DEVELOPMENT THROUGH RESIDENT-LED WOMEN IN INTERNAL MEDICINE PEER GROUP (WIIM)

Anna Buteau¹; Anupama M. Kapadia²; Meera Bhakta¹; Liwayway R.

Andrade¹; Holli T. Sadler¹; Anne Cioletti³. ¹Dell Medical School at UT Austin, Austin, TX; ²Dell Medical School at the University of Texas at Austin, Austin, TX; ³University of Texas Dell Medical School, Austin, TX. (Control ID #3185740)

NEEDS AND OBJECTIVES: As women enter the field of medicine in increasing numbers, literature shows they have decreased quality of life and blunted career advancement. One solution is to amplify mentorship and sponsorship for women by women. Due to limited numbers of mentors and sponsors, it is difficult for female learners to receive individualized guidance. Objectives for WiIM: 1. Enhance opportunities for peer mentoring amongst female residents 2. Amplify mentorship and sponsorship by internal medicine female faculty

SETTING AND PARTICIPANTS: This informal curriculum is for all female residents and faculty. Each event was hosted at a member's home.

DESCRIPTION: Eager for camaraderie, a group of female residents united to create an informal peer group focused on women in internal medicine, coined WiIM. Initially, only residents attended, but the group rapidly identified the added value of including faculty. The monthly gatherings provide an opportunity to socialize, network and to discuss relevant readings and topics, including advocacy, mentorship and resident-based concerns. Crowdsourcing topics from the group, we have discussed challenges unique to women, including preserving balance yet advancing in the hierarchical worlds of medicine and academia. Faculty shared their experiences negotiating contracts and salaries as well as ongoing challenges as women in medicine.

EVALUATION: Initially, feedback was informal and anecdotal. Attendance has been our strongest measure of success, as 64% percent of women residents and 64% of women faculty have attended at least 1 out of 5 meetings. While data on participation preferences, motivation for attendance, and benefits of attending is still being collected, we continue to collect comments that illustrate the level of interest: "after 2 hours at one of these sessions, it is the same high I get after going to a conference for a couple of days!", "loved the collaborative aspect and networking" and "I absolutely loved these events- I was able to get to know my attendings on a very personal level and identified with their continued struggles as women physicians in medicine."

DISCUSSION / REFLECTION / LESSONS LEARNED: Though research regarding career fulfillment among women in medicine is limited, there is an increasing demand to create an environment where women can thrive and to ensure that they are given opportunities for career advancement. Our WiIM group is unique in that a resident-driven solution to an unfulfilled need now amplifies mentorship and sponsorship by faculty. The growth of WiIM speaks for itself. Female residents from other programs within our institution and visiting medical students have enthusiastically asked to be included in our meetings. Next steps for the organization are to establish a framework to pass on management of the group year over year, to invite more women leaders to our group, and to explore expanding across all residencies. Maintaining an intimate environment will be a challenge.

CHALLENGES IN RESIDENT CLINIC EMPANELMENT: INVESTIGATING AND INTERVENING UPON THE PANEL TRANSFER PROCESS

Lydia A. Flier; Sarah Knapp; Mariana Gonzalez; Rebecca Glassman. Beth Israel Deaconess Medical Center, Boston, MA. (Control ID #3163550)

NEEDS AND OBJECTIVES: (1) To assess the annual panel transfer process between graduating residents and incoming interns at a primary care

clinic. (2) To propose and enact improvements to the panel transfer process. (3) To assess the improvement in the panel transfer process following interventions.

SETTING AND PARTICIPANTS: A fully-integrated resident primary care practice within an academic primary care center at a tertiary care hospital. Approximately 30 residents graduate each year and transfer their panels to new interns.

DESCRIPTION: Empanelment refers to patients being linked with individual primary care providers and care teams in a way that is recognized by the patient, providers, and practice. This is essential to functional primary care, and in particular - as part of the continued shift towards Accountable Care Organizations - practices need to be able to identify a given physician's panel. Resident practices have frequent, predictable turnover, as every year outgoing residents pass along a panel of patients to new interns. Unfortunately, there are no "best practices" for panel transfer. This is a high-risk period for patients, especially those with multiple co-morbidities. We assessed the existing panel transfer process between residents who graduated in 2016 and incoming interns that year. We reviewed a 50% random sample, 15 resident panels with a total of 1439 patients who were transferred. A chart review identified whether the patients were seen over 18 months following transfer and by whom. We selected 18 months to provide a generous margin of error to capture annual visits in addition to chronic disease follow-up. Based on our findings, we enacted several changes of various scale to address gaps in the panel transfer process and to improve empanelment.

EVALUATION: We found that 41.6% of patients were not seen by our institution's primary care providers over this period time. On further assessment, the majority were under 40 years old and did not have chronic diseases. However, we found that one third of patients (248) were due for preventative health screening, and that 59 patients with a chronic disease were lost to follow up. There was no apparent difference in attrition based on gender, race/ethnicity, or language.

DISCUSSION / REFLECTION / LESSONS LEARNED: We enacted multiple changes to improve the panel transfer process. We initiated a personalized letter written by the outgoing physician informing patients of their new provider. We provided dedicated time for graduating senior residents and incoming interns to discuss their patients. We also created a "return to care" order in our electronic medical records that allows for outgoing residents to indicate when patients should return for care, helping the practice to provide outreach for scheduling and better track patients who are lost to follow up. These changes have been in place for six months and we are just beginning to collect data on the utility and efficacy of the changes.

CHOOSE YOUR OWN ADVENTURE IN INTERPROFESSIONAL EDUCATION

Madelyn Alvarez¹; Christine J. Kolehmainen²; Jessica M. Baier¹; Gladys Roman-Rosado¹; Ronda Tippie¹; Jo Ellen Uptegraw¹; Heather O'Hearn¹; Alishea Serwe-Behnke¹; Bennett Vogelman³; Molly Carnes⁴; Robert Holland¹. ¹William S Middleton Memorial VA Hospital, Madison, WI; ²University of Wisconsin, Madison, WI; ³University of Wisconsin, Madison, Madison, WI; ⁴University of Wisconsin-Madison, Madison, WI. (Control ID #3184223)

NEEDS AND OBJECTIVES: The ACGME requires training in interprofessional (IP) models of care. The University of Wisconsin Internal Medicine (IM) Residency Program developed an interprofessional education (IPE) curriculum using gaming to help learners advance their IPE

foundational and applied knowledge. The primary objective is for residents to describe the importance of the four domains of IPE as defined by the Interprofessional Education Collaborative (ethics/values, roles/responsibilities, communication, and teamwork) and practice application of this understanding using a game.

SETTING AND PARTICIPANTS: Our pilot curriculum includes 32 IM residents with a continuity clinic at the affiliate Veteran's Hospital. They will participate in the training during their four-week primary care rotation block.

DESCRIPTION: We created a blended curriculum with online and face-to-face activities. The online portion includes a novel choose-your-own-adventure (CYOA) game, didactic PowerPoints and videos. The in-person activities include facilitated discussions, interviewing and shadowing a team member for perspective taking and leading an IP team meeting. We chose to develop a CYOA style game that creates an individualized story for each learner and a memorable and enjoyable experience. The game provides the resident the flexibility of asynchronous education and allows them to interact with a virtual patient and IP team in a realistic way in that their choices have consequences. The resident's personalized avatar fosters emotional buy-in for these outcomes. The adventure follows a resident through clinical scenarios and highlights the importance of an IP approach to achieve a "good ending" to the story. In development, we engaged an IP team, including physicians, nurses, clerical staff, pharmacists, and social workers to enhance IP learning, make the storyline cohesive and choices realistic. UW-Madison's technology team used the software "Storyline" to make the game and add visual appeal.

EVALUATION: The residents will complete the Interprofessional Collaborative Competency Attainment Survey as a pre and post self-evaluation and write a post-course reflection. An IP team member will use the individual Teamwork Observation and Feedback Tool to evaluate teamwork, shared decision making and leadership.

DISCUSSION / REFLECTION / LESSONS LEARNED: We have learned that developing a CYOA game to promote IPE is challenging but has many advantages. CYOA gaming offers asynchronous methods of learning that maintain realistic, interprofessional interactions to enhance IPE applied knowledge in a fun and stimulating way. Intentionally constructing a strategy for each storyline, specifying the scope of the story at the beginning of the project, and being explicit about the educational objective for each decision tier can help to offset development challenges. Collaborative development of the game with an interprofessional team was critical to optimize the learning value of the game and include rich educational elements into the story from informal interactions, which are typically unobserved.

CLINICALREASONING.ORG: IMPROVING ACCESS AND ENGAGEMENT WITH CLINICAL REASONING TEACHING MATERIALS THROUGH WEBSITE REDESIGN

Gregory M. Ow¹; Gabrielle Berger²; Juan N. Lessing³; Denise M. Connor⁴; Rabih Geha⁴; reza manesh⁵; Jeff Kohlwes⁴; Geoffrey V. Stetson⁴. ¹University of California, San Francisco, San Francisco, CA; ²University of Washington, Seattle, WA; ³University of Colorado, Denver, CO; ⁴University of California, San Francisco and San Francisco VA Medical Center, San Francisco, CA; ⁵Johns Hopkins University, Baltimore, MD. (Control ID #3143133)

NEEDS AND OBJECTIVES: The Exercises in Clinical Reasoning (ECR) series in the Journal of General Internal Medicine (JGIM) is a unique and growing series of 30 case-based problem-solving manuscripts, designed

to teach the foundations of clinical reasoning to both educators and students. For selected cases, the ECR team has produced case presentations and instructor guides. These novel and freely downloadable materials are available on the JGIM website. However, site analytics reveal that: although these materials are frequently accessed (~8100 users in 2017), users do not remain engaged with the material (~90% of visitors visit only one page in the website, i.e. the bounce rate = ~90%). The ECR editorial team has hypothesized that the lack of engagement is due to poor website design. 1. The goal of this project is to create a new, streamlined, and easy-to-use ECR website to promote free access to case-based clinical reasoning materials. 2. The improved design will be evaluated for the hypothesized increased user engagement. The specific target is to reduce the bounce rate from ~90% to 70%, measured over the course of 6 months (September 2018 to March 2019). 3. The design will also be evaluated with the validated LIDA assessment tool from Minervation, a tool which provides a granular quantitative scoring of a website's usability, accessibility, and reliability.

SETTING AND PARTICIPANTS: [ClinicalReasoning.org](#) is accessible to educators and students worldwide.

DESCRIPTION: An updated ECR website was designed using the foundational principles of visual design — proximity, alignment, repetition, and contrast. In summary, these principles respectively state that: (1) logically related elements should be placed close together, (2) elements should be purposefully positioned, (3) style conventions and patterns should be consistent throughout, and (4) use large (rather than small) visual differences in color, typography, and size. In addition to visual improvements, the redesign also included simplification of website navigation. [ClinicalReasoning.org](#) went live on September 2018, and provides free access to the ECR teaching materials.

EVALUATION: Design evaluation utilized the LIDA tool, which revealed an improvement in usability from 29 to 48 on a 54 point scale. Data from Sept. to Dec. 2018, when compared to data from Jan. to Dec. of 2017, reveals a large and statistically significant improvement in bounce rate from 87.70% (n = 8100 views) to 47.49% (n = 1625 views), p < 0.0001 using N-1 chi-squared.

DISCUSSION / REFLECTION / LESSONS LEARNED: The freedom of web resources has increased accessibility of education materials. Anyone in the world with any level of training can access ECR resources to learn, practice, and teach clinical reasoning. However, the freedom of web resources also creates an unstructured environment, where user interaction can suffer because of poor or inconsistent design. Incorporation of visual design principles and a user-centric approach to education material greatly increases immediate visual appeal and long-term user engagement.

ONLINE RESOURCE URL (OPTIONAL): [ClinicalReasoning.org](#)

CREATING A LEADERSHIP CURRICULUM FOR WOMEN IN MEDICINE: WOMEN IN LEADERSHIP DEVELOPMENT (WILD)

Bridget Keenan; Anne G. Montgomery; Anjali Thakkar; Catherine Burke; Haley Crossman; Shirin Hemmat; Arielle Klepper; Lekshmi Santhosh. UCSF, San Francisco, CA. (Control ID #3180516)

NEEDS AND OBJECTIVES: Though women account for nearly half of US medical students and residents, they are underrepresented at higher levels in academic medicine. A lack of structured leadership skills curricula targeting women trainees contributes to this gap. The Women in Leadership Development (WILD) curriculum was therefore developed within the Department of Medicine at the University of California, San Francisco (UCSF) with the goal of building community and providing leadership training for women trainees hoping to launch their careers in academic medicine.

SETTING AND PARTICIPANTS: WILD serves women residents and fellows at UCSF. During the first two years of programming (2017 and

2018), a total of 77 trainees within the Department of Medicine attended a daylong WILD symposium. Based on the Symposium's success, a yearly longitudinal curriculum was implemented at the GME level for the 2018-2019 academic year, serving women trainees across all specialties.

DESCRIPTION: The WILD Symposium is a daylong course with the objectives of skill-building, mentorship, and networking. Skill sessions focus on public speaking, conflict resolution, microaggressions, and advocacy, with presenters from both inside and outside of academic medicine. This year, we have expanded WILD to include monthly skill-building sessions for women trainees across specialties ("WILD: Series") as well as quarterly events for trainees within the Department of Medicine focused on networking and community building ("WILD: IM").

EVALUATION: Prior to implementation of the WILD Symposium, we conducted a needs assessment to survey women residents about their interest in a leadership course. 93% had some level of interest. Topic areas of interest included negotiation, CV development, self-promotion, communication, networking, work-life balance, and the art of "saying no." Of 77 participants surveyed after the event, over 90% agreed that participation in the symposium was a useful experience and would strongly recommend the session to other trainees. The public speaking session received the highest reviews.

DISCUSSION / REFLECTION / LESSONS LEARNED: While challenges remain for women trainees in academic medicine, leadership training represents one possible solution to address gender disparities. The strong positive response to the WILD Symposium reinforced the need for improved leadership training among women residents and fellows at UCSF.

CREATING CLINICIAN EDUCATORS: ASSESSMENT OF A RESIDENT-AS-TEACHER ELECTIVE IN GRADUATE MEDICAL EDUCATION.

Geoffrey V. Stetson¹; Jessica Beaman¹; Adeena Khan²; Bradley A. Sharpe².

¹University of California, San Francisco, San Francisco, CA; ²UCSF, San Francisco, CA. (Control ID #3183696)

NEEDS AND OBJECTIVES: Residents are expected to assume many roles: clinician, team leader, and teacher. At UCSF, there are brief formal didactics focused on teaching but no longitudinal experience for internal medicine residents to gain the skills necessary to be a successful teacher. In Spring of 2015, a needs assessment using focus groups revealed uniform desire for a primer in foundational clinical teaching skills. Key experts and stakeholders gathered to determine objectives for a month-long elective: understand best practices and demonstrate improvement in the areas of outpatient precepting, delivering feedback, whiteboard presentations, public speaking, entrusting learners, and teaching at the bedside.

SETTING AND PARTICIPANTS: Participants were third-year internal medicine residents at UCSF. The elective accommodates one learner per month. The course is spread across the three principal learning sites of our university. In our first two years we worked with learners during 22 of the available 24 month-long sessions.

DESCRIPTION: The elective consists of 11 unique and tailored half-day activities which build foundational concepts that support the learning objectives. Opportunities for implementation of skills are provided, followed by targeted feedback, and an opportunity to demonstrate improvement. Each activity or exercise has an accompanying faculty mentor, pre-reading, and reflection activity. Assessment of the elective was done using a Likert-style retrospective pre/post self-assessment method (Skeff 1992) to analyze changes in confidence level related to each of the teaching skills addressed in the curriculum and satisfaction with the elective experience (Kirkpatrick Levels 1&2). 20/22 learners completed the end-of-rotation evaluation.

EVALUATION: Data from the surveys compared pre-elective to post-elective using chi-squared statistics. Results showed a significant increase in confidence ($p<0.05$) in learners' ability to deliver an effective whiteboard talk ($p=0.018$), and in their upcoming transition to a post-residency role ($p=0.025$). Two other areas approached significance ($p<0.10$): giving effective feedback to a learner ($p=0.082$), and teaching at the bedside ($p=0.10$). 95% of learners reported they would either recommend or strongly recommend the elective to a classmate.

DISCUSSION / REFLECTION / LESSONS LEARNED: This curriculum provides a unique opportunity for residents to invest time in learning evidence-based strategies and build a foundation for becoming a medical educator. Our goal was to create an elective that would fit within the current scheduling structure of our residency but allow for an individualized approach to building specific skills. Both quantitative data and narrative responses show that we have developed an effective, flexible, and learner-centered course.

CRITICAL CARE CURRICULUM FOR INTERNAL MEDICINE INTERNS TRANSITIONING TO SUPERVISING RESIDENTS IN THE MEDICAL INTENSIVE CARE UNIT- A TARGETED NEEDS ASSESSMENT

Dimple Shah; Karen Friedman; Gulrukh Zaidi. Donald and Barbara Zucker School of Medicine at Hofstra/Northwell, Manhasset, NY. (Control ID #3184858)

NEEDS AND OBJECTIVES: To conduct a medical education needs Assessment of internal medicine (IM) residents and critical care faculty (CCF) to determine if there is a gap in critical care knowledge in residents transitioning from internship into second year residency.

SETTING AND PARTICIPANTS: Categorical IM residents (PGY 1,2,3) and CCF at Northwell Health.

DESCRIPTION: We surveyed the categorical IM residents and CCF to determine 1) the perceived level of preparedness of rising second year IM residents to take on the role of a supervising resident in the medical intensive care unit (MICU) 2) whether a critical care curriculum would be beneficial for rising second year IM residents, and 3) which subject areas in a critical care curriculum would be most valuable for residents. Surveys were conducted on a 5 point Likert Scale (strongly disagree, disagree, neither agree/disagree, agree or strongly agree) to determine preparedness and necessity of the curriculum, and a ranking system to determine the topics of greatest importance (1-8).

EVALUATION: 42 IM Residents (41.5%) and 16 CCF (59.2%) filled out the survey. For senior resident preparedness in MICU, 41% of IM residents and 70% of CCF felt the rising second year IM residents were not adequately prepared. 90% of IM residents and 100% of CCF agreed that a critical care curriculum would be beneficial prior to IM residents taking on the role of senior resident. Both IM residents and CCF ranked (on scale from 1-8, 8 being most important) shock and vasopressor management (average score IM: 6.83, CCF: 6.44) as the most important topic to cover, followed by acute respiratory failure (IM: 6.49; CCF 6.06), ventilator management (IM: 5.55, CCF: 4.06) and acid base disorders (IM: 5.3; CCF 4.5).

DISCUSSION / REFLECTION / LESSONS LEARNED: The results of our study show both IM residents and CCF felt there is a gap in critical care education for residents transitioning from internship to taking on the role of a supervising senior resident. Key areas of focus for a critical care curriculum were identified via our survey study. Based on our needs assessment, we will develop a curriculum aimed to prepare rising second year residents to take on the role of a supervising resident. The pilot curriculum will provide high yield didactic and interactive videos on the topics of shock and vasopressor management, acid/base disorders and acute respiratory failure. IM residents will be

tested on practical knowledge in the form of a pre and post multiple choice test and OSCE.

DESIGNING A MEDICAL-LEGAL COLLABORATION FOR MEDICINE RESIDENTS

Jo Henderson-Frost¹; Aisha James¹; Nancy Lorenz²; Hannah Tanabe²; Julian Mitton¹. ¹Massachusetts General Hospital, Newton, MA; ²Greater Boston Legal Services, Boston, MA. (Control ID #3185764)

NEEDS AND OBJECTIVES: Health concerns, from disability to mental illness, impact the legal considerations of clients, while social determinants of health, from housing insecurity to criminal records, impact health outcomes. Despite this interdependence, few partnerships exist between the medical and legal professions, and training opportunities in this space are rare. To address this need, we designed a participatory, community-based, medical-legal collaboration (MLC) for medicine residents.

SETTING AND PARTICIPANTS: The Massachusetts General Hospital (MGH) Department of Medicine partnered with the Greater Boston Legal Services (GBLS) to create the MLC. Eight sessions took place over the 2017-2018 pilot year, and consisted of case presentations and discussion in an interdisciplinary seminar format. Residents participated in the MLC during a physician advocacy elective.

DESCRIPTION: The sessions were led by two MGH faculty, one resident, and two GBLS attorneys. In preparation for the seminar, residents were asked to identify a patient with a legal question impacting their health. Consent was obtained and background information collected to prepare a de-identified case presentation. During the seminar, attorneys provided advice and counsel, and offered resources to help address legal concerns. In turn, the GBLS attorneys prepared questions from de-identified client medical charts, or asked general medical questions relevant to case arguments. The resident reviewed the charts and presented educational tutorials during the seminar to address these questions. In the final step, learned information was relayed back to the patient and care team, and client and legal team respectively.

EVALUATION: After each MLC, the residents' experience was reviewed. Additionally, all participants were asked to complete an anonymous survey regarding the utility of the session and the main learning points. Results are currently under review.

DISCUSSION / REFLECTION / LESSONS LEARNED: During the MLC, participants had the opportunity to probe to the depth of the issues facing their patients and clients and share relevant, case-based expertise. The information from the legal advice frequently resulted in actionable items that impacted a patient's care. Moreover, the information from the medical advice impacted legal cases and led to client success. We anticipate participants will value the educational component of the collaboration. We expect to identify challenges in relaying salient information from the MLC to patients.

DEVELOPING AN INTEGRATED CASE CONFERENCE IN A HOMELESS VETERANS CLINIC

Michael Soh¹; Brianna J. Cowan³; Kerri Schutz². ¹Greater Los Angeles VA, Los Angeles, CA; ²West Los Angeles VA MC, Los Angeles, CA; ³UCLA, Los Angeles, CA. (Control ID #3186191)

NEEDS AND OBJECTIVES: Research has shown that because homeless Veterans generally access care in a haphazard fashion (Tsai et al., 2017), lack consistent follow-up, and typically do not have established access to a phone or mailing address, it is imperative that a space be created for team members to prepare for these issues and provide intervention, consultation, and

collaboration (Lie, et al., 2016). In our clinic, we implemented an integrated case conference (ICC) that was accessible to all parties and identified specific actions items for improved quality and delivery of care.

SETTING AND PARTICIPANTS: This interprofessional (IP) practice/training site is in a large VA clinic for homeless Veterans (~3,000 patients). The clinic provides primary and mental health care and social work services within a patient-centered medical home (PCMH). As of January 2019, over 30 trainees representing specialties including internal medicine, advanced nursing, pharmacy, psychiatry, and psychology are currently in clinic.

DESCRIPTION: The goals of our ICC were to discuss urgent needs, identify opportunities for collaboration, and create an integrated treatment plan. That said, cases were selected by the trainee based on urgency and opportunity for IP collaboration. Prior to, presenters conducted a chart review, prepared a brief summary, and shared potential IP questions with their team. During the ICC, meeting roles were assigned, questions were discussed, and action items were identified.

EVALUATION: The aims of the conference were to recognize needs for IP collaboration, perform IP roles, educate others about their professional expertise, and incorporate the expertise of other professions into their practice. As such, over the course of one training year, we deployed two evaluation tools - a weekly instrument that examined each case presentation and its impact and satisfaction, and a 6- and 12-month instrument that explored changes in trainee attitudes and behaviors related to IP collaboration, professional expertise integration, and IP role confidence. In total, weekly data from 21 ICCs was collected, with approximately non-unique 250 trainees and attending participants, and 20 trainees completed the 6- and 12-month instruments.

DISCUSSION/REFLECTION/LESSONS LEARNED: Evaluation data from our trainees indicates that the ICC led to statistically significant increases in translation of knowledge from other professions into a treatment plan, ability to formulate and recommend a collaborative and coordinated care plan for their patients, and confidence in working collaboratively with primary care and/or mental health providers. Additionally, nearly 75% of trainees reported being "very satisfied" with the ICCs they participated in. Over the past year, we've learned that our ICCs benefit from a consistent structure (day, time, location), advanced notice of case-based questions, and selecting patients that are at least semi-engaged with the clinic, among many others.

DEVELOPING EQUITY REPORTS FOR RESIDENTS TRAINING IN PRIMARY CARE

Muriel Jean-Jacques¹; Andrew J. Cooper²; Lauren A. Gard²; Mita S. Goel²; Paul Ravenna²; Aashish Didwania³; Matthew J. O'Brien²; Stephen Persell².

¹Northwestern University Feinberg School of Medicine, Chicago, IL; ²Northwestern University, Chicago, IL; ³Northwestern Medicine, Chicago, IL. (Control ID #3185578)

NEEDS AND OBJECTIVES: The ACGME has concluded that there is a substantive deficiency in preparing residents to identify and address health disparities. In particular, most clinical learning environments lack a formal approach for identifying disparities in quality. Barriers to systematically examining disparities include inconsistent documentation of race/ethnicity and limited capture of sociodemographic variables. Resident-specific challenges include accurate patient attribution and smaller patient panels. Our goal was to develop a methodology for systematically providing feedback about disparities in ambulatory care quality to residents.

SETTING AND PARTICIPANTS: Equity reports were developed for internal and family medicine residents training in two urban GME programs within a single healthcare system.

DESCRIPTION: Five quality measures were included in the equity reports:

breast and colon cancer screening, blood pressure and diabetes control, and statin therapy. Each measure was stratified by race/ethnicity, insurance, preferred language, and whether or not the patient lives in a Census block group with a high level of poverty. We tested 3 methods for attributing patients to residents and examined 3 levels of granularity for the equity reports: individual resident panel; panel of all patients attributed to residents; and all patients in the practice. For each level, we determined the number of measures with sufficient numbers of patients to make meaningful comparisons by subgroup in order to identify the appropriate level of granularity for the equity reports.

EVALUATION: The attribution rule that assigned patients to the physician who had seen them for the greatest proportion of encounters performed best on measures of resident panel size and continuity, while attribution based on listed PCP performed worst. It was not possible to create equity reports at the individual resident panel level as no measures had sufficient numbers of patients to allow for reliable comparisons. Most measures had sufficient patients when all resident panels were combined, and all measures had sufficient patients when all patients in the practice were included. Disparities were identified for at least one subgroup for 4 measures.

DISCUSSION / REFLECTION / LESSONS LEARNED: We identified several lessons in our effort to develop health equity reports for residents training in primary care that may be applicable to others. 1. Even in a healthcare system that, like most, has not yet implemented the routine assessment of disparities as part of their quality tracking protocols, it was feasible to create equity reports that included a range of sociodemographic variables. 2. Geocoding allowed us to include a measure of socioeconomic position. 3. Relatively straightforward methods could be applied to attribute patients to resident physicians. 4. While residents did not have large enough patient panels to create equity reports at the individual resident panel level, it was possible to create equity reports when all resident panels were combined or at the practice level.

DEVELOPING MEDICAL STUDENT LEADERSHIP, TEAMWORK, AND COMMUNITY ENGAGEMENT THROUGH IMPLEMENTATION OF A NOVEL SERVICE-LEARNING CURRICULUM IN THE DENVER HEALTH LONGITUDINAL INTEGRATED CLERKSHIP (DH-LIC)

Catherine Ard¹; Jennifer Adams²; Margaret Tomcho². ¹University of Colorado, Denver, CO; ²Denver Health, Denver, CO. (Control ID #3179970)

NEEDS AND OBJECTIVES: It is estimated that the Social Determinants of Health (SDoH) contribute to 80% of a patient's health outcomes, yet most medical students receive little to no training on addressing them; instead focusing on a biomedical model of disease. In a needs assessment of DH-LIC students, 66% of students reported low confidence in working with communities to find solutions to their self-identified problems related to SDoH. Based on these results, an innovative service learning curriculum was developed with the objectives to increase medical student teamwork, community engagement, and understanding of SDoH.

SETTING AND PARTICIPANTS: The University of Colorado School of Medicine's DH-LIC is a year-long clerkship in which 10 medical students complete all core clerkships in a longitudinal, integrated experience at Denver's safety net hospital.

DESCRIPTION: This innovation consists of a multimodal curriculum woven into the DH-LIC, including didactic sessions focused on SDoH, community windshield surveys and case investigations, team dynamics workshops, written reflections with group discussion, and the development of a longitudinal service project in collaboration with community partners.

EVALUATION: Pre-curricular surveys assessed student values and attitudes surrounding leadership, community engagement, altruism, and confidence in addressing SDoH of their patients. Results showed students highly value community involvement, physician leadership, and altruism, with mixed results in confidence and experience in addressing SDoH. Post-curricular surveys will be administered to students with results to be presented at the conference. Additionally, community partners will be surveyed about impact of service projects and student characteristics and interactions with community members.

DISCUSSION / REFLECTION / LESSONS LEARNED: A service learning curriculum proved to be a powerful tool to introduce students to experiential learning around community engagement and organizing, teamwork, leadership, and the influence of SDoH on individual and community health outcomes. Students reflected on the roles of physicians in communities and felt empowered by their partnerships with community members. Workshops with facilitated reflection focused on team dynamics and leadership led to powerful discussions among students and pushed students to expand their roles outside of comfort zones leading to personal and professional growth.

DEVELOPMENT AND IMPLEMENTATION OF A PRE-CLINICAL LGBTQ+ HEALTH ELECTIVE

Uriel Kim²; Eric Chen²; Megan McNamara¹. ¹Louis Stokes Cleveland VAMC, Cleveland, OH; ²Case Western Reserve University School of Medicine, Cleveland, OH. (Control ID #3186565)

NEEDS AND OBJECTIVES: Despite the documented healthcare barriers and disparities of LGBTQ+ individuals, there is often little medical school curricular emphasis on the topic. The main objective of the LGBTQ+ Health Elective is to provide learners with a 360-degree, "whole person" perspective of LGBTQ+ health through multidisciplinary lectures and shadowing experiences.

SETTING AND PARTICIPANTS: Fourteen second year medical students from Case Western Reserve University School of Medicine (CWRU-SOM) participated in the elective.

DESCRIPTION: This zero-credit, pre-clinical elective met for three hours every other week over the course of a semester. Key strengths of the elective include the implementation of national curricular guidelines from the AAMC, multi-disciplinary lectures, multi-disciplinary and clinical shadowing experiences. The lectures were delivered by physicians, social workers, sociologists, and other allied health professionals, and covered topics including the Social Determinants of LGBTQ+ Health, Gender Affirmation Surgery, Spirituality, and the Sociology of Sexuality. Students were required to complete three shadowing experiences, each four hours long. Students shadowed either a social worker or psychologist at least once. The shadowing experiences occurred at LGBTQ-focused Clinics at the Louis Stokes Cleveland VA Medical Center and the Cleveland Clinic Foundation.

EVALUATION: For the program evaluation, we asked learners to complete a "minute paper," a validated quality improvement instrument, after each lecture. We also asked learners to quantitatively assess their clinical shadowing experiences and their preceptors. For the student evaluation, we administered a validated, LGBTQ+ health-specific pre/post survey consisting of 16 likert-scale questions. Additionally, at the conclusion of the elective, students completed a brief, 55-word, reflective practice exercise.

DISCUSSION / REFLECTION / LESSONS LEARNED: To our knowledge, this elective is the among the most comprehensive pre-clinical curricula for LGBTQ+ Health. The results of the pre/post survey demonstrate improvement in domains of "knowledge," "attitudes," and "experiences." The average standardized mean differences between the pre and post samples (N=13) for

the 5 knowledge questions, 6 attitudes questions, and 5 experience questions were 0.23, 0.37, and 0.19, respectively. Secondary benefits of the elective include elevating the importance of LGBTQ+ Health in the medical curriculum and the opportunity to knit together LGBTQ+ providers and allies at CWRU-SOM's various clinical affiliates.

DEVELOPMENT AND INITIAL EVALUATION OF COMMUNITY HEALTH CURRICULUM IN AN INTERNAL MEDICINE RESIDENCY PROGRAM: YEAR ONE

Rachael W. Hayes¹; Jennifer Adams²; Lisa Altshuler²; John Martin¹. ¹NYU Langone Brooklyn, New York, NY; ²NYU School of Medicine, New York, NY. (Control ID #3175501)

NEEDS AND OBJECTIVES: In the changing landscape of healthcare, physicians must be adaptive, visionary and evidence-based in their approach to care. Medical education must be adjusted to allow learners to gain skills that prepare them to function effectively in this new paradigm. In order to meet these needs, we developed a community based curriculum with emphasis on transitions of care, population health and innovation of care.

SETTING AND PARTICIPANTS: Curriculum was developed as part of a new NYU Internal Medicine Residency Community Health Track, housed at NYU Langone Hospital- Brooklyn, a community based, academic teaching hospital. Ambulatory training is based at the Family Health Centers at NYU Langone, a network of FQHCs. Both the hospital and FQHCs serve a vulnerable, diverse community in south Brooklyn. To date we have recruited one class of 10 interns. As of July 2020 we anticipate having a full track consisting of 30 residents.

DESCRIPTION: Our first year curriculum aims to develop a framework for thinking about community health introducing key concepts such as population-based care, novel delivery of care, and interdisciplinary collaboration. Early in their training, residents completed a community assessment using observational data, interviews and census track data. These assessments paired with collaboration with CHW and community organizations gave them first hand exposure to our area's specific challenges and gaps in care. The residents began to develop skills in home care by working with an interdisciplinary team of doctors, nurses and CHWs. Additionally, they participated in a transitions of care workshop, examining their own hospital patients who had been readmitted and identifying best practices for hospital discharge.

EVALUATION: A multi-method evaluation plan is essential as we evaluate and strengthen the curriculum. Qualitative feedback is gathered at regular intervals throughout the year along with surveys of trainees. Initial results suggest that curricula is well-received by residents. Aggregated longitudinal educational data including resident self-report, 360°evaluations and performance-based assessment, (OSCEs, USP visits) will contribute to program evaluation. The most important outcome will be how these trainees practice once they have graduated. We plan to use post-graduate surveys to judge the impact of the curriculum.

DISCUSSION / REFLECTION / LESSONS LEARNED: We adapted curriculum to focus on our particular community and created innovative programs to improve the population's health. Essential to these accomplishments was our partnership with learners and our reliance on their feedback to guide curriculum development. Allowing trainees to explore their interests has lead to visionary projects. We have learned that by being flexible and adapting to the learners' needs and interests we can serve our community in deeper ways than we had initially anticipated. However, structural limitations of the clinic coupled with institutional changes resulted in a slower time frame for clinical adaptations.

DEVELOPMENT AND PILOT TESTING OF A TOOL TO IMPROVE GENERIC ORAL CONTRACEPTIVE PILL PRESCRIBING

Gena Lenti¹; Hannah Wilson³; Jen Rusiecki¹; Vineet M. Arora². ¹University of Chicago, Chicago, IL; ²University of Chicago Medical Center, Chicago, IL; ³University of Chicago Pritzker School of Medicine, Chicago, IL. (Control ID #3185697)

NEEDS AND OBJECTIVES: Brand and generic oral contraceptives (OCPs) are therapeutically equivalent, but generics still tend to be under-prescribed. In order to assess barriers to generic OCP prescription, a needs assessment was conducted using focus groups and surveys completed by Primary Care Providers and Nurse Practitioners at American College of Physicians Internal Medicine and American Association of Nurse Practitioners Annual Meetings. Focus groups identified confusion about generic naming as a barrier to prescription. One participant stated, "If you're going to generically prescribe an oral contraceptive...you're going to have to go in there and be savvy enough to be able to ask for that drug based on the generic drug equivalents that are in it." Based on focus group and survey findings, our objective was to develop and test a clinical tool to facilitate generic OCP prescription.

SETTING AND PARTICIPANTS: Following development, our tool was disseminated among residents, attendings, and APN's in the University of Chicago Primary Care Group (PCG), and focus groups and surveys were used to explore usefulness and gather feedback on the tool.

DESCRIPTION: Our tool consisted of a pocket card designed to clarify OCP nomenclature. The front of the card included benefits of generic medications to be communicated to patients as well as a description of how to use the card. The back of the card comprised of a table of specific types of branded OCPs and their generic equivalents, matched based on estrogen (dose) and progestrone (type and dose) components. The medication types listed in the table were drawn from the University of Chicago PCG most frequently prescribed OCPs, and the card was reviewed by University of Chicago pharmacists and primary care leaders.

EVALUATION: Surveys completed before dissemination of the pocket card indicated 63% (n= 38) of participants found the naming of OCPs to be confusing, 74% reported they do not discuss switching to generic OCPs, and 58% were not confident prescribing OCPs without a tool. Provider knowledge of generic OCPs was low, indicated by the fact that 85% and 50% were able to correctly identify Yaz and Ortho-cyclen as brand OCPs, yet only 45% and 29% were able to identify Sprintec and TriNessa as generic. Following dissemination, 100% agreed that the pocket card was understandable, and 89% said the pocket card would be useful in clinical practice. Feedback for improvement of the tool included presence of drug prices, identification of common "go-to" varieties, development of an OCP algorithm, and creation of an online version.

DISCUSSION / REFLECTION / LESSONS LEARNED: Nomenclature of generic OCPs is confusing and this creates a barrier to generic prescription. An educational tool such as ours may help to fill this knowledge gap among OCP prescribers. In the future, we would like to develop a post-survey for participants to complete after integrating the card into their clinical workflow and to conduct a similar assessment with other physicians who prescribe OCPs, such as obstetrician-gynecologists.

ONLINE RESOURCE URL (OPTIONAL): <https://bit.ly/2VZWZ4P>

DEVELOPMENT AND TESTING OF A WEB MODULE TO IMPROVE GENERIC PRESCRIBING OF ORAL CONTRACEPTIVES AMONG INTERNAL MEDICINE PHYSICIANS

Gena Lenti¹; Jeanne M. Farman¹; Arlene Weissman³; Michelle L. Cook⁴; Marilyn Stebbins⁸; Christopher Moriates⁵; Shalini S. Lynch⁸; Anita Samarth⁹; James X. Zhang⁶; September Wallingford⁷; Neel Shah¹⁰; Samantha Ngooi¹; David Meltzer¹; Vineet M. Arora². ¹University of Chicago, Chicago, IL; ²University of Chicago Medical Center, Chicago, IL; ³American College of Physicians, Philadelphia, PA; ⁴American Association of Nurse Practitioners, Austin, TX; ⁵Dell Medical School at The University of Texas, Austin, Austin, TX; ⁶The University of Chicago, Chicago, IL; ⁷Costs of Care, Quincy, MA; ⁸University of California San Francisco, San Francisco, CA; ⁹Clinovations Government and Health, Washington D.C., DC; ¹⁰Harvard Medical School, Boston, MA. (Control ID #3185575)

NEEDS AND OBJECTIVES: Use of generic oral contraceptives (OCPs) can improve medication adherence and reduce healthcare costs for patients, yet skepticism of generic drugs remains a barrier to generic OCP prescription. Generic skepticism, defined as lack of agreement that generic drugs are as effective as, as safe as, or do not cause more adverse events than brand counterparts, persists among clinicians in many fields and is associated with less willingness to discuss and prescribe generic drugs. While several strategies to reduce generic skepticism and increase generic prescribing have been attempted, none have targeted use of OCPs specifically. An educational web module was developed to reduce generic skepticism related to OCPs, improve knowledge of generic drugs, and increase willingness to discuss and prescribe generic OCPs among physicians.

SETTING AND PARTICIPANTS: A baseline survey assessing generic skepticism and prescription of generic drugs was disseminated via email to an ACP research panel. Eligibility criteria selected for physicians specializing in internal medicine and those who spend greater than 50% of time in patient care. The module was sent to physicians who completed this baseline survey.

DESCRIPTION: Kern's six step approach to curriculum development was used to develop a generic OCP web-module. A primary needs assessment was completed using focus groups at American College of Physicians (ACP) Annual meetings and a survey targeting baseline generic skepticism. Insights gained from needs assessments were used to build an educational web module discussing benefits to generic OCP prescription. Post-module evaluation assessed learner reaction, knowledge, intention to discuss and prescribe generic OCPs, and changes in generic skepticism.

EVALUATION: The module had a response rate of 56% (n=208/369). Individuals defined as generic skeptics at baseline were significantly less likely to complete our module compared to non-skeptics (responders 9.6% vs. non-responders 16.8%, p=0.04). The majority (85%, n=17/20) of baseline skeptics were converted to non-skeptics (p<0.01) following completion of the module. Compared to non-skeptics, post-module generic skeptics reported less willingness to discuss (skeptic 33.3% vs. non-skeptic 71.5%, p<0.01), but not less willingness to prescribe generic OCPs (skeptic 53.3% vs. non-skeptic 67.9%, p=0.25). Non-white physicians and international medical graduates (IMG) were more likely to be generic skeptics at baseline (non-white 86.9% vs. white 69.9%, p=0.01,

IMG 13.0% vs. USMG 5.0% vs. unknown 18.2%, p=0.03) but also more likely to report intention to prescribe generic OCPs as a result of the module (non-white 78.7% vs. white 57.3%, p<0.01, IMG 76.1% vs. USMG 50.3% vs. unknown 77.3%, p=0.03).

DISCUSSION / REFLECTION / LESSONS LEARNED: Our study demonstrated an effective way to promote generic medications and educate providers using a brief web module disseminated on a national scale. Future interventions such as ours should target groups with low knowledge of generic drugs as well as those with high generic skepticism.

DEVELOPMENT OF A MEDICAL STUDENT CLINICAL ELECTIVE FOCUSING ON HEALTH EQUITY: "EXPLORING SOCIAL DETERMINANTS OF HEALTH AT AN URBAN COMMUNITY HOSPITAL." A LOOK AT IMPACTS ON STUDENT ATTITUDES AND READINESS TO SERVE A DIVERSE PATIENT POPULATION.

Amanda Ramsdell. Weill Cornell Medical College, New York, NY.
(Control ID #3164992)

NEEDS AND OBJECTIVES: The importance of health equity is gaining awareness throughout every level of the healthcare system. Medical providers bear witness to some of the most severe downstream effects of health inequity in a community. Serving our patients involves taking a closer look at the root cause of disease and health disparities long before a patient enters the hospital. How we address these upstream factors in our clinical practice is evolving, and the question of how we explicitly teach our approach to medical students in the clinical setting needs to be explored. Our goal is to allow medical students the time to focus on and explore these issues through both lectures and real-time clinical encounters. In doing so, we hope to reinforce the importance of social determinants of health in their future practice of medicine.

SETTING AND PARTICIPANTS: Students qualify to take this elective after having completed the core clinical clerkships in internal medicine, pediatrics and family medicine, which typically occurs during their third or fourth year. The clinical portion of the elective involves patients admitted to the Hospitalist service, referred by Hospitalist providers.

DESCRIPTION: The core experience of the course centers around student interviews of patients at the bedside, exploring the patients' experience and discussing prior history and root causes of disease and wellness. Working backwards from this knowledge, the students and preceptor explore upstream factors of observed downstream outcomes. Elective team then presents information to the primary inpatient team, and brainstorms current actionable interventions. Topics of didactics include relevant areas related to housing, immigration, implicit bias involving race and incarceration which are common areas of concern for many of our patients. Learning is reinforced by targeted field visits to housing/homelessness advocacy groups, methadone clinics and community centers. Continued discussions extend to our patients' political determinants of health and areas of opportunity for advocacy as physicians.

EVALUATION: IRB approval pending for upcoming students for qualitative research project, details to be determined.

DISCUSSION / REFLECTION / LESSONS LEARNED: While Health Equity is often addressed in the pre-clinical years explicitly, modeling addressing these important factors into real-time clinical work remains largely implicit and dependent on the attending of service for most medical students. Explicitly speaking about health equity in the clinical setting is often lacking at many levels of medical training (i.e. medical students, Physician Assistants, and Attendings.) During our pilot

elective, students appreciated being able to directly focus on these factors and felt they added value to the primary clinical team. The preceptor and medical team on service also benefited from greater explicit communication about social determinants of health and considering broader systems based interventions that may be of benefit to their patients in the longer term.

DEVELOPMENT OF AN EVALUATION FRAMEWORK FOR COMMUNITY HEALTH WORKERS IN A MEDICAID ACO

Salina Bakshi^{2, 3}; Kayt Kitt⁴; Sarah Oo⁵; Danelle Marable⁵; Maryann Vienneau⁴; Amy O. Flaster^{1, 4}. ¹Brigham and Women's Hospital, Brookline, MA; ²Massachusetts General Hospital, Boston, MA; ³Harvard Medical School, Boston, MA; ⁴Partners Healthcare, Boston, MA; ⁵Massachusetts General Hospital, Chelsea, MA. (Control ID #3186004)

NEEDS AND OBJECTIVES: 1) To learn how to leverage and implement a community health worker (CHW) model to assist in managing patients' social determinants of health (SDOH) needs. 2) To develop key performance indicators to ensure the operational success and to support the evaluation of a CHW model. 3) To encourage the continued use of CHWs as a resource supporting the success of a Medicaid Accountable Care Organization model.

SETTING AND PARTICIPANTS: This study was an observational quality assessment completed by Partners Healthcare, a health system located in Boston, MA. This assessment was conducted at two academic medical centers, specifically Massachusetts General Hospital and Brigham and Women's Hospital, both in Boston, MA. The participants included CHWs hired by both institutions and the Partners Community Health Worker Executive Committee.

DESCRIPTION: One of the great imperatives in patient education is to develop superior methods of educating patients on their condition and to better empower patients to improve their health. Community Health Workers (CHWs) are a potential solution to this challenge. CHWs are public health workers who can help provide and augment the care received by patients. Their roles include, but are not limited to, patient outreach and education, cultural mediation, providing direct patient services, and patient advocacy. CHWs have previously been demonstrated to reduce barriers to healthcare while simultaneously decreasing medical spending and unneeded healthcare utilization. However, there is no consensus framework detailing the key operational metrics for the work done by CHWs, and the metrics organizations should employ in evaluating their own CHW programs.

EVALUATION: Herein, we propose a series of metrics that seek to critically and comprehensively assess CHW performance. These metrics include (1) CHW workflow (2) average interactions per patient per month (3) methods of contact with patients (face-to-face, telephone, etc.) and (4) type and number of contacts per CHW per month. Furthermore, we plan to tie these metrics to relevant clinical outcomes, including ED visits, primary care physician (PCP) visits, primary care no-show rate, and total medical expenditure.

DISCUSSION / REFLECTION / LESSONS LEARNED: These metrics have been internally piloted and validated. Collectively, we feel the outlined framework of metrics can provide a structure for operational oversight of CHWs, as well as criteria for evaluating the impact of a CHW within an ACO setting. They are generalizable and may be readily repurposed for implementation within other health systems.

DISABILITY AND ABLEISM IN MEDICINE: A CURRICULUM FOR FIRST-YEAR MEDICAL STUDENTS

Hannah M. Borowsky¹; Leora Morinis¹; Megha Garg². ¹University of California San Francisco, San Francisco, CA; ²San Francisco VA Medical Center, University of California San Francisco, San Francisco, CA. (Control ID #3186092)

NEEDS AND OBJECTIVES: By the end of this session, students will:

1. Explain possible influences of disability on patient health and clinical encounters
2. Compare and contrast the medical and social models of disability
3. Discuss the meaning and manifestations of ableism
4. Recognize the ways in which ableism contributes to health and health care disparities
5. Brainstorm solutions through which medical communities can address ableist norms and practices
6. Reflect on their relationship to disability and how it could impact their future clinical practice

SETTING AND PARTICIPANTS: We designed and implemented a 2-hour course for all UCSF first-year medical students, divided into groups of 12, with one faculty-facilitator. The session is now a permanent part of the UCSF Bridges Health and the Individual block, a three week course dedicated to social and behavioral foundational sciences.

DESCRIPTION: Founded on the belief that medical education can provoke personal, professional, and systemic change, we developed a "Disability and Ableism in Medicine" curriculum to offer medical students a new lens through which to understand themselves and their future patients. Our small group session was designed to equip students with tools to care for patients with disabilities and to identify ableism—a worldview that values autonomy, and perceives disabilities as deficits to be ideally overcome. We included four key activities: (a) norm-setting; (b) student-led group presentations on: health and healthcare disparities, disability history and policy, disability and intersectionality, and disabilities amongst medical professionals; (c) brainstorm of interventions for overcoming healthcare barriers and biases; (d) privilege awareness exercise. The course materials acknowledged that members of the UCSF community have disabilities and that medical school has historically been a difficult environment in which to be open about them.

EVALUATION: The session's mean value was 4.58 on a 5-point scale (n=45 students). A pre- and post-session paired-sample t-test (n=17) indicated significant increases in students' self-reported understanding of ableism ($p=0.002$) and confidence in assessing barriers to care for patients with disabilities ($p<0.001$). Faculty facilitators reported that the session provoked powerful student-centered learning, leadership, and widespread participation.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our curriculum on disability and ableism introduces a crucial topic often absent from medical training. By drawing on input from disability scholars, community members, and advocates in the design of this curriculum, students encountered perspectives not always included in medical education. These perspectives prompted students to connect individual experience to structural determinants, spurring new thinking about medicine and advocacy. Being second-year medical students at the time we developed the curriculum also greatly influenced the way we structured our course, illustrating the ways in which near-peer curriculum development can uniquely address certain educational needs.

DOCUMENTATION OF LEARNING OUTCOMES TO GRANT MAINTENANCE OF CERTIFICATION CREDIT FOR PARTICIPATION IN MORBIDITY AND MORTALITY CONFERENCE

Kelly A. Kieffer^{1, 2}; Harley Friedman^{1, 2}. ¹Dartmouth-Hitchcock Medical Center, Lebanon, NH; ²Geisel School of Medicine at Dartmouth, Lebanon, NH. (Control ID #3180179)

NEEDS AND OBJECTIVES: Morbidity and Mortality Conference (M&M) can provide a positive environment for discussion of unexpected negative outcomes and medical error, and can incorporate learning related to the clinical content of a case, the diagnostic reasoning process, and strategies to promote patient safety. Continuing Medical Education (CME) providers offering credit for M&M can also offer Maintenance of Certification (MOC) credit through a 2015 collaboration of the American Board of Internal Medicine (ABIM) and the Accreditation Council of Continuing Medical Education (ACCME). Granting MOC requires a formative assessment process including feedback, which can be challenging in the context of a large group interactive format.

SETTING AND PARTICIPANTS: Internists enrolled in ABIM MOC who participate in the Department of Medicine Morbidity, Mortality and Improvement conference at Dartmouth-Hitchcock Medical Center in Lebanon, New Hampshire.

DESCRIPTION: We developed MOCME, an assessment process incorporating a web-based tool that uses only open source resources. The tool enables physicians to document learning outcomes, receive feedback, and earn MOC credit. Users log in after each M&M conference, complete an evaluation, and reflect on what they learned and how it will change their practice. The conference facilitator reviews all entries, assesses MOC eligibility, and enters a summary of key learning points that is emailed to participants. A report of MOC eligible physicians is routed to the institutional CME office for submission to the ACCME.

EVALUATION: In 15 months, 518 of 525 MOC requests by 53 physicians were approved; 7 were declined due to insufficient quality of reflective statements regarding participants' learning. A median of 3 points were approved per physician. 84% of respondents to an anonymous survey felt that the system is easy to use and 86% reported being satisfied with it. 65% agreed that the engaging with MOCME reinforced their learning from M&M. Most respondents take an average of 5 minutes or fewer to complete the process. MOCME added minimal administrative burden for the facilitator.

DISCUSSION / REFLECTION / LESSONS LEARNED: MOCME is a user-friendly system that meets ABIM's guidelines for granting MOC for CME. The system could be adapted for other institutions and other types of Regularly Scheduled Series. Further study is needed to identify factors that influence participants to utilize the system and to measure long term learning outcomes and impact on practice. The content of MOCME participants' self-identified learning outcomes provides valuable insight to the facilitator that will inform improvements in the structure and content of the conference to better meet participants' needs.

DOES A PERSONAL EXPERIENCE INFLUENCE RECOMMENDATIONS BY PRECLINICAL MEDICAL STUDENTS? EFFECTS OF A VIRTUAL DEMENTIA SIMULATION

Arati Kelekar¹; Nelia Afonso². ¹Oakland University William Beaumont School of Medicine, Huntington Woods, MI; ²Oakland University William Beaumont school of Medicine, Rochester, MI. (Control ID #3164035)

NEEDS AND OBJECTIVES: When faced with clinical decisions, learners with limited experience tend to be linear thinkers and focus mainly on single problems. The objective of this project was to evaluate the influence of a personal experience by preclinical students in a simulated setting on: - the recognition of the multidimensional nature of clinical problems - identification of potential solutions and - provision of patient centered care.

SETTING AND PARTICIPANTS: The Virtual Dementia Tour (VDT)® is a simulation-based sensitivity training program for health care providers to the plight of patients with dementia. This project received IRB approval.

DESCRIPTION: Prior to the VDT® experience preclinical students documented a management plan for an 86-year-old with dementia presenting with uncontrolled hypertension. Following the 8-minute VDT® simulation, students submitted a reflection on their experience and were allowed to modify their original plan. Qualitative research methods using grounded theory were used to gain insights from student comments on recognition of the multidimensional nature of the problem and the effect on their treatment plans.

EVALUATION: Of the 117 students who experienced the VDT®, 101 completed the assignment. Pre VDT® Prior to the experience 60% of students focused on pharmacologic management, 28% addressed care-giver issues. VDT® reflections Common themes and sample statements identified in the reflections included: Emotional/physical discomfort "The biggest challenge was hearing/interpreting/communicating with others. The sensory overload is something that I will never forget" "It's scary. Even the temporary experience was unbearable..." "Feeling rushed by others, feeling abandoned, a large sense of frustration, ... I was unable to make sense of what was around me" Experience of challenges faced by patient Dementia is much more than just memory loss "... gave the unique insight as far as how a person with dementia experiences problems" Empathy I could understand better if someone with dementia reacted with anger or frustration or exhaustion knowing that they deal with this every day" Modification of communication behaviors I would take extra time to address their frustrations. Give more time and support. Check for understanding. Provide written and verbal instructions. Insight I always isolated dementia from other sensory modalities of the body. I did not understand the extent of emotional changes the patient goes through on a day to day basis. Post VDT A majority of students amended their original plans to include various non-pharmacologic strategies such as caregiver assistance (33%), assistive devices and environmental modifications (33%).

DISCUSSION / REFLECTION / LESSONS LEARNED: The VDT® simulation resulted in increased empathy and insight into the struggles faced by patients with dementia as evidenced by the reflections noted by the preclinical students. Additionally, it resulted in a modification of their management plans to include consideration of home environment and assistance requirements.

DON'T WAIT, ESCALATE!: IMPROVING RESIDENT PERCEIVED ESCALATION BARRIERS THROUGH A COMPREHENSIVE CURRICULUM

Stefanie Reiff¹; Lisa Altshuler²; Lisa Schwartz¹; Marwa Moussa¹. ¹NYU Langone Hospital - Brooklyn, Brooklyn, NY; ²NYU Medical Center, New York, NY. (Control ID #3142840)

NEEDS AND OBJECTIVES: Residents often fail to escalate care due to uncertainty resulting in delays of care and possible harm. Multiple studies have identified trainee self-reported barriers to escalation, but none have evaluated the impact of a multi-faceted curriculum aimed to reduce perceived escalation barriers. Our objective was to identify, address, and improve residents' perceived barriers to escalation.

SETTING AND PARTICIPANTS: This study was conducted at an urban, academic medical center within the Internal Medicine residency program over one year.

DESCRIPTION: A baseline Likert-scale survey categorized residents' perceived escalation issues. A four-lecture curriculum about common causes of patient deterioration and an objective structured clinical examination (OSCE) were created to address the found issues. In the OSCE PGY1 residents first entered the room with the option to escalate to a PGY2 or a PGY3 acting as the rapid response team (RRT) leader with an attending physician creating pushback/intimidation throughout. Debrief focused on both knowledge and

collapsing hierarchies. A retrospective pre-post Likert-scale survey evaluated for change in resident attitudes after the interventions in three areas: Communication Skills, Awareness/proper knowledge base of the problem, and Self-assertiveness/handling intimidation from superiors.

EVALUATION: A total of 54/77 of IM residents completed the baseline survey. Only the PGY1,2 received intervention, and 34/54 completed the pre-post survey. Baseline survey results Identified barriers included feeling intimidated when escalating (33% rated this as at least a fairly common problem), feeling pushback when escalating (31%), worrying others will view them negatively (10%), gaps in knowledge (12%)/awareness (32%), and misunderstanding severity of the problem (11%). Retrospective Pre-Post Results Paired t-tests were conducted on pre and post summary scores. All post-intervention summary scores rose compared to pre scores, and the Awareness scale approached significance ($p=.08$). The seven most targeted questions were examined using Wilcoxon Sign tests. Three questions showed statistically significant improvement: improved frequency of being told information needing escalation ($p=0.004$), less feelings of self-blame ($p=0.035$), less limitation of autonomy with mandatory RRTs ($p=0.009$). The other four questions including comfort with, worries about repercussions for, feeling intimidated about, and viewing self negatively if needing to escalate showed change in the positive direction without reaching statistical significance.

DISCUSSION / REFLECTION / LESSONS LEARNED: This study demonstrates the implementation of a year-long curriculum and OSCE can lead to significant change in resident attitudes about perceived escalation barriers. It is likely this study was hindered by a small sample size due to the number of near-significant findings. Future studies are needed involving larger numbers of residents and looking at changes in RRT instances and outcomes to determine if clinical change accompanies the found perceptual change.

EDUCATING HEALTHCARE PROFESSIONALS ON THE EFFECTS OF INCARCERATION ON PATIENTS

Rachael Williams; Marya J. Cohen; Matthew Tobey. MGH, Boston, MA. (Control ID #3184019)

NEEDS AND OBJECTIVES: The U.S. incarcerates a greater proportion of its population than any other nation at a rate of 698 per 100,000.¹ Those involved in the criminal-legal system have a higher burden of chronic disease and mental illness compared to the general population.^{2,3} During the first two weeks following release from incarceration, the mortality rate of this population is 12.7 times that of the general population, with a 129 times increased risk for drug overdose.⁴ Formerly incarcerated patients (FIPs) have unique barriers to healthcare including missed appointments, insurance lapses and difficulty obtaining prescriptions upon release. Healthcare providers often lack training on how to care for FIPs. One study found that 42% of formerly incarcerated men experienced discrimination by healthcare workers. It is important for healthcare providers to be equipped to address the unique needs of FIPs in a sensitive manner.

SETTING AND PARTICIPANTS: This work is anchored in partnership between Massachusetts General Hospital's Crimson Care Collaborative-Nashua Street Jail (CCC-NSJ) and the Suffolk County Sheriff's Department (SCSD). CCC-NSJ is a student-faculty clinic located in a local jail where faculty from MGH teach health professions students in the correctional setting. Through a grant from the Massachusetts Medical Society Charitable Foundation, we have utilized our network of MGH faculty, CCC-NSJ volunteers, and SCSD staff to establish curricula for community clinics to improve the quality of care provided to FIPs.

DESCRIPTION: We have created two 1-hour educational sessions for healthcare professionals on the effects of incarceration. One session targets clinicians and the other staff. Topics include history of U.S. incarceration rates, recommended language use, opportunities to screen for incarceration, an overview of the health risks of incarceration and how to best practice trauma-informed care for this population.

EVALUATION: Surveys evaluating each session were distributed to providers following each of the first two sessions. Twenty-two responses were recorded. On a 5-point Likert scale, the mean session rating was 4.8/5 and the mean rating for the session's content was 4.8/5.

DISCUSSION / REFLECTION / LESSONS LEARNED: We received positive feedback from participants. Many respondents commented that this topic was new and necessary. One person noted, "I've never heard this information presented in the health center before." Respondents also mentioned that more time devoted to trauma-informed care would be helpful. Our team noted the conversations with physicians and staff differed. Some clinicians had theoretical knowledge of the topic, but staff had more lived experience. Staff members were able to relate multiple anecdotes of family members who had experienced health risks related to incarceration. Despite personal experience, staff described lack of professional empowerment to speak with patients on this matter. As we continue to develop teaching sessions, we will increase the length of sessions to allow more time to focus on trauma-informed care.

EFFECT OF GENDER ON ATTENDING PHYSICIAN'S FEEDBACK TO INTERNAL MEDICINE RESIDENTS: A QUANTITATIVE AND QUALITATIVE STUDY

Ana Sofia Warner; Nneka Ufere; Kerri Palamara. Massachusetts General Hospital, Boston, MA. (Control ID #3185760)

NEEDS AND OBJECTIVES: Residency is an important period of professional learning and growth for physicians-in-training. The Accreditation Council for Graduate Medical Education (ACGME) adopted the Milestones-based Next Accreditation System in 2013, which relies heavily on faculty evaluations of residents. While evaluations are an important aspect of resident professional development, the inherently subjective nature of these evaluation leaves room for implicit bias. To our knowledge, no contemporary data exists assessing for gender differences in faculty evaluations of internal medicine trainees using the ACGME milestones-based evaluations. We aim to use qualitative and quantitative methods to evaluate the impact of gender on internal medicine trainees' performance evaluations.

SETTING AND PARTICIPANTS: Data for this longitudinal, retrospective project will be collected from Massachusetts General Hospital internal medicine resident evaluations from the 2016-2017 academic year. This study is part of a larger multi-site study involving six internal medicine residency programs across the U.S.

DESCRIPTION: We will be collecting data from attending evaluation forms of internal medicine residents using the ACGME milestones-based evaluations. Each evaluation consists of written comments and quantitative scoring of residents across six clinical competency domains: patient care, medical knowledge, system-based practice, practice-based learning and improvement professionalism and interpersonal and communication skills.

EVALUATION: Our investigation involves analysis of both the quantitative and qualitative evaluation data. For the quantitative data, we will convert the rankings into numerical scores. For the qualitative analysis, we will examine the written comments by attendings of trainees.

DISCUSSION / REFLECTION / LESSONS LEARNED: At the MGH site, we have 1070 resident (68 female, 82 male) evaluations that were

completed by faculty (62 female, 99 male) during the 2016-2017 academic year. For our quantitative analysis, we will convert scores on the ACGME milestone-based performance scales to numerical scores for each trainee. We aim to compare the mean scores for each milestone domain between male and female trainees using t-tests and estimate associations of mean scores for each milestone domain with attending-trainee gender pairings using linear mixed effect models. For our qualitative analysis, we will use a multistage, multianalysis procedure for coding and analyzing the written feedback in the evaluations of trainees to categorize the content of these evaluations into groups according to broader issues or themes.

EMPOWERING RESIDENTS TO EXPLORE BARRIERS TO WELL-BEING: CREATION OF A WELL-BEING ELECTIVE

Chloe Ciccarello¹; Larissa Thomas². ¹University of California San Francisco, San Francisco, CA; ²University of California, San Francisco at Zuckerberg San Francisco General, San Francisco, CA. (Control ID #3179519)

NEEDS AND OBJECTIVES: The drivers of physician well-being are complex and involve cultural, organizational, and individual components. To address this, we created a Well-being Elective, the objective of which is to allow residents to explore cultural and structural drivers of physician well-being, as well as possible interventions.

SETTING AND PARTICIPANTS: At the UCSF Internal Medicine Residency, we have had a Well-being Committee comprised of resident physicians who meet monthly to design interventions to improve the resident experience, but resident ability to work on these projects has been limited by the lack of protected time. Through advocacy within the Internal Medicine Residency, we were able to create a Well-being elective that is available to third year internal medicine residents on their ambulatory rotations.

DESCRIPTION: The residents spend 2-3 half days per week on the elective over one month; time is split three ways. The main focus of the elective is completion of a deep-dive project that is focused on a cultural or systems aspect of physician well-being, aligned with the commitments of the Charter on Physician Well-being. They also prepare a well-being case conference, focused on an emotionally challenging patient care experience and its impact on the care team. Finally, the residents participate in mentorship and skill-building activities happening at the medical center.

EVALUATION: There was widespread interest in the elective; 9 residents will complete the elective in 2018-19. To date, residents have completed projects across a breadth of organizational well-being priorities. Residents prepare reports summarizing their findings, which are presented at program leadership meetings, and two-thirds of residents have successfully submitted their projects as innovation abstracts to scholarly meetings. Long-term follow-up is planned to assess programmatic changes implemented as a result of these projects.

DISCUSSION / REFLECTION / LESSONS LEARNED: Residents are interested in well-being as a field of study, and providing protected time for residents to study this places it as equally important to other academic endeavors. Residents have much to offer programs, if given the time and resources to study drivers of well-being.

ENHANCING CLINICAL SKILLS DEVELOPMENT THROUGH A LONGITUDINAL CROSS-CLERKSHIP CLINICAL SKILLS EXAM

Kristy Y. Kosub¹; Kevin Schindler¹; Diane Ferguson². ¹UT Health San Antonio, San Antonio, TX; ²UTHSCSA, San Antonio, TX. (Control ID #3185531)

NEEDS AND OBJECTIVES: Assessment of clerkship students' clinical skills is frequently based upon faculty/resident evaluations. Direct observation is challenging¹ and evaluations are frequently unreliable^{2,3}. We designed a longitudinal objective structured clinical examination series, the Cross-clerkship Clinical Skills Exam (C3SE) to improve observation/feedback. We hypothesized that multiple formative skills evaluations would augment early intervention with struggling learners and Step 2CS preparation. The C3SE replaced our traditional senior year Clinical Skills Exam (CSE).

SETTING AND PARTICIPANTS: Exams are administered to all students in core clerkship year.

DESCRIPTION: Multiple clerkship directors, evaluation specialists, clinical skills center directors and standardized patient (SP) educators reviewed the school of medicine and clerkship competencies and created milestones for each C3SE. Balancing the number of competencies for evaluation and student/ skills center time, we developed three exams with four SP encounters each. Cases had diversity of patient ages, genders, and medical conditions to assess competencies for interpersonal skills, interviewing, physical examination, note documentation, and clinical reasoning. We developed a remediation exam for students who did not meet milestones. Assessment tools for each case were designed. SPs were trained for role portrayal and assessment tool accuracy. Student surveys were administered after each exam.

EVALUATION: We successfully implemented the C3SE during AY17-18. Post-C3SE surveys revealed students felt confident in improvement in history-taking, physical examination, clinical reasoning, note writing, and communication skills (average response: C3SE1 = 3.1, C3SE2 = 3.0, and C3SE3 = 3.1 on 4-point Likert scale). Results did not decline throughout the year despite increasing case complexity. Periodic assessments allowed faculty to identify struggling students (n=20 of 219).

DISCUSSION / REFLECTION / LESSONS LEARNED: Periodic structured observation and feedback may provide sustained clinical skills development and focused Step 2CS preparation. Score comparison from cases used in previous CSE was surprisingly equivalent no matter when cases appeared on C3SE schedule. Replacement of CSE with C3SE assessments allowed students to enroll in Step 2CS earlier than past years and more effective use of the skills center. We are closely monitoring Step 2CS results for effect on pass rates. Development of a complex examination requires significant resources, so support from clerkship personnel and UME Deans is vital to successful implementation.

ENHANCING TRAINEE EDUCATION AND PRACTICE THROUGH COMMUNITY PARTNERSHIPS: BUILDING AN INTERDISCIPLINARY, INTERPROFESSIONAL COMMUNITY HEALTH TRACK

Mariecel Pilapil¹; Johanna Martinez²; Lauren Block²; Daniel J. Coletti²; Barbara Keber⁶; Celia Lu³; Julie DiGregorio⁴; Alice Fornari⁵. ¹Zucker School of Medicine at Hofstra/Northwell, New Hyde Park, NY; ²Northwell Health, Lake Success, NY; ³St. John's University College of Pharmacy & Health Sciences, Lake Success, NY; ⁴Northwell Health, Huntington Station, NY; ⁵Northwell Health, Great Neck, NY; ⁶Zucker School of Medicine at Hofstra/ Northwell, Hempstead, NY. (Control ID #3181815)

NEEDS AND OBJECTIVES: Achieving health equity is critical to medical training, particularly in the primary care specialties of internal medicine (IM), family medicine (FM), and pediatrics. The Institute for Healthcare Improvement proposes addressing social determinants of health (SDH) and developing community partnerships as two key components to achieving health equity. However, training in these skills is lacking in medical residency and nurse practitioner (NP) curricula. We developed an interdisciplinary, interprofessional track that provides a longitudinal community health experience for trainees.

SETTING AND PARTICIPANTS: Faculty from IM, FM, and pediatrics planned and launched our health system's first multidisciplinary community health track in July 2018. The initial cohort for the 2018-2019 year included 8 trainees: 2 pediatric residents, 2 IM residents, 2 FM residents, and 2 NP students.

DESCRIPTION: In 2016, through a professional development grant, faculty in IM, FM, and pediatrics identified the need for improved community health training among residents. The ENHANCE track (ENgaging in Health Advocacy through Neighborhood Collaboratives and Education) was developed with the vision of developing trainee skills in population health and community engagement. The goals are to teach trainees how to: (1) Evaluate SDH and address their interplay with illness, (2) Partner with community-based organizations (CBOs), (3) Develop, implement, and evaluate a longitudinal, community-based project that addresses a population health need evident from their CBO partnership, and (4) Work collaboratively with professionals across disciplines. These goals are met through workshops, online webinars, CBO visits, and a collaborative health-related project. Mentoring and communication between trainees and faculty also occurs through group chats using the social media platform *What's App*.

EVALUATION: The ENHANCE track evaluation plan includes: post-workshop reflective evaluations from trainees and faculty, analysis of resident comments about their CBO visits during *What's App* conversations, focus groups on trainee experiences of the track, and surveys to CBO partners. Long term evaluation will be an assessment and dissemination of their community based scholarly project. To date, trainee reflections suggest an increased understanding of the barriers patients face, evidence of SDH, and the risks of implicit biases.

DISCUSSION / REFLECTION / LESSONS LEARNED: Development of an interdisciplinary community health track for residents and NP students is needed and feasible. Trainees can integrate classroom skills, apply them through service learning experiences, and incorporate lessons learned into their own clinical practice. Establishing trust between trainees and their CBO partners can be difficult due to trainee schedules, resulting in spaced visits to the CBOs. This demonstrates a challenge of community-based work. In addition, trainees report a perceived tension between their roles as traditional volunteers and as medical professionals able to provide expertise.

EPAS TO COMPETENCIES: A ONE DAY SUB-INTERNSHIP PREPARATORY EXPERIENCE TO BRIDGE THE GAP

Irsik J. Anderson¹; Jeanne M. Farnan²; Diane Altkorn². ¹University of Chicago Hospitals, Chicago, IL; ²University of Chicago, Chicago, IL. (Control ID #3177909)

NEEDS AND OBJECTIVES: In early 2018, the AAIM Sub-internship Task Force published its revised Internal Medicine Sub-internship Core Curriculum 2.0 in direct response to an IM residency program director survey. Program directors identified four core skills expected of new interns: recognizing sick vs. non-sick patients, knowing when to ask for assistance, managing time wisely, and communicating effectively within healthcare teams. Only the first and fourth skills align the AAMC EPAs with ACGME Sub-

competencies. Given the short duration of sub-internship experience as well as competing responsibilities, it is unlikely sub-interns will be exposed to much of the proposed core curriculum. In response, we created a one-day Sub-internship Preparatory Course to cover core curricular material as well as to address topics that are often not formally covered during the clinical years.

SETTING AND PARTICIPANTS: All third-year medical students were invited to enroll and attend the one-day preparatory course approximately one month prior to starting their fourth year clinical work. All students who attended the Prep Day received course credit.

DESCRIPTION: A one-day preparatory experience was designed to address topics not often formally addressed in M4 clinical training, specifically those based on student feedback and literature review that align AAMC EPAs with ACGME Sub-competencies. These included hand-off communication, opioids and pain management, antibiotic stewardship, high-value care and intravenous access. We invited local experts to deliver interactive talks on all five topics. Students were asked to assess their preparedness in each of the topic areas before and after the interactive discussions, as well as evaluate the Preparatory Course experience overall.

EVALUATION: Eighty percent (70/88) of the third-year medical students attended the course. 84% (59/70) of students completed the pre-course survey while 94% (66/70) completed the post-course survey. The two-sample Wilcoxon rank-sum (Mann-Whitney) test was used to compare students' responses to 10 items questions (2 per topic) before and after Prep Day. Students perceived preparedness improved significantly after the Prep Day experience in 9 of 10 topics ($P < 0.0000$). The only non-significant improvement was locating the University of Chicago antibiotic stewardship antibiogram and treatment pathways.

DISCUSSION / REFLECTION / LESSONS LEARNED: The clerkship years are not necessarily preparing students for advanced communication skills or safe, effective care around high-risk medications. A one-day boot camp experience improved perceived preparedness significantly in all but one category. We are currently assessing late-term (6 months) knowledge and preparedness and hope to incorporate a direct patient care observation experience for one or more of the covered topics following the 2019 Prep Day Course.

EQUAL MEDICINE: A NOVEL CAREER DEVELOPMENT PROGRAM FOR WOMEN PHYSICIANS IN AN INTERNAL MEDICINE RESIDENCY PROGRAM

Aditi Ramakrishnan²; Nicole Hadeed¹; Jennifer R. Lukela¹. ¹University of Michigan Medical School, Ann Arbor, MI; ²The Ohio State University, Columbus, OH. (Control ID #3185742)

NEEDS AND OBJECTIVES: 1. Identify the career development needs of women residents in Internal Medicine (IM). 2. Develop a curriculum to address gaps in traditional IM residency education, empower women residents, and foster gender equity.

SETTING AND PARTICIPANTS: We conducted a survey to understand the unique career development needs of women residents in our IM training program. We evaluated resident perception of the importance of various career advancement topics, preferred educational formats for content delivery, and perception of access to mentorship and female faculty role models. All women IM and Medicine-Pediatrics residents were invited to complete the needs assessment. Based on survey results, a pilot curriculum was developed. Post-workshop evaluations were distributed to all participating residents.

DESCRIPTION: The pilot curriculum consisted of three workshops open to all women residents in our training program. Sessions focused on the topics ranked most highly in the needs assessment: negotiation strategies (19%),

leadership skills (16%), and strategies for career advancement (15%). *Bold and Brave* featured a panel with women leaders in academic and private-practice medicine with small and large group discussions. *Art of Negotiation* focused on negotiation and career advancement strategies. The final workshop, *Perfecting your Pitch*, was an interactive session which featured strategies to combat imposter syndrome and become comfortable with self-promotion for career advancement. **EVALUATION:** Needs assessment survey response rate was 63%. These results were used to develop the pilot curriculum themes and format. Both quantitative and qualitative analysis was applied to post-workshop evaluations. Following *Bold and Brave*, 92% participants agreed/strongly agreed that they had a better understanding of how to develop leadership skills. Qualitative coding revealed that hearing "personal stories and experiences" of women physician leaders was most formative for resident attendees. All residents (100%) who attended the *Art of Negotiation* workshop agreed/strongly agreed that they had a better understanding of how to develop skills in negotiation following the session. Residents again highlighted personal stories and "hearing from real women" as most valuable. After *Perfecting your Pitch*, 89% of participants strongly agreed that the session was useful and covered relevant topics. 100% trainees agreed/strongly agreed that the session was conducive to increasing self-confidence.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our survey revealed gaps in the traditional IM residency curriculum, particularly for women trainees. This educational initiative sought to bridge those gaps and empower women residents with key skills and knowledge to advance their careers and foster equity in medicine. Based on post-workshop assessments, this curriculum achieved these goals and provided additional opportunities for women residents to identify women faculty mentors. This curriculum has created a novel, impactful educational space for women residents in our residency program.

EVALUATING RESIDENT OBSERVED STRUCTURED CLINICAL EXAMINATION (OSCE) PERFORMANCE WITH A MILESTONE-BASED SCORING TOOL

Molly A. Kantor¹; Brian Kwan^{2, 3}; Talya Bordin-Wosk^{2, 4}; Nivedita Ghosh^{2, 3}; Blaine Lovetro^{2, 3}; Meghan Sebasky^{2, 4}; Rebecca Sell^{2, 4}; Stacy T. Charat^{2, 3}.

¹University of California, San Francisco, San Francisco, CA; ²University of California, San Diego, Del Mar, CA; ³VA San Diego Healthcare, San Diego, CA; ⁴University of California, San Diego, San Diego, CA. (Control ID #3184477)

NEEDS AND OBJECTIVES: Internal medicine (IM) residency programs currently evaluate resident performance based on six Accreditation Council for Graduate Medical Education (ACGME) domains of clinical competency that encompass 22 milestones representing core competencies of becoming a physician. Recognizing that these domains can also be evaluated during Observed Structured Clinical Examination (OSCEs), we sought to create an OSCE scoring tool that reflected these milestones. Objectives: 1. Develop a novel evaluation tool for the OSCE based on competency milestones 2. Assess ease of use and consistency of a milestone-based OSCE evaluation tool

SETTING AND PARTICIPANTS: In 2016 and 2017, all PGY-1 IM residents (interns) completed an OSCE during the first month of residency. Interns rotated through four 15-minute scenarios: evaluation of a patient with chest pain, disclosure of medical error (two distinct scenarios), and delivery of feedback to a learner with knowledge deficits. Participants received immediate feedback from faculty and peer observers. The encounters were videotaped.

DESCRIPTION: We developed a structured scoring tool based on ACGME milestones and adapted to each clinical scenario, scored on a five-point Likert

scale. This tool was intended to mirror the global assessment of performance in the clinical setting. A scoring guide for each case was collectively developed. Faculty were trained in the use of the scoring instrument using practice exercises. Faculty then watched the videotaped encounters and completed the scoring tool, with one primary faculty member scoring each clinical scenario and a fifth faculty member scoring a random sample from each scenario to verify interrater reliability.

EVALUATION: Over two years, 98 IM interns participated in the OSCE, yielding 196 clinical scenarios (two per intern). Faculty evaluated 189 unique OSCE encounters (96.4%) and were successfully able to use the scoring tool. Qualitative evaluation of faculty experience with the tool revealed that it could be easily completed during OSCE observation. Interrater reliability is currently being evaluated.

DISCUSSION / REFLECTION / LESSONS LEARNED: A milestone-based OSCE scoring tool is feasible to develop, easy to use, and is an innovative method of evaluating an OSCE. Scoring guides helped faculty understand the application of a milestone-based scoring system for each OSCE scenario. Future analysis will include examining correlations between results from the OSCE scoring tool and other measures of resident performance.

EVALUATING RESIDENTS' IMPRESSION OF PRECEPTORSHIP BY USING NEAR- PEER TEACHING TECHNIQUE

Mehrshid Kiazzand, UPMC Mercy, Pittsburgh, PA. (Control ID #3185067)

NEEDS AND OBJECTIVES: The Accreditation Council for Graduate Medical Education Internal Medicine Residency Review Committee (RRC-IM) requires that training programs address resident teaching skills as a part of the practice-based learning competency. This need seems to be more challenging in the outpatient setting considering the limited visit time and rapid turnover. This lack of experience might be a major factor in determining whether a trainee pursues an academic career. We designed a Near- Peer Teaching curriculum to introduce trainees to principals of clinical teaching in outpatient setting and evaluate their opinion about taking a preceptor role as a future career.

SETTING AND PARTICIPANTS: Participants were third year (PGY3) Internal Medicine Residents at an academic outpatient clinic. We implemented a curriculum emphasizing the five microskills of the one minute preceptor teaching model during the 4-week Ambulatory Rotation. A total of 15 residents have participated in this curriculum from June 2018 to January 2019.

DESCRIPTION: Senior residents were scheduled for a 4-hour session during Ambulatory Rotation. They were able to have a one-on-one teaching session with a trained faculty to discuss teaching techniques in outpatient setting and review different scenarios. PGY3s were asked to use a 4-hour protected time session to precept first year trainees on a weekly basis. Both third and first year residents were observed by a faculty preceptor and received immediate feedback after the session.

EVALUATION: A survey questionnaire was sent to all PGY3s at the end of the rotation. It included 13 questions to evaluate residents' opinion and satisfaction about this experience on a 5-point scale. Residents cohort responses compared using chi-square test. Most residents had no previous experience with a preceptorship curriculum (73%). Prior to this exposure, 46.5% of residents felt precepting is easy or very easy and just 13% planned to pursue an academic career in outpatient setting. After participating in this curriculum, the majority stated they may or most definitely will plan to work as a preceptor (88.8%, P = 0.004) although just 2 out of 15 felt it was easy or very easy to work as a preceptor (P = 0.03). Most residents agreed the visit time would be longer if preceptors see patients with

all trainees (73.3%). About 73.3% of responders believed this session changed their opinion about preceptorship in an outpatient setting.

DISCUSSION / REFLECTION / LESSONS LEARNED: Understanding the clinical skills and the job responsibilities of outpatient preceptors is not clear for most residents. This curriculum allowed PGY3s the opportunity to practice teaching skills in outpatient setting in a supervised environment. Also, the curriculum was successful in enhancing the trainees' interest in pursuing a teaching career in outpatient setting. The trainees' interest, the teaching opportunities, and the time efficient curriculum indicates the Near-Peer teaching technique's potential in any residency program.

EVALUATING THE ROLE OF A FORMAL CXR CURRICULUM ON HOUSESTAFF EDUCATION

Angela O. Suen¹; Rachel Wojcik¹; Michael G. Simonson¹; Nicholas Vu³; Andrew Klobuka³; Richard H. Zou¹; Jared Chiarchiaro².

¹UPMC, Pittsburgh, PA; ²University of Pittsburgh, Pittsburgh, PA;

³University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #3186009)

NEEDS AND OBJECTIVES: Internal Medicine residents cite varying comfort levels with interpretation of chest radiographs (CXR) during clinical training. Being able to independently review CXRs is an important, but often overlooked, skill especially as formal interpretation may not be immediately available. The current gold standard for learning how to interpret CXRs is through clinical rotations, MKSAP, and Radiology Rounds. To the best of our knowledge, a standardized educational imaging curriculum tailored to Internal Medicine residents does not exist. In conjunction with the Department of Radiology, we created a prospective case-based chest radiograph curriculum aimed to increase clinical competency and comfort with image interpretation.

SETTING AND PARTICIPANTS: Internal Medicine interns (n=75) at the University of Pittsburgh Medical Center were randomized in 1:1 fashion into control (n=37) and intervention arms (n=38). A pre-curriculum quiz and survey were administered to all interns during their orientation. The final assessment will be conducted at an end-of-year retreat.

DESCRIPTION: The initial survey given during orientation focused on knowledge of and comfort in interpreting CXRs. Those randomized into the intervention arm were asked to anonymously participate voluntarily. Cases were sent out on a monthly basis with plans for a total of twelve months. Each of the 12 cases include a brief patient case, de-identified CXR, and a clinical-based multiple-choice question, with the focus on common clinical scenarios. Answers were accompanied by systematic image interpretation and case summaries. Those in the control arm participated in CXR interpretation as usual with clinical exposure and self-directed learning. At the conclusion of the study, all interns will participate in a post-curriculum quiz and survey to reassess knowledge, attitudes, and feedback. Educational exemption was obtained by the local Institutional Review Board (PRO17070620).

EVALUATION: Seventy-two (96%) interns completed the pre-curriculum quiz with a mean score of 75%. Through the first 4 cases of the prospective curriculum, there is a 37% response rate among interns in the intervention arm, with a mean score of 63%. The January 2019 case had a 13% (n=5) response rate with a mean score of 100%.

DISCUSSION / REFLECTION / LESSONS LEARNED: This is the first prospective randomized study of Internal Medicine residents evaluating the role of a standardized chest radiograph curriculum on education, knowledge, and clinical competency. While there is demonstrated interest in the curriculum, we have encountered limitations in content delivery. As established in other small studies, we saw that the voluntary aspect of this intervention resulted in relatively few responses that continued to decrease over time. It seems that there are limitations in deploying a voluntary intervention via email, including internal motivation, email fatigue, and prioritization. Because of the relatively few responses at present, it may be difficult to assess for efficacy by the end of the 12-month study.

EVALUATION OF A HUMANITIES CURRICULUM TO PROMOTE HIGHER LEVEL CLINICAL REASONING AT INTERNAL MEDICINE MORNING REPORT: RESULTS OF A QUALITATIVE ANALYSIS

Grace Prince; Rimma Osipov; Anthony Mazzella; Paul Chelminski. University of North Carolina, Chapel Hill, NC. (Control ID #3177717)

NEEDS AND OBJECTIVES: 1. Develop a humanities-based curriculum using art media (visual, music, and literature) to promote higher level clinical reasoning at Internal Medicine morning report. 2. Solicit interactive, structured observation and analysis of art media using *Visual Thinking Strategy (VTS)* [Katz, Khoshbin, 2014]. 3. Apply techniques of qualitative analysis to session recordings to demonstrate how participants apply and develop clinical reasoning skills through engagement with humanities media.

SETTING AND PARTICIPANTS: In medical education, the humanities are used to teach communication, promote wellness, and elucidate the social context of care. We piloted a curriculum to expand these roles, using the humanities to catalyze higher level clinical reasoning. Drawing on accepted theories of clinical reasoning, this project adapts the case-based morning report format to analysis of a "case" from the humanities. The pilot spanned four sessions and included medical students, residents and faculty.

DESCRIPTION: With a facilitator, the audience engaged collaboratively in observation and interpretation of a work of art, music, or literature using VTS.

EVALUATION: Each session was recorded and transcribed. Transcripts were analyzed using ATLAS.ti. Six codes, derived from the work of Judith Bowen, were assigned to responses: data acquisition, problem representation, contextualization, hypothesis generation, pattern recognition, and illness scripts. Coding was validated for reliability. Analysis to date reveals that clinicians apply analytic techniques used in the clinical setting to art. Within a single session, we saw progression from rudimentary data acquisition (15 occ) to higher level hypothesis generation (16 occ), contextualization (16 occ), and application of illness scripts (9 occ). Of 43 coded responses, we found 16 instances in which codes co-occurred within a statement, indicating that participants' clinical reasoning was not compartmentalized. Rather, clinicians iteratively blended and refined the processes of clinical reasoning, thus evincing *Dual Processing Theory*. This analysis suggests that clinical reasoning is more analogous to the epistemology of the humanities than often perceived and demonstrates a role for humanistic media in developing clinical reasoning.

DISCUSSION / REFLECTION / LESSONS LEARNED: The humanities offer a dynamic platform for cultivating observation and contextualization. Though humanities courses are well established for medical

students, this project integrates the humanities into a clinical learning environment for learners at all levels. Linking the respective frameworks of medical and humanities education is feasible and productive despite the time constraints within a busy residency program.

EVALUATION OF THE EFFECT OF INTRODUCTION OF A CLINICAL REASONING CURRICULUM IN A CLINICAL SKILLS COURSE FOR NOVICE MEDICAL STUDENTS.

Arati Kelekar¹; Nelia Afonso². ¹Oakland University William Beaumont School of Medicine, Huntington Woods, MI; ²Oakland University William Beaumont School of Medicine, Sterling Heights, MI. (Control ID #3167094)

NEEDS AND OBJECTIVES: Clinical reasoning (CR) is often not explicitly taught to novice medical students. A significant proportion of students graduate with suboptimal diagnostic reasoning abilities. Preclerkship clinical skills (CS) courses are an ideal venue to teach the CR process as they encourage students to integrate their basic science knowledge with patient centered communication skills. The goal of our study was to evaluate the impact of a clinical reasoning curriculum on the accuracy of relevant symptom query and generation of appropriate differential diagnoses by second year (M2) medical students assessed through an end of semester objective structured clinical examination (OSCE).

SETTING AND PARTICIPANTS: The study was approved by the institutional IRB. M2 students participating in the clinical skills course of winter 2018 formed the study group. These students received 3 new clinical reasoning sessions (total 6 hours). Whole case approach, serial cue approach, self explanation of pathophysiological mechanisms and comparison of closely related diagnoses were strategies used to teach clinical reasoning. Students from the previous year who had not received the curricular intervention formed the comparison group.

DESCRIPTION: The students interviewed a standardized patient (SP) presenting with a chief complaint of palpitations and dizziness and were asked to document a comprehensive history. They were also asked to list their top 3 differential diagnoses. In order to generate the items and value for scoring the case, 16 experienced faculty clinicians were asked to determine the importance of symptoms and historical elements in the presentation and required to generate a prioritized differential diagnosis. Students who consented (101 in CR group and 107 in non CR group) had their OSCE writeups graded. They were given 1 point for each significant symptom queried and 1 point for identifying each high priority differential diagnoses.

EVALUATION: Students in the CR group were more likely to query relevant symptoms than those in the non CR group but the results were not statistically significant (3.74 vs 3.34). For the high priority differential diagnoses, out of a maximum score of 3, students in the CR group achieved 1.98 while students in the non CR group scored 1.64, a result that was statistically significant ($p= 0.0002$).

DISCUSSION / REFLECTION / LESSONS LEARNED: Students who underwent the curriculum were more likely to identify symptoms of organ systems not anatomically related to the organ system of the chief complaint. For the differential diagnosis, hyperthyroidism and anxiety (pathophysiologically distant from the chest) were more often noted by the non curricular group. The top 5 differential diagnosis generated by students who underwent the CR curriculum mirrored those entertained by the clinicians. It is our impression that our curriculum which emphasized multi-organ system based differential diagnosis contributed to this occurrence.

EXPLORING PRIMARY CARE TRAINING CHARACTERISTICS OF UNITED STATES PRIMARY CARE INTERNAL MEDICINE TRAINING PROGRAMS

Samantha Alonso, Emory, Atlanta, GA. (Control ID #3185247)

NEEDS AND OBJECTIVES: There is a need for primary care physicians in the United States coupled with deficiencies in ambulatory training for resident physicians. To address this, specialized Primary Care Internal Medicine (PC IM) resident training programs or tracks provide focused training in primary care and ambulatory medicine. We surveyed leaders of specialized PC IM programs with the aim of collectively assessing how PC IM programs provide training and education in primary care.

SETTING AND PARTICIPANTS: We conducted a cross sectional survey of leaders of U.S. Primary Care Internal Medicine training programs or tracks identified via search of National Resident Matching Program (NRMP), the Fellowship and Residency Electronic Interactive Database (FREIDA), and program websites.

DESCRIPTION: Please see above in Setting and Participants

EVALUATION: Forty-five of the 70 programs identified as PC IM training programs or tracks completed the survey (64% response rate). On average, PC IM programs report PC residents engage in 22.8 weeks of training in the ambulatory setting per year and 69.4 continuity clinic sessions per year. Majority report PC residents engage in more weeks of ambulatory training and continuity clinic sessions than their categorical IM peers, specifically PC residents engage in an additional 10.1 weeks of ambulatory training per year and 20.8 additional continuity clinic sessions per year than their categorical IM peers. Majority, 77%, offered multiple continuity clinic sites which included university clinics, community non-profit clinics, public hospital based clinics, Veterans Administration-based clinics, private practice clinics, and Health Department or other government clinics. Number of patient visits per continuity clinic session varied by resident level of training (PGY1 3.5 visits; PGY2 4.9 visits; PGY3 5.7 visits). Standard ambulatory clinical rotations varied across programs with majority offering rotations in geriatrics, dermatology, orthopedics, and HIV medicine.

DISCUSSION / REFLECTION / LESSONS LEARNED: PC IM training programs aim to address the nation's shortage of primary care physicians by providing focused training in Primary Care. Our survey demonstrates that PC IM programs offer more ambulatory training time and continuity clinic exposure than traditional categorical IM training programs. Given their mission, more training in this setting is expected however raises the question of what level of ambulatory training should be considered standard for PC IM programs beyond what is required for ambulatory training per the Accreditation Counseling for Graduate Medical Education. PC IM programs should lean into their role as standard bearers in Primary Care training including setting expectations for PC IM training programs in terms of primary care training and education.

FAMILY FEUD MEETS SCRIPT CONCORDANCE: USING GAMIFICATION TO TEACH CLINICAL REASONING TO PRECLERKSHIP MEDICAL STUDENTS

Thilan P. Wijesekera, Yale School of Medicine, New Haven, CT. (Control ID #3185772)

NEEDS AND OBJECTIVES: Prioritizing a differential diagnosis- a key step in clinical reasoning- is a challenging skill to develop, ranking last in self-reported comfort in a survey of Yale School of Medicine (YSM) rising clerkship students. As part of the YSM Clinical Reasoning Course, this

educational innovation was created to: -Prepare 2nd-year medical students to prioritize a differential diagnosis for high-yield chief concerns during clerkships -Develop an engaging and versatile teaching modality grounded in clinical reasoning pedagogy

SETTING AND PARTICIPANTS: -Setting: As part of a larger student orientation prior to beginning clerkships, workshops took place for 70 minutes in a small conference room with a laptop connected to a large monitor to display educational content. -Participants: There were a total of 120 students and 10 faculty. Each pair of faculty (one attending and one 4th-year student) facilitated three back-to-back sessions with eight sets of 2nd-year students (two teams of four).

DESCRIPTION: -Preparation: Clerkship directors provided a list of the 10 most high-yield chief concerns for their respective rotations, which were given to students two weeks in advance. Case scenarios were created for six chief concerns (e.g., syncope, abdominal pain). These were provided to the faculty, whose answers were collected and weighted by frequency to create a consensus differential diagnosis, similar to a script concordance test. Points were assigned based on how often that diagnosis was selected. These values were uploaded into a PowerPoint formatted with the sound and visual effects of the game show "Family Feud". -During: For each round, both teams read each clinical scenario, took turns sharing their differential, explained their reasoning, and received points based on how high the diagnosis was on the faculty differential. Faculty ended each round with a 5-minute discussion demonstrating their own clinical reasoning on the case. The team wins who has the most points at the end of the six rounds.

EVALUATION: On a scale of 1-5 (i.e., poor, fair, good, very good, and excellent), students rated the workshop a 4.68, significantly higher than any of the eight clinical reasoning workshops over the past four years (range 3.27-4.25). One particularly representative student comment was: "Family Feud was INCREDIBLE! I wish we used this more during the preclinical curriculum... Creating comprehensive differentials is something I think we are all struggling with, and both the format and the clinical guidance from the student and attending present were so helpful and engaging. It was a really fun environment to make mistakes and learn."

DISCUSSION / REFLECTION / LESSONS LEARNED: Prioritizing a differential diagnosis is challenging, a sentiment shared before and after the session from our students. Our "Family Feud" game showed significant promise as an educational tool for teaching it by employing gamification to engage and motivate students while giving them the opportunity to learn through targeted pre-reading, discussion with colleagues, and faculty role modeling.

FEEDBACK ON A TRANSITION TO ATTENDING ELECTIVE: A NOVEL HEALTH SYSTEMS SCIENCE CURRICULUM EMPOWERING GRADUATING INTERNAL MEDICINE RESIDENTS FOR INDEPENDENT PRACTICE

Andrew Orr¹; Kendal Williams¹; Nadia L. Bennett²; Kamini Hogan¹; Deepa R. Nandiwada². ¹Perelman University School of Medicine, Philadelphia, PA; ²University of Pennsylvania, Philadelphia, PA. (Control ID #3167780)

NEEDS AND OBJECTIVES: The transition from residency to independent practice as a hospitalist is a challenging time in one's career. Residency prepares learners with much of the necessary clinical knowledge; however, exposure to autonomous decision-making, leadership training for interprofessional teams, and practical elements of attending daily work flow remain limited. Despite the increasing popularity of hospitalist medicine, only half of large academic Internal Medicine residency programs currently offer

hospitalist-based rotations to ease this transition (Ludwin et al. *Journal of Hospital Medicine*, 2018). Further, of the rotations offered, the majority focus on quality improvement/high value care or enhancing clinical skills. These rotations generally do not have a targeted curriculum focused on higher level health systems attending skills Curricular Objectives: *Discover challenges and opportunities of working as the attending physician on interdisciplinary teams Provide an opportunity for residents to oversee direct patient care and conduct independent rounds with an advanced practice provider (APP) Develop practice patterns and leadership skills for independent practice in conjunction with an APP*

SETTING AND PARTICIPANTS: This study involves Internal Medicine PGY-3s who have participated in the "Transition to Attending" Elective, APPs at Pennsylvania Presbyterian Medical Center, and current hospitalist faculty members within the University of Pennsylvania Health System.

DESCRIPTION: We developed a novel, two-week "Transition to Attending" elective in which third-year Internal Medicine residents assume the responsibility of an attending hospitalist, lead a team of APPs, and receive personalized training on high-yield elements of independent clinical practice (teaching on rounds, hospital systems, billing/documentation, Point of Care Ultrasound, leadership skills, and interprofessional best practices) from expert clinical educators. Residents work with an APP providing direct patient care while the attending of records sees patients separately and provides higher level feedback on systems based skills.

EVALUATION: From November 2017 to date, 7 residents completed the 2 week rotation and associated post-rotation survey. Two of the study authors analyzed this qualitative data to identify themes regarding the rotation's strengths, areas for improvement, and resident perception of preparedness for independent practice.

DISCUSSION / REFLECTION / LESSONS LEARNED: We found that this elective filled a gap in providing residents a true clinical experience working with APPs on higher level skills with deliberate feedback focusing on the transition to becoming an attending hospitalist. Residents identified that they did not realize how independent APPs are clinically and spent much of their time developing shared patient work flows. Our total number of participants is small but overall feedback shows that this has been a high yield rotation with an appropriate balance of patient care and acquisition of practical knowledge.

FEEDBACK ON GENERAL MEDICINE ROTATIONS: RECONCILING TWO PERSPECTIVES

Conor Walsh; Rupal Shastri; Manya Gupta. Rush University Medical Center, Chicago, IL. (Control ID #3175725)

NEEDS AND OBJECTIVES: The objective of our study was to unveil and understand differences in perceived frequency and quality of feedback between hospitalists and residents with the ultimate goal of improving the system and culture of effective feedback on general medical floors.

SETTING AND PARTICIPANTS: Our surveys were for residents who had completed at least 1 month of general medicine wards and hospitalists on teaching services.

DESCRIPTION: During October 2018, 114 internal medicine residents/preliminary medicine interns and 50 hospitalists were surveyed. The surveys included 14-16 similar questions for residents and hospitalists regarding feedback.

EVALUATION: Forty seven out of 114 residents responded to our survey while 26/50 hospitalists completed the survey. There was broad agreement of what constituted effective feedback with >55% of both groups agreeing

that it should be specific, timely, and include both positive and negative feedback. Of note, only 10.6% of residents thought that avoiding criticism was an important component of feedback. Regarding the frequency of feedback, 84.6% of hospitalists reported giving end of rotation feedback 75-100% of the time whereas 44.7% of residents reported receiving it that often. Regarding mid-rotation feedback, 57.7% of hospitalists reported giving it at least 50-100% of the time whereas only 32.6% of residents reported receiving it that often. A total of 37% of residents reported receiving mid-rotation feedback 0-25% of the time. Regarding feedback in general other than at the end of the rotation, 57.7% of hospitalists reported giving feedback either daily or every few days compared to 8.5% of residents reporting receiving feedback that often. On average, hospitalists rated themselves as 6.6/10 while residents rated the feedback as 6.1/10. Overall, 44.7% of residents reported being told "keep up the good work" or to "continue reading" without additional specific feedback. Regarding challenges to giving feedback, 76.8% of hospitalists reported time constraints, 42.3% reported difficulty with negative feedback, and 38.5% reported lack of enough direct observation of residents.

DISCUSSION / REFLECTION / LESSONS LEARNED: Both residents and hospitalists agree that feedback is important and that a more robust culture of feedback is desired. Our project shows that there are large discrepancies between the perceived frequency of giving/receiving feedback between hospitalists and residents. Of particular interest, residents want more specific and negative feedback even as hospitalists acknowledged their own discomfort with giving constructive criticism. Other challenges cited by hospitalists include time constraints and not enough direct observation of residents. Improving the culture of feedback at any institution will require a deliberate and collaborative effort between residents and attendings. By reconciling both perspectives, this project serves as a starting point for our institution towards achieving that goal.

FILLING THE GAP: A GERIATRICS AND PALLIATIVE CARE LEADERSHIP NEEDS ASSESSMENT

Gabi Schiller²; Ayla Pelleg¹; Helen M. Fernandez¹; Elizabeth Lindenberger¹. ¹Mount Sinai School of Medicine, New York, NY; ²Mount Sinai Hospital, New York, NY. (Control ID #3169844)

NEEDS AND OBJECTIVES: By 2030, those over the age of 85 will double to about 10 million. Despite this demographic imperative, there is a significant shortage in geriatricians and palliative care specialists. To best utilize this scarce, specialty resource, we propose the development of an elite workforce of future geriatrics and palliative care leaders who will lead health systems to best meet the needs of a vulnerable, aging population. Currently, there are no leadership curricula developed for Geriatric and Palliative Care fellows. Therefore, a needs assessment was conducted as an initial step to help establish a future leadership fellowship track within Geriatrics and Palliative Care fellowship programs.

SETTING AND PARTICIPANTS: Thirty-three key informants were interviewed, including national experts in the field of Geriatrics and/or Palliative care as well as former fellows who have graduated from Mount Sinai's Geriatric and Palliative Care Fellowship program. In total, 19 experts and 14 former fellows were interviewed. These interviews were conducted via video and/or phone conference over six months. Subsequent participants were recruited via the "snowball method," i.e. asking key informants to suggest other leaders in the field.

DESCRIPTION: Key informants (N= 33) participated in qualitative interviews that ranged from 15-60 minutes. Interview questions were formulated by both a created taskforce for this needs assessment and based on

previously distributed surveys to former Mount Sinai Geriatric and Palliative Care fellows. All interviews were audio-recorded and transcribed.

EVALUATION: A qualitative thematic analysis of all interviews was completed. Each interview was coded by two researchers to improve inter-rater reliability using the coding software NVivo. A coding dictionary, broken down by skills and knowledge categories, was created using both inductive and deductive reasoning.

DISCUSSION / REFLECTION / LESSONS LEARNED: Recruited participants saw the added value of a healthcare leadership track. Interviewees emphasized the need for fellows to have practical, diverse experiences during training to help prepare them for future leadership positions. Knowledge deficits emphasized were healthcare finance literacy and healthcare policy. Important skills a junior faculty should acquire included: negotiation, mentorship, and networking. Working in interdisciplinary teams and across professions was seen as a strength among Geriatricians and Palliative Care providers.

FLOURISHING IN THE CLERKSHIP YEAR: A LONGITUDINAL CURRICULUM INTRODUCING SKILLS TO REDUCE BURN-OUT AND FOSTER RESILIENCE IN MEDICAL STUDENTS

Rachel H. Kon¹; Tabor E. Flickinger¹; John Schorling¹; Natalie May¹; Justine E. Owens¹; Madaline Harrison²; Margaret L. Plews-Ogan¹. ¹University of Virginia, Charlottesville, VA; ²University of Virginia School of Medicine, Charlottesville, VA. (Control ID #3185156)

NEEDS AND OBJECTIVES: Burnout occurs in physicians at all levels of training and leads to poor patient satisfaction and physician wellbeing. At our institution, burnout rates in medical students are highest during the clerkship year. We developed a curriculum to foster resilience and wisdom with the objective of mitigating burnout.

SETTING AND PARTICIPANTS: We recruited students prior to starting the clerkship year for an optional program of 12 monthly sessions throughout the year. Students were randomized to an intervention group receiving instruction in resilience techniques or a control group. Of 139 eligible students, 29 chose to participate and were randomized. 27 students attended the first session and consented to be part of the study. 3 later dropped out.

DESCRIPTION: Students in the program met monthly for two hours in control or intervention small groups with the same two faculty members. All sessions included debriefing on clerkship events and the intervention group also had instruction in specific techniques in four areas: reflective practice, mindfulness, appreciative practices, and narrative medicine. Each area was addressed three times during the year to reinforce skill acquisition.

EVALUATION: In pre- and post-clerkship qualitative surveys, themes were identified related to students' desires for shared experiences, peer support, mentorship, and reflection. Intervention students rated techniques in narrative medicine, mindfulness, appreciative practice, and reflective practice as high or very high value. More students in the intervention than the control group rated these aspects of the curriculum as high or very high value: having a place to process my clerkship experience (92% vs 70%), helping me manage stress and difficult emotions (77% vs 60%). 92% of intervention students would recommend the sessions to others. Students completed pre and post questionnaires including the 22-item Maslach Burnout Inventory (MBI), the 10-item Connor Davidson Resilience Scale (CD-RISC), and the 39-item 3-D Wisdom Scale. There were significant differences at follow-up in overall wisdom (3.90 vs 3.60, p=0.026), but not in MBI or CD-RISC scores between the two groups.

DISCUSSION / REFLECTION / LESSONS LEARNED: Students in the intervention recognized high value in the techniques taught in this

curriculum and both groups valued having this setting to process their clerkship experiences. Students were able to give examples of how they used these skills in their clinical work. The positive feedback from participants is shaping an expansion of this program to all our students. A larger study is still needed to see if this training can reduce burnout and improve resilience.

FOCUSED POCUS: HOW CAN WE TEACH ULTRASOUND IN INTERNAL MEDICINE RESIDENCY?

Laura Horton; Stephanie R. Eizember; Rafael Paez; Sanjay M. Salgado; Lindsey Wu. Brigham and Women's Hospital, Boston, MA. (Control ID #3184993)

NEEDS AND OBJECTIVES: Diagnostic point-of-care ultrasound (POCUS) is an ACGME requirement in emergency medicine and critical care training programs, and the American College of Physicians has formally acknowledged the important role of POCUS in internal medicine (IM). However, because few IM faculty use POCUS in their own practice, the optimal method to teach POCUS to IM residents is unclear. The immersive workshops often used for faculty training are not a feasible option for training large groups of residents. Our aim was to design and evaluate an easily-learned and high-yield POCUS curriculum that could be delivered to residents longitudinally during a clinical rotation.

SETTING AND PARTICIPANTS: Given the demands of residency, we designed a POCUS curriculum that could be taught in four one-hour sessions, delivered weekly during residents' month-long inpatient rotations. Each session was led by faculty trained in the curriculum and consisted of three to five resident learners.

DESCRIPTION: We intentionally limited the curricular content based on the teaching time allocated. We therefore focused solely on select exams in volume assessment, chosen out of over 15 exams taught in most IM POCUS courses because they are well-studied, technically straightforward, and valuable on general inpatient medicine. The four sessions included: 1) knobology/jugular venous pressure, 2) inferior vena cava, 3) pulmonary (B-lines, pleural effusions), and 4) review. The first three sessions consisted of didactics followed by directed POCUS on pre-identified and consented hospitalized patients, and the final session was spent on skill development entirely at the bedside. We piloted the POCUS curriculum on a single general medicine team over three month-long rotations. At the end of each month, all residents on general medicine (including those on the intervention team and those on control/non-intervention teams) were surveyed.

EVALUATION: Compared to the control group, residents who rotated on intervention teams reported greater POCUS comfort (1.9 versus 0.6 on a scale of 0=not comfortable to 4=extremely comfortable), frequency of use (2.7 versus 0.5 on a scale of 0=never to 4=daily), and knowledge (66% versus 42% of questions correct on an assessment of factual knowledge, i.e. ability to identify key pathology on still ultrasound images).

DISCUSSION / REFLECTION / LESSONS LEARNED: POCUS is increasingly recognized as an effective tool in IM, but the time required to reach proficiency in its vast applications is a barrier to training residents. By choosing focused content, we successfully delivered a longitudinal curriculum within the timeframe of a clinical resident rotation. Using real-time patient applications of POCUS allowed both for learner skill development and garnered buy-in on the value of POCUS in the clinical setting, maximizing key principles of adult learning theory. By increasing portable ultrasound equipment and training a small group of core faculty, we hope to expand this pilot so that it becomes integrated into all inpatient general medicine rotations.

FREQUENCY OF ETHICAL ISSUES ON A GENERAL INTERNAL MEDICINE TEACHING SERVICE AT AN URBAN, TERTIARY CARE CENTER

Matthew W. McCarthy, Weill Cornell Medicine, Irvington, NY. (Control ID #3182900)

NEEDS AND OBJECTIVES: Little is known about the daily ethical conflicts encountered by hospitalists on the General Internal Medicine (GIM) service that do not prompt a formal clinical ethics consultation. These issues may cause significant moral distress and are an under-recognized educational opportunity. We sought to characterize the epidemiology of ethical issues arising on a GIM teaching service during an academic year and compare them to those seen by the ethics consultation service.

SETTING AND PARTICIPANTS: We describe the frequencies of ethical issues identified during daily rounds on GIM teaching services at a metropolitan, tertiary-care, teaching hospital. Data was collected from September 2017 through May 2018 by two attending hospitalists from the ethics committee who were embedded on GIM rounds and was compared to all ethics consults at the institution during 2017.

DESCRIPTION: 270 patients were evaluated and 113 ethical issues were identified in 77 of those patients (28. 5%) on the GIM service. These issues most frequently involved discussions about goals of care, treatment refusals, decision-making capacity, discharge planning, cardiopulmonary resuscitation status, and pain management. Only 5 formal consults were brought to the Hospital Ethics Committee for these 270 patients ($p<0.001$). When compared to the cases seen by the ethics service, hospitalists and trainees on the GIM service dealt significantly more frequently with problems around clarifying goals of care ($p<0.01$), whereas clinical ethicists dealt more frequently with problems involving surrogate decision-making ($p<0.05$).

EVALUATION: The results of this study have been used to create an undergraduate seminar in medical ethics at the Macaulay Honors College at the City University of New York (CUNY). The course is now in its second year and has expanded to cover ethical issues encountered in GIM, psychiatry, social work, nursing, and other subspecialties.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our data is the first prospective description of ethical issues arising on academic GIM teaching services. These scenarios present an unrealized opportunity and is an important step in the development of a targeted ethics curriculum for hospitalists. This has already begun with the creation of an undergraduate curriculum and will soon expand to graduate medical education.

GAMING FOR THE WIN IN RESIDENT EDUCATION: GAMING TO ENHANCE RESIDENT LEARNING

Allie Dakroub^{1, 2}; Diane L. Levine³. ¹University of Pittsburgh Medical Center, Pittsburgh, PA; ²Wayne State University/Detroit Medical Center, Detroit, MI; ³Wayne State University, Detroit, MI. (Control ID #3186285)

NEEDS AND OBJECTIVES: In response to declining attendance and engagement, we sought to revitalize our resident board review. We designed more active educational sessions through the implementation of gaming. We hypothesized that a game-based board-review curriculum would improve attendance and enhance residents' learning experience.

SETTING AND PARTICIPANTS: Our residency program is at an academic, urban health care system with approximately 105 IM residents.

Board review is held weekly and learning games were implemented for 1 hour, weekly.

DESCRIPTION: We developed several learning games that provided a team-based competitive experience for resident board review. These games were implemented during weekly board review sessions for 20 weeks throughout the 2017-2018 academic year. The residency is divided into 5 cohorts, each comprising about 21 residents distributed evenly by PGY level. Each cohort competed in these learning games, and the competition concluded with a 4-hour "Cohort Cup Olympics" grand finale. The cohort with the highest overall score was treated to dinner and their team name was engraved on a trophy, the "Cohort Cup". Pre- and post-curriculum electronic surveys comprising 5-point Likert-type items were used to assess resident perceptions of the academic half-day experience and satisfaction with the "Cohort Cup". Attendance was also tracked.

EVALUATION: A pre- and post-intervention survey comprising 5-point Likert-type items was used to gauge resident perceptions and satisfaction of the novel game-based board review. 84 residents completed the pre-survey, and 74 completed the post-survey. Additionally, resident attendance was tracked and improved from an average of 12 residents per session for the didactic board-review to 25 residents per session for the game-based board review. [survey item, pre-intervention average, post-intervention average] (Survey Likert Scale: 1 - strongly disagree, 2-strongly agree, 3-neither agree nor disagree, 4-agree, 5-strongly agree). I am engaged in the academic half-day as they are currently designed, 2.74, 3.8 The current structure of the academic half-day contributes to my education, 2.68, 3.95 I prefer games and active learning as opposed to standard lecture based didactics for my learning, 3.77, 4.32 I prefer the "Cohort Cup" activity as opposed to standard lecture based didactics for my learning, n/a, 4.24 I feel that I learn more from the "Cohort Cup" activity than I do from standard lecture based didactics. n/a, 4.03 I prefer to have the "Cohort Cup" remain a part of my didactics. n/a, 4.42 I feel that the "Cohort Cup" activity has helped me bond with others in my residency. n/a, 4.36

DISCUSSION / REFLECTION / LESSONS LEARNED: Implementation of an educational strategy that incorporates the fun of games and the motivation of competition resulted in increased resident attendance and engagement in our residency program's board review. The "Cohort Cup" model could be adapted for other curricular content or for board review curricula in other programs looking for innovative ways to incorporate active learning.

GRIT AMONG FIRST-YEAR INTERNAL MEDICINE RESIDENTS

Andrew J. Klein¹; Scott D. Rothenberger²; Kathryn Berlacher³; Thomas Grau¹. ¹University of Pittsburgh School of Medicine, Pittsburgh, PA; ²University of Pittsburgh, Pittsburgh, PA; ³University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #3186326)

NEEDS AND OBJECTIVES: Grit is a characteristic, defined as passion and perseverance for long-term goals, that is associated with success and avoidance of burnout in a number of fields, but whether this is a relevant construct among physicians has not been well established. We aimed to evaluate Grit among our first-year internal medicine residents in relation to burnout. Our hypothesis is that July Grit level may help predict those who may be at highest risk of developing burnout.

SETTING AND PARTICIPANTS: We recruited 75 postgraduate year 1 (PGY1) residents in Internal Medicine at a major academic hospital program.

DESCRIPTION: We administered the well-validated short Grit survey and Maslach Burnout Inventory in July and December of 2018 to all PGY1

residents in Internal Medicine. An additional background survey was administered in December to collect information on potential confounders, including age, gender identification, race, ethnicity, marital status, social supports, career goals, current rotation, work hours, daily exercise, and level of financial debt. Survey responses from the December administrations are still being collected. Levels of Grit and burnout in July and December were compared using paired Students t-tests with a 2-sided p-value<0.05 considered statistically significant. Additional analysis to control for confounders and elucidate any association between Grit and burnout using linear regression is planned.

EVALUATION: Among 75 PGY1 residents recruited, 49 have completed both the initial and 6-month surveys at this time. Two measures of burnout significantly increased, including both emotional exhaustion ($p < 0.001$) and cynicism ($p < 0.001$), while personal efficacy scores were unchanged ($p = 0.56$). Grit scores did not change ($p = 0.32$). Additional analysis to determine the relationship between Grit and burnout in this population is pending.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our current analysis is unsurprising. PGY1 residents are at high risk of developing burnout, particularly in the first 6 months of residency. Similarly, the short Grit scale was developed to determine one's trait-level Grit and its ability to evaluate changes in Grit over time has not been assessed. Additional analysis is needed to determine if Grit is a helpful construct in this population.

HEALING PRESENCE: AN ELECTIVE ICU CURRICULUM FOR MEDICAL STUDENTS BASED IN THE CLINICAL PASTORAL EDUCATION TRAINING MODEL

Jeremy Baruch²; Kristin M. Collier¹. ¹University of Michigan, Bloomfield Hills, MI; ²University of Michigan, Ann Arbor, MI. (Control ID #3171991)

NEEDS AND OBJECTIVES: Medicine is best practiced interprofessionally. We have much to learn from our partners in spiritual care with regards to reflection, formation and meaning in medicine. The "ICU-Chaplaincy Healing Presence" is an elective experience for medical students on their adult ICU rotations which complements their ICU education through exposure to the art and skills of hospital chaplaincy. The learning objectives of this program include: 1. Providing students with a framework with which to process emotions that arise in caring for acutely ill and dying patients. 2. Reflecting on the interpersonal dynamics of patient care. 3. Developing patient care skills based in Clinical Pastoral Education. 4. Exploring how students' spirituality shapes their approach to patient care and how they cope with the challenges of training.

SETTING AND PARTICIPANTS: The elective is open to senior medical students during adult ICU rotations at Michigan Medicine. The chaplains are members of Michigan Medicine's Department of Spiritual Care.

DESCRIPTION: To achieve these objectives, this elective provides students with the opportunity to round on ICU patients with chaplains, develop chaplaincy skills and engage in four structured, small group experiences facilitated by a chaplain. The first session involves discussion and reflection on such questions as "What is spirituality?" "How does your spirituality inform your patient care?" "What thoughts/feeling often arise in patients and their families during times of illness?" Sessions 2 and 3 involve "verbals" where students transcribe a conversation they had with a patient during one of their chaplain supervised encounters. The transcript is then read to the group, and with feedback, the student reflects on the questions asked, themes that arose, and missed opportunities. Session 4 is a wrap up session where students are asked to reflect upon how their perspectives may have changed as a result of the elective and what insights were gained.

EVALUATION: Students are asked to fill out pre- and post- elective questions (N=17) Post Participation Survey Results: Pre-participation, 53%

of students thought it was important or very important to consider how their values can be actualized in the hospital; which increased to 94% post participation. 88% thought that finding personal meaning in taking care of patients was important or very important prior to participation, compared with 100% post participation. Pre-participation, 54% thought that responding to patients' spiritual concerns was important or very important, compared with 94% post-participation.

DISCUSSION / REFLECTION / LESSONS LEARNED: From narrative feedback provided by the students, we learned that students who participated in the elective reclaimed a sense of meaning and purpose in their training. In addition, students perceived therapeutic value as they were able to process the ICU experience in a supportive group led by a chaplain.

HEALTH IN THE NEIGHBORHOOD CONTEXT: A SOCIAL DETERMINANTS OF HEALTH (SDH) FOCUSED HOME VISIT CURRICULUM FOR INTERNAL MEDICINE RESIDENTS

Iman Hassan¹; Etsemaye P. Agonafer²; Kwonho Jeong³; Scott D. Rothenberger³; Thuy Bui³; Carla L. Spagnolletti¹; Maggie K. Benson¹.

¹University of Pittsburgh Medical Center, Pittsburgh, PA; ²UCLA, Los Angeles, CA; ³University of Pittsburgh, Pittsburgh, PA. (Control ID #3186242)

NEEDS AND OBJECTIVES: To enhance residents' awareness of SDH by providing a framework for understanding the connection between patients' health with their social and neighborhood context. Curriculum goals are to use home visits to increase: 1) recognition of the link between neighborhood-level SDH and health; 2) familiarity with local neighborhoods and tools for identifying community resources; and 3) rates of asking about and addressing SDH with clinic patients.

SETTING AND PARTICIPANTS: All 46 2nd year internal medicine (IM) residents participated in the curriculum during a 4-week ambulatory rotation. A total of 48 IM residents who did not receive the curriculum were used as historical controls.

DESCRIPTION: The curriculum began with a 60-min didactic, small-group introduction on how neighborhoods impact health and a demonstration of electronic tools to identify community characteristics and resources. Residents selected one of their clinic patients. They then conducted a guided virtual assessment of their selected patient's neighborhood, followed by a ½ day SDH-focused home visit and exploration of the patient's neighborhood. Residents participated in a 60-min debriefing session.

EVALUATION: Pre and post intervention surveys assessed attitudes and self-reported behavior on a 5-point Likert scale. After the curriculum, residents were more likely to agree that, "It is important for me to be knowledgeable about the neighborhoods in which my patients live" (4.2 pre vs. 4.4 post, $p < 0.01$) and were more comfortable asking patients about their SDH (3.7 pre vs. 4.1 post, $p < 0.01$). They reported asking more frequently about SDH (3.2 pre vs. 3.5 post, $p < 0.01$) and addressing SDH (3.1 pre vs. 3.4 post, $p < 0.01$). Specifically, residents asked more about neighborhoods in which patients live, access to healthy food, housing, transportation barriers, and health insurance (all $p < 0.02$). They more frequently addressed access to healthy food, housing, and transportation barriers (all $p < 0.05$). Residents also considered a patient's neighborhood more frequently when developing a plan of care (2.7 pre vs. 3.0 post, $p = 0.02$) and used online tools to find resources for patients (7% pre vs. 64% post, $p < 0.01$). Compared to controls, those who underwent the curriculum more frequently asked about the neighborhood where their patients live ($p = 0.03$), asked about and addressed access to healthy food (both $p < 0.01$), and used online tools to identify resources ($p < 0.01$).

DISCUSSION / REFLECTION / LESSONS LEARNED: This home visit curriculum increased overall attitudes and self-reported behaviors regarding SDH. Chart review to assess rates of health record tool use to address SDH and 6-month survey data to assess curricular durability currently underway.

HEALTH SYSTEMS SCIENCE IN THE CLERKSHIP: APPLICATION TO PATIENT CARE

Ana M. Yepes-Rios¹; Mark Mayer¹; Neil Mehta¹; Aaron Hamilton²; Colleen Colbert²; Beth Bierer². ¹Cleveland Clinic Lerner College of Medicine, Cleveland, OH; ²Cleveland Clinic, Cleveland, OH. (Control ID #3178315)

NEEDS AND OBJECTIVES: Education in Health Systems Science (HSS) has emerged as the third pillar of medical education to complement basic and clinical sciences and address the demands of evolving healthcare environments. In the Cleveland Clinic Longitudinal Clerkship (CCLC), an innovative HSS curriculum challenges medical students to reflect on the care of patients in the context of the healthcare system and the populations they serve. The objectives are to 1. Demonstrate an awareness of their roles in an interprofessional, collaborative healthcare team to improve healthcare outcomes; 2. Demonstrate the application of core didactic objectives to the care of patients via a blog reflection.

SETTING AND PARTICIPANTS: Participants are a cohort of 75 third-year medical students in the CCLC. Students come from Case Western Reserve University's School of Medicine, including university and college (Cleveland Clinic Lerner College of Medicine) programs. Internal Medicine residents review the blogs

DESCRIPTION: Building upon a foundation implemented in the pre-clerkship, the HSS curriculum spans the academic year with eight, 1-2-hour, interactive learning sessions on the topics of Patient Safety, Quality Improvement, Transitions of Care, Social Determinants of Health, Inter-professional Education, Population Health and High Value Care. After each session, objectives and guiding questions prompt students to blog a reflection on the application of the session to patient care in the clerkship. Blogs are posted in a Google + private community that is further subdivided into 8 small groups to facilitate interactive discussions. Each group is actively monitored by 2 Internal Medicine residents who offer near-peer teaching and feedback, and by the course director.

EVALUATION: Students are assessed on their ability to transfer learning from the classroom session to their clinical experiences (experiential learning). To date students consistently reflect on their role in the healthcare team, and residents have offered feedback and support with near-peer experiences. Each session is systematically evaluated by students. To date, students report the sessions meet course objectives and engages them at an appropriate level of training.

DISCUSSION / REFLECTION / LESSONS LEARNED: The HSS thread in the clerkship and associated blogs meets the objectives of incorporating HSS education into the curriculum, with an associated authentic learning experience. Resident reviews of student blogs have created a safe, invaluable near-peer learning experience for both residents and students, offering a continuum of education in HSS.

HERPES, HYPERTENSION, AND HEALTH SYSTEMS: DEVELOPING AND DELIVERING A HEALTH EDUCATION PROGRAM AT A COUNTY JAIL

Daniel Cole¹; Cameron Bright²; Wendy Miller¹; Saida Yassin¹; Jessica Sjoholm¹; Rachel S. Silva¹. ¹Hennepin Healthcare, Minneapolis, MN; ²University of Minnesota, Minneapolis, MN. (Control ID #3182862)

NEEDS AND OBJECTIVES: Provide health education to justice-involved individuals Increase resident exposure to health disparities in justice-involved populations. Foster teaching and curriculum development skills for residents

SETTING AND PARTICIPANTS: Four internal medicine residents and one Masters of Public Health student developed a curriculum and led health education classes at the Hennepin County Adult Detention Center (ADC) in Minneapolis, Minnesota. Bimonthly meetings were held in a classrooms in the ADC, typically facilitated by 1 to 2 participants and attended by 10 to 18 male attendees per session.

DESCRIPTION: Participants contributed to the development of a health education curriculum which included topics such as diabetes and sexually transmitted diseases. Hour-long programming was lecture-based with an emphasis on class participation and group discussions related to the chosen topics. Participants and class attendees completed post-participation surveys which were used to evaluate the pilot program.

EVALUATION: Participants were surveyed regarding their experiences teaching in the program. They strongly agreed that teaching improved their community education skills and impacted their perspective on incarceration with average ratings of 91 and 89 out of 100, respectively. Major themes learned included communication skills for a classroom, knowledge base and misconceptions about health topics among individuals currently incarcerated, and appreciation for the daily life of incarcerated individuals. Class attendees were also given a survey regarding the classes with 238 surveys collected over the first 6 months of the program. Attendees overwhelmingly marked that they found the class helpful. On a 5-point Likert Scale measuring how much attendees felt they knew before and after the class regarding the topic, there was a mean increase of 1.12 points ($p < .01$).

DISCUSSION / REFLECTION / LESSONS LEARNED: Research has shown that justice-involved individuals have higher rates of chronic health conditions, substance use disorders, and mental illness than the general population. Yet very few residency programs offer opportunities for trainees to gain intentional exposure to justice-involved populations. The ADC health education program provided an opportunity for a team of trainees to gain experience working with the local jail population while simultaneously providing a valuable service to the justice-involved individuals. Feedback from trainees indicates that the experience not only improved their understanding of the health needs and behaviors of the justice-involved individuals, but that they improved their ability to provide general health education. In addition, justice-involved participant feedback suggests that the material presented was not only informative but impactful with many indicating they would make a behavioral change as a result of what they learned. Based on the overall positive feedback from both groups, plans are underway to expand the ADC health education program to cover additional topics and to include medical students as learner/educators.

HIGH VALUE CARE AT YOUR FINGERTIPS: DEVELOPMENT OF AN IPHONE APP

Jessica Donato¹; Courtney A. Covert². ¹Cleveland Clinic, Beachwood, OH; ²Cleveland Clinic, Cleveland, OH. (Control ID #3184023)

NEEDS AND OBJECTIVES: A monthly high value care (HVC) conference was implemented at our large internal medicine training program. Each conference includes a review of evidence and guidelines related to the clinical topic for the given conference and a 1-page handout with key take-home points related to high value management strategies and key evidence. Trainees within our program sought an electronic resource for easy access to curricular materials from each HVC conference. We sought to develop a high value care iPhone application to make high value care curricular materials and other

electronic high value care resources readily available to our training program.
SETTING AND PARTICIPANTS: A monthly, high value care conference targeting all post-graduate years (1-3) was implemented at our large internal medicine training program starting in the fall of 2017 with 43-81 trainees in attendance at each conference.

DESCRIPTION: An iPhone application was developed in December 2018. The application includes access to PowerPoint slides and 1-page handouts from each high value care conference. The application also includes links to six key HVC websites including Choosing Wisely, Costs of Care, and the American College of Radiology Appropriateness Criteria. The application also includes a "Question of the Week" in which users can complete a MKSAP question under the domain of high value care.

EVALUATION: The application will be released to our training program in the coming months through the Apple App Store. We plan to measure the number of downloads and assess the utility and impact of the application in our annual survey evaluating the high value care conference.

DISCUSSION / REFLECTION / LESSONS LEARNED: Medical education in the current state must adapt to millennial learners. Our high value care conference includes high-yield PowerPoint slides which summarize evidence and guidelines, in addition to a 1-page handout. In order to make these curricular resources readily available to our trainees, we developed an iPhone application. This electronic tool is convenient, user-friendly and includes other HVC resources and educational tools such as a question of the week. We believe this will enhance trainee implementation of high-value care practices through more readily available resources and evidence to support high-value management strategies taught in our HVC conference.

HIGH VALUE CARE MORNING REPORT: A TEAM-BASED, INTERDISCIPLINARY CONFERENCE TO TEACH COST-EFFECTIVE CARE

June Kampangkaew^{2, 4}; Nathan C. Nowalk^{2, 4}; Diana Stewart³; Prathit Kulkarni^{2, 4}; Michelle Sibille^{1, 2}. ¹MD Anderson Cancer Center, Houston, TX; ²Baylor College of Medicine, Houston, TX; ³Baylor College of Medicine/Michael E. DeBakey VA Medical Center, Houston, TX; ⁴Michael E. DeBakey VA Medical Center, Houston, TX. (Control ID #3185335)

NEEDS AND OBJECTIVES: Health care spending continues to rise with billions of dollars wasted annually, which has inspired a high value care (HVC) movement to curb expenses while improving patient outcomes. We aimed to implement a team-based, interdisciplinary morning report (MR) conference emphasizing high value, evidence-based work-up in order to educate physicians on the tools and resources of HVC practice. 1. Improve knowledge in HVC principles. 2. Improve confidence in utilizing HVC resources. 3. Provide a forum for interdisciplinary collaboration.

SETTING AND PARTICIPANTS: We utilized the existing MR case-based conference series to address the need for HVC training in our curriculum. Participants included Baylor College of Medicine residents and medical students rotating on inpatient internal medicine rotations.

DESCRIPTION: The conference follows the typical MR format, which includes presentation of the history and physical of an actual case. During preparation, the resident is encouraged to work with a content-expert faculty mentor as well as a HVC mentor who provides guidance on HVC resources. Each hour-long conference begins with the resident presenting the case. The audience is then divided into teams of different learner levels to discuss the differential diagnosis, what diagnostics they would order for evaluation, and an estimation of the prices for each test ordered. After the teams discuss their proposed evaluation and management, the presenter discusses the actual evaluation and management, as

well as the ideal evidence-based HVC evaluation for the case and the estimated prices of these services.

EVALUATION: From January 2018 to December 2018, 24 conferences were held with approximately 300 total attendees. Seventy attendees were surveyed before and after implementation of the HVC morning report curriculum. Surveys addressed knowledge, skills, and attitudes for HVC using a 5-point Likert scale (1 = strongly disagree or very unlikely, 5 = strongly agree or very likely). Interns showed lowest likelihood to "consider cost when discussing management" prior to the HVC morning report, while attendings showed highest likelihood to consider cost. The most agreed upon statement, before and after the MR, was the statement: "Physicians have a responsibility to patients to consider cost when providing treatment." Following conference attendance, all items surveyed showed an increase towards "strongly agree."

DISCUSSION / REFLECTION / LESSONS LEARNED: We have now adapted this conference to three different hospital settings in our residency program which demonstrates generalizability for replication. Our conference was expanded to MD Anderson Cancer Center, where the presenter emphasized a HVC approach to palliative care. In this way, the series is adept at underscoring the specific qualities of practice settings to create a unique and enriching conference.

HIGH-VALUE CARE EDUCATION FOR THIRD-YEAR MEDICAL STUDENTS

Rachna Rawal¹; Paul Kunzath²; Jennifer Schmidt³. ¹Saint Louis University, St. Louis, MO; ²Saint Louis University School of Medicine, University City, MO; ³Saint Louis University, Saint Louis, MO. (Control ID #3183527)

NEEDS AND OBJECTIVES: Recognize medical student need for high-value care education Identify improvements in medical student self-awareness of high-value care Identify barriers for medical students practicing high-value care

SETTING AND PARTICIPANTS: Literature shows that habits established during training follow physicians through their career. Therefore, providing education to medical students will enable them to recognize and apply high-value care, establishing it as a practice pattern early in their careers. Current state assessment surveys revealed 80% of our institutions' incoming third year medical students were not familiar with the term "high-value care". Additionally, 100% of students identified no prior high-value care education. Our data confirmed what is known in literature—medical students get little exposure to high value care concepts. This presented an opportunity to develop a high-value care curriculum for students.

DESCRIPTION: Participants are third year medical students rotating on inpatient Internal Medicine core clerkship. Data is collected via pre and post-intervention survey. Objectives include defining high-value care, distinguishing between low and high-value care, and applying evidence-based guidelines to patient care. Interventions include two sessions: an introduction to high-value care during clerkship orientation and a case-based, interactive session mid-way through the clerkship. The material is designed to show students how to consider the risks, benefits and costs of diagnostic testing to make informed diagnostic decisions.

EVALUATION: When students defined high-value care in the pre-survey as a free response, 75% of the free responses included "costs", "waste", or "quality" suggesting familiarity with high-value care concepts but lack of more nuanced meanings. Students who felt comfortable utilizing evidence-based medicine for decision making increased from 59% to 91% (statistically significant, p<0.05). Post-intervention, 89% of students felt comfortable discussing testing indications with their team, statistically significant increase

from 48% pre-intervention. 83% of students felt comfortable choosing between a CBC with differential versus without compared to 10% pre-intervention ($p<0.05$). Additionally, 93% of students felt comfortable choosing between a BMP and CMP compared to 19% pre-intervention ($p<0.05$). The students identified a *lack of knowledge* and *not having a voice* as barriers to engaging in high-value care discussions.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our data reveals that while students may be familiar with high-value care, they require additional training on its application. After two didactic sessions, students had improved attitudes and application of evidence based guidelines and increased engagement in high-value care discussions with their teams. However, additional initiatives are needed to reduce self-identified hierarchy barriers.

IMAGING WISELY: AN INTRODUCTION TO THE ACR APPROPRIATENESS CRITERIA AND ANALYSIS OF ITS IMPACT ON INTERNAL MEDICINE RESIDENTS

Mike K. Cheng¹; Andrea L. Magee²; Carina W. Yang¹; Joyce W. Tang¹.

¹University of Chicago, Chicago, IL; ²The University of Chicago, Chicago, IL. (Control ID #3178183)

NEEDS AND OBJECTIVES: Inappropriate radiological exam ordering contributes significantly to healthcare waste. The American College of Radiology's (ACR) Appropriateness Criteria (AC) were designed to inform radiological exam ordering practices, but many internists are unfamiliar with them. To promote high-value ordering practices and use of this evidence-based resource, our team of internists and radiologists developed a curriculum introducing medicine residents to the ACR AC.

SETTING AND PARTICIPANTS: We offered our Imaging Wisely curriculum to University of Chicago internal medicine interns from 2017-2018. To date, 23 completed the curriculum.

DESCRIPTION: Our curriculum included: (1) discussion of medical risks of radiological exam overuse and sample exam charges; (2) introduction to the ACR AC website and app; (3) application of the AC to case vignettes through Radiology-TEACHES™ software; (4) group discussions about the vignettes; and (5) a radiologist-led session about principles of high-value exam ordering.

EVALUATION: We used pre- and post-intervention surveys to assess for change in knowledge (through open-book testing with Radiology-TEACHES™ vignettes) and attitudes related to high-value exam ordering. Follow-up surveys 3-11 months post-intervention assessed for durability of change. We used McNemar's tests and paired t-tests for analysis.

DISCUSSION / REFLECTION / LESSONS LEARNED: N=23 completed the initial surveys; n=18 completed the follow-up survey. Pre-intervention, 35% of residents were unaware of the ACR AC; only 25% reported it among their top 3 resources guiding ordering decisions. Post-intervention, knowledge scores for appropriate exam ordering increased from 59% correct answers (SD 0.16) to 89% (SD 0.14); $p=0.0001$. The ACR AC were more often referenced post-intervention (17% of residents pre vs. 74% post; $p=0.0003$). Post-intervention, more residents felt comfortable with their knowledge of exam costs (4% pre vs. 74% post) and discussing costs with patients (9% pre vs. 61% post), and more residents valued the ACR AC (65% pre vs. 96% post); p-values all <0.05 . All residents found the curriculum helpful and 91% planned to change their ordering practices. At 3-11 months post-intervention, 78% referenced the AC at least monthly; 67% reported changing ordering practices due to the curriculum. Knowledge scores remained significantly improved. This curriculum was well-received and produced durable change in knowledge and attitudes towards high-value radiological exam ordering and use of the ACR AC. We believe a factor of its success was the engagement of residents with the utilization of different

learning styles and reinforcement of concepts through various formats (didactic sessions, group discussion, problem-based learning). Also, it promoted ongoing, self-driven learning as it equipped learners with a resource that they can continually reference. Given residents' reported sustained change in ordering practices, the curriculum shows strong potential to influence downstream ordering practices. It is currently being piloted with faculty hospitalists.

IMPLEMENTATION OF A SOCIAL DETERMINANTS OF HEALTH CURRICULUM FOR INTERNAL MEDICINE RESIDENTS AT THE UNIVERSITY OF ROCHESTER MEDICAL CENTER

Mahala Schlagman; Clare Park; Carlos Irwin Oronce. University of Rochester Medical Center, Rochester, NY. (Control ID #3170695)

NEEDS AND OBJECTIVES: The ACGME requires residency programs to provide training that includes "an understanding of health care disparities." Despite this mandate, few formal curricula exist to teach residents about health disparities. Our goal was to develop a social determinants of health (SDH) curriculum to teach internal medicine (IM) residents at the University of Rochester Medical Center (URMC) about the patient population they serve and provide an introduction to the social services that are available to help facilitate health. Once established, we plan to make our curriculum available to other residency programs locally and nationwide.

SETTING AND PARTICIPANTS: Rochester, NY has the most individuals living below half the federal poverty level of any mid-sized city in America. The URMC is home to the largest IM resident practice in the city, which serves 73% Medicaid or dual-eligible individuals.

DESCRIPTION: We developed a curriculum to educate residents about SDH. Modules include: introduction to SDH and impact on health in the city of Rochester, poverty, introduction to health policy, transportation, structural racism, SDH screening, and medical legal partnerships. The program was implemented within the existing ambulatory education sessions as part of the residency program requirements.

EVALUATION: 81% (56 of 69) of residents completed a survey following the first three sessions. Responses were tallied using average Likert scales and word-association pattern development. Of residents surveyed, 96.4% reported an increase in their comfort with an underserved patient population. In free-response answers, 24.6% reported an increase in understanding or empathy for their patients, 33.3% indicated they would be more likely to consider patients' out-of-pocket costs, and 21.7% reported an increased awareness of available resources. Residents also felt increased awareness of how costs affect patient decision-making and the social factors that affect access to care. An additional survey will be administered after curriculum completion.

DISCUSSION / REFLECTION / LESSONS LEARNED: The SDH curriculum increased resident empathy for our underserved patients, helping many of them commit to patient care that considers individuals within their social context. Development of the program required identification of a faculty champion and buy in from program leadership to prioritize these topics within the already robust IM curriculum. Our results provide important preliminary data to guide curriculum advancement.

IMPLEMENTATION OF A TRAUMA INFORMED CARE PRE CLINIC CONFERENCE CURRICULUM FOR RESIDENTS IN A COUNTY HOSPITAL

Giulia Leggett; Alejandro Diaz; Katherine Dang. Highland Hospital, Oakland, CA. (Control ID #3154900)

NEEDS AND OBJECTIVES: Adverse childhood experiences (ACE) and trauma impact roughly 61.7% of adults in California with likely increased proportions within the safety net network. We identified that the current Pre Clinic Conference curriculum did not address trauma identification and the concept of trauma informed care. Given the fact that residents working in our safety net primary care clinic have daily contact with survivors of trauma, the aim and objective of this project was to evaluate and implement a new Pre Clinic Conference Curriculum which would focus on trauma informed care.

SETTING AND PARTICIPANTS: This 20 minute educational didactic lecture was implemented during regularly scheduled pre clinic conferences for Resident physicians between 4/2018 until 06/2018 in the outpatient clinic. A pre and post lecture questionnaire was emailed out to all eligible participants including PGY1, 2 and 3 requesting voluntary participation to assess baseline knowledge, effectiveness of the curriculum and obtain additional feedback.

DESCRIPTION: The educational curriculum was developed using a case based format followed by questions. The preceptor version included answers and additional probing questions to implement discussion. Our educational module highlighted two cases of patients with histories of ACE and various forms of trauma. Questions included illustrated the objective learning points with such examples: What is trauma? Is it appropriate to screen for trauma in a primary care setting? What is trauma informed care?

EVALUATION: A pre intervention questionnaire was administered asking questions with a three point likert scale to identify baseline knowledge and attitudes around trauma informed care. Some questions included: How familiar are you with Trauma Informed Care? How comfortable are you discussing with your patient their personal history of physical, emotional and sexual abuse? How familiar are you with the clinical and scientific findings of the Adverse Childhood Experiences (ACEs) Study? An identical post intervention questionnaire was administered to assess for any difference in knowledge or attitudes. A mixed effects model was used to calculate the difference in mean total scores and showed a significant change between PGY3 and the aggregate.

DISCUSSION / REFLECTION / LESSONS LEARNED: We found that the Trauma Informed Care Pre Clinic Conference module our group developed was an effective teaching tool which was well received by learners. Total difference between pre and post survey scores was noted to have a p value of <0.001 indicating significant change in knowledge and attitudes. Notably, our faculty found the module to be a fast, effective, and easy way to implement teaching on the critically important subject of trauma informed care. In summary, this project illustrates the recognition of developing a Trauma Informed Care curriculum within our county system and the success of implementation through a Pre Clinic Conference module.

IMPLEMENTATION OF AN ONLINE CASE-BASED CLINICAL REASONING CURRICULUM

Michelle Fleshner¹; Ben Smith²; Joseph M. Rocco³; Thomas Painter³.

¹UPMC, Pittsburgh, PA; ²UPMC Presbyterian Shadyside, Pittsburgh, PA, PA; ³University of Pittsburgh, Pittsburgh, PA. (Control ID #3185469)

NEEDS AND OBJECTIVES: 1. To improve availability of standardized clinical reasoning education for learners of all levels. 2. To create a case-based clinical reasoning curriculum distributed online to promote learner engagement. 3. To determine the best means for curriculum distribution both internal to and external to our institution.

SETTING AND PARTICIPANTS: This project was initiated by the University of Pittsburgh Department of Medicine's (UPMC) Clinical Reasoning Group. The curriculum was initially geared towards UPMC Internal Medicine

residents and later distributed on social media to interested learners of different levels.

DESCRIPTION: The curriculum was based on learning objectives chosen by the Clinical Reasoning Group, which are in line with those promoted by the Society to Improve Diagnosis in Medicine. Cases were selected to exemplify potential biases that could lead to diagnostic error. Each case was organized into sections separated by multiple-choice questions that prompted learners to prioritize their differential diagnosis and work up decisions. The online survey platform Qualtrics was utilized and cases are distributed monthly via email to residents and faculty at UPMC and also via Twitter for open participation and discussion. Each case takes 5-6 minutes to complete. Data collected includes number of persons completing each case and means of accessing the case.

EVALUATION: Three cases were distributed via email to Internal Medicine Residents, Faculty, and medical students at UPMC over three months. The cases were also distributed on Twitter by an educational account. The number of participants for cases one, two, and three were 152, 183, and 246, respectively. Participants were surveyed at the end of the case to determine how they accessed the cases and to provide feedback. The proportion of participants accessing the case from Twitter increased each month. Participants indicated that they would appreciate more review of evidence-based testing, disease pathology, and mechanistic learning within the cases.

DISCUSSION / REFLECTION / LESSONS LEARNED: An online survey platform is an effective way to distribute clinical reasoning cases for educational purposes. The number of participants has steadily increased since initiation and feedback has overall been positive. In general, participants appreciate the accessibility of cases on smartphones, their brevity, and the interactive nature of the cases. Both email and social media have been effective platforms for distribution, but social media may have the ability to distribute educational materials more widely.

ONLINE RESOURCE URL (OPTIONAL): <https://docs.google.com/document/d/11Xuk4fqk55QFLVXs6GLgc5kmb7VhdLuy0YDOQVGw-QY/edit?usp=sharing>

IMPLEMENTATION OF TELEPHONE VISITS IN A RESIDENCY CLINIC: A STRATEGY TO BUILD TELEHEALTH SKILLS, IMPROVE PATIENT OWNERSHIP, AND ENHANCE CONTINUITY

Jenna Laughlin¹; Zehra Hussain¹; Gretchen Rickards¹; Sarah Schenck¹; John Donnelly². ¹Christiana Care Health System, Wilmington, DE; ²Christiana Care Health System, Newark, DE. (Control ID #3185420)

NEEDS AND OBJECTIVES: As primary care moves towards patient-centered care models, alternatives to the traditional in-person clinic visit are becoming increasingly utilized. Scheduled telephone visits are a convenient, effective method to deliver care. We piloted a telephone visit initiative in our residency clinic to develop telehealth skills in our trainees. We hoped that this novel visit type would also increase patient ownership and provider-patient continuity.

SETTING AND PARTICIPANTS: Since October 2016, nine internal medicine residents from our 36-resident categorical medicine program have had dedicated openings for telephone visits built in to their outpatient clinic schedule.

DESCRIPTION: Each resident had one hour of dedicated time per week templated into their clinic schedule for telephone visits. Depending on level of training, up to three telephone visits could be conducted during this protected time. Openings that went unfilled were converted into acute office visits. With regard to supervision, PGY1 residents received direct attending supervision for all visits. PGY2s were required to discuss all cases with the preceptor, and PGY3s discussed cases only as needed. All notes were routed to and co-signed

by the preceptor, who provided immediate guidance and feedback to residents. **EVALUATION:** Measures included resident surveys as well as continuity data obtained through chart reviews. Seven residents were surveyed about their experience providing telephone visits; 2 of the original 9 participants were excluded because they had left the institution. The response rate was 86% (6/7 residents surveyed). All respondents reported that these visits increased their patient ownership, allowed them to build rapport with patients, and that the level of supervision they received was appropriate. With regard to continuity, out of the 273 telephone visits scheduled, 179 (65.6%) were with the patient's PCP and 71 (26.0%) were within the PCP's firm.

DISCUSSION / REFLECTION / LESSONS LEARNED: We encountered several scheduling and supervision challenges during our pilot. Unused phone visits were initially all automatically converted to acute visits, which was overwhelming for PGY1 residents. We have thus adjusted this scheduling practice. Because inappropriate patient bookings occurred when staff had scheduling access, we now limit scheduling of telephone visits to the provider only. We found supervision to be easiest when all resident telephone visits were scheduled at the same time. We did not bill for telephone visits, although residents did learn about current and upcoming opportunities for reimbursement.

IMPROVING EASE OF ACCESS TO CLINICAL INFORMATION WITH A HOSPITAL-SPECIFIC INTERNAL MEDICINE ANDROID MOBILE APPLICATION

Matthew Gerling, University of New Mexico, Albuquerque, NM. (Control ID #3172469)

NEEDS AND OBJECTIVES: Recognize that the majority of Resident Physicians in the United States are from the Millennial Generation, 92% of whom carry a smart phone. Recognize the opportunity that smart phones provide for demand-based access to important hospital system-specific clinical and administrative information.

SETTING AND PARTICIPANTS: Setting: A single large academic medical institution consisting of an academic/community hospital and a Veterans Affairs hospital. Participants: Internal Medicine residents and rotating medical students.

DESCRIPTION: In September 2018, I developed an Android application called "VA Night Call" for Internal Medicine housestaff and students and made it available for free download on the Google Play store. Information provided in the application was intended to be specifically for the interns' night call shift. With the success of the VA Night Call app, I created a program-specific Internal Medicine Android app published on Google Play on November 30th, 2018. It includes hospital-specific information divided by subspecialty service as well as rotation-specific information. The app has current information under the Wards Handbook, Resident Wellness, VA Night Call, Infectious Diseases, and Palliative Medicine categories and may be accessed for free at <https://play.google.com/store/apps/details?id=com.UNMIMResources.unmimresources>

EVALUATION: Before downloading the VA Night Call app, surveys were administered to interns during their orientation. The same questionnaire was then administered at the end of the rotation, after they had downloaded and used the app. Interns reported being more confident in their medical decision making with the use of the app. Additionally, senior residents reported multiple cases where they have seen interns using the New Mexico VA Night Call application while on their inpatient medicine rotation. As of December 29th, there are 15 active installations of the app on unique devices. Our residency program has 39 interns, indicating a 38% participation rate. Currently, I am working to reprogram the app into Swift so that it can be published in the

Apple Store and made available for download by interns and residents who have iPhones. Interest in the app has spread beyond the Internal Medicine department, as several faculty members from other departments have expressed their interest in retooling its code for use in the development of apps for their respective residency programs.

DISCUSSION / REFLECTION / LESSONS LEARNED: As of December 29th, there are 15 active installations of the app on unique devices. Our residency program has 39 interns, indicating a 38% participation rate in use of the app. Currently, I am working to reprogram the app into Swift so that it can be published in the Apple Store and made available for download by interns and residents who have iPhones. Interest in the app has spread beyond the Internal Medicine department, as several faculty members from other departments have expressed their interest in retooling its code for use in the development of apps for their respective residency programs.

IMPROVING HIGH-RISK PATIENT HANDOFFS IN A RESIDENT PRIMARY CARE CLINIC

Emily Fessler, Hospital of the University of Pennsylvania, Philadelphia, PA. (Control ID #3183613)

NEEDS AND OBJECTIVES: The majority of Internal Medicine (IM) residency programs do not have a formal outpatient handoff process, though every 3 years graduating residents must transition their primary care panel to a new provider. In our resident clinic, current practice is for senior residents to select high risk patients in the spring using clinical judgment, and provide a warm handoff to an assigned junior resident. There is no protocol in place to guide patient selection, the content or format of the handoff, or to ensure that patients establish care with the receiving resident. This study will characterize patients deemed high risk by graduating residents and assess follow up surrounding the year-end transition to develop a handoff system that will reduce lapses in care.

SETTING AND PARTICIPANTS: High risk patients in a resident primary care clinic.

DESCRIPTION: Charts reviewed for 54 patients selected as high risk by 2017 graduating IM residents. Data collected re: comorbidities, healthcare visits in the year prior to handoff, and follow up after handoff. Handoff protocol developed to address identified gaps in care.

EVALUATION: High risk patients varied in age (median 64, 26-93) and had an average of 3 significant comorbidities; 50% carried a psychiatric diagnosis. Patients also varied in healthcare utilization in the year prior to handoff, with 1-19 clinic visits (median 4), 0-11 ED visits, and 0-7 admissions. 44% had a transitions of care note in the medical record. At 1 year, only half of patients had seen the resident who received their high risk sign-out. 20% established care with a different clinic provider, and the remainder were lost to care or left the clinic. The median time between last primary care (PCP) visit prior to year-end transition and first PCP visit post-transition was 7.7 months (1.9-26.4). Many were seen for another visit type (e.g. CRNP) in the interim.

DISCUSSION / REFLECTION / LESSONS LEARNED: Based on this data, the following clinic handoff will be implemented (1) Patient selection: Many of these patients would not be identified based on standard quality metrics. Residents will continue using clinical judgement to identify their highest risk patients. (2) Format: 50% of high risk patients were never seen by the resident who received their handoff, and many saw other practitioners before a new PCP. Handoff must therefore be available in the medical record. "High risk patient - see dd/mm/yy transitions note" will be added to the problem list. (3) Content: A handoff note template will include reason for selection, medical summary/pending tasks, and psychosocial context. (4) Tracking: Residents will create an Epic list of high risk patients early in senior

year. List will be used to collate pending tasks and ensure that follow up is scheduled prior to handoff. Graduating residents will be paired 1:1 with a junior resident and share patient list. Junior resident will then monitor to ensure patients seen by a new PCP. This should reduce lost information, and decrease time between last pre-transition PCP visit and first new PCP visit.

IMPROVING HYPERTENSION IN AFRICAN AMERICANS: IMPLEMENTATION OF A QI CLERKSHIP ADDRESSING HEALTH EQUITY

Christopher Bautista¹; Christopher Cai²; Carmen Lee²; Jordie Martin²; Isabel Ostrer²; Noemi Plaza²; Ethan Zaccagnino². ¹University of California, San Francisco, San Francisco, CA; ²University of California, San Francisco School of Medicine, San Francisco, CA. (Control ID #3163556)

NEEDS AND OBJECTIVES: Medical schools are incorporating health systems science into curricula, including quality improvement (QI), population health, and social determinants of health. While most medical schools have curricula that address health disparities, the intensity and quality of curricula vary. QI and health disparities competencies are naturally aligned, providing an opportunity for innovative curricular implementation.

SETTING AND PARTICIPANTS: At the University of California, San Francisco, all pre-clinical students participate in a longitudinal "clinical microsystems clerkship" focused on QI. Six pre-clinical medical students were assigned to a small group, guided by a faculty "coach" in a primary care clinic (the clinical microsystem) in San Francisco. Students met in the microsystem for one afternoon weekly over 13 months.

DESCRIPTION: The QI project chosen by the students in consultation with faculty coach addressed the disparity in hypertension control rates in African American patients compared to non-African American patients in the primary care clinic. Students were tasked to complete a "systems improvement template" (A3). Following this template, the students clarified the problem, and performed background, current state, and gap analyses, using local data and inter-professional interviews. They designed and implemented a telephone patient outreach intervention to identify gaps and facilitate patient follow up. Students completed 2 PDSA cycles.

EVALUATION: Educational impact: All 6 students successfully passed the QIKAT administered to all students; completed, designed, and implemented a QI intervention; and completed the systems improvement template. Work was disseminated as a poster in a QI symposium and recognized as one of the highest impact QI projects in the health system. The students gave an oral presentation at QI symposium. Clinical Impact: Telephone outreach protocol was developed and used to guide future outreach efforts. About 70 patients were included in the intervention, with 30% improvement in hypertension control in this group at the end of the study period.

DISCUSSION / REFLECTION / LESSONS LEARNED: Pre-clinical medical students learned and practiced QI by addressing a health disparity in hypertension control for African American patients. By choosing this gap, students learned about issues around health equity, including access to care, diversity and inclusion, and racial inequity. Pre-clinical students participated in direct patient care, reinforcing communication and doctoring skills. Their work had an observable and significant impact in improving the health of patients and addressing health inequity.

IMPROVING INTERN EFFICIENCY THROUGH LAPTOP BASED ROUNDING IN FLOW

Heather Balch; Casey Gradick. University of Utah School of Medicine, Salt Lake City, UT. (Control ID #3180323)

NEEDS AND OBJECTIVES: The most common method used by residents to round on hospitalized patients involves batched work-flow (i.e. reviewing all patients in the computer, then rounding on all patients, then placing orders, then doing notes). This creates redundancy, which can reduce residents' efficiency, and lead to duty hour violations, decreased resident satisfaction, and delayed completion of patient care activities. To address this we implemented a novel work-flow intervention aimed to improve resident efficiency.

SETTING AND PARTICIPANTS: The study took place on the inpatient general medicine teams at the University of Utah. These teams are comprised of an attending, a senior resident, and 2-3 interns. The work-flow intervention was implemented on 1 team for 3 months (13 interns), and 2 other teams were controls (21 interns).

DESCRIPTION: Residents on the intervention team were provided a recommended work flow (see URL), and their own laptop to allow them to round "in-flow" (i.e. doing all the work for one patient before moving on to the next). The interns pre-rounded with the laptops and then presented from them, which decreased the amount of written information. Orders and notes were then completed during rounds.

EVALUATION: There were 3 parts to the evaluation: a time in motion (TIM) study, subjective survey data, and EMR data (formal analysis underway) on progress note completion, order, and discharge times. The TIM study included 14 intern days, 7 each of the control and intervention work-flows. Once averaged, the interns on the intervention team (IT) spent 30 more minutes per day on direct patient care, 30 minutes less on computer time, and 15 more minutes on education, compared to those on a control team (CT). 38% (5/13) of interns on the IT and 48% (10/21) of interns on the CT responded to the post-intervention survey. Full analysis of this data is underway, but raw data shows the following differences: 80% vs 30% thought that orders discussed on rounds were always placed before 1230; 80% vs 40%, said that all, or most, of their progress notes were done before 1230; 60% vs 10%, said they were always able to leave the hospital by 7PM. Additionally, respondents from the IT compared to the CT felt better prepared on rounds, thought that they knew their patients better, and wrote less info down before rounds.

DISCUSSION / REFLECTION / LESSONS LEARNED: Since the implementation of the EMR, the majority of interns' work is now done on the computer, but the structure of rounding and pre-rounding has changed little. Our preliminary survey data show that increasing access to reliable, fast, and mobile workstations, in addition to encouraging a more in-flow style of rounding, led to decreased redundancy, improved resident efficiency with progress notes, order entry, and leaving the hospital in a timely manner. Our time-in-motion study suggests that the intervention may also have increased time for direct patient care, decreased overall time on the computer, and given more time for education, though this is likely not statistically significant.

ONLINE RESOURCE URL (OPTIONAL): <https://goo.gl/SDBWN1>

IMPROVING MEDICAL STUDENT BEHAVIOR AND SKILLS TOWARDS ADDRESSING SOCIAL DETERMINANTS OF HEALTH (SDOH)

Haeyeon Hong²; Daniel Sylvester²; Stephanie Losi³; Marna Stack⁴; Mara Eyllon²; Arvin Garg³; Nancy R. Kressin⁵; Priya S. Garg²; Jodi Abbott²; Lindsay B. Demers²; Thea James⁶; Pablo Buitron de la Vega¹. ¹Boston Medical Center / Boston University, Dorchester, MA; ²Boston University, Boston, MA; ³Boston Medical Center, Boston, MA; ⁴Boston University School of Medicine, Boston, MA; ⁵Dept of Veterans Affairs and Boston University, West Roxbury, MA; ⁶Boston Medical Center, Cambridge, MA. (Control ID #3172896)

NEEDS AND OBJECTIVES: Addressing the SDOH for patients is critical to providing high-quality care. SDOH are usually taught as immutable realities rather than actionable circumstances that should be addressed with specific tools. As a result, medical students are underprepared to address the SDOH. To address this gap, we developed a quality improvement initiative for third-year medical students (MS3s) at Boston University School of Medicine with the goal of improving their behaviors and skills towards addressing SDOH.

SETTING AND PARTICIPANTS: MS3s rotating through Internal Medicine 8 week inpatient clerkships at Boston Medical Center (BMC). An SDOH screening and referral model called THRIVE, adapted from the WECARE model, has been implemented at BMC primary care clinics. THRIVE is unfamiliar to emerging medical students and has not previously been used in inpatient settings.

DESCRIPTION: Starting in July 2018 MS3s screened and referred patients for eight SDOH domains and then followed-up with their progress through phone calls. During orientation, MS3s learned how to use the THRIVE screening tool and the THRIVE Directory (BMC's web-based repository of resources to help patients with social needs). MS3s followed-up by phone 1-2 weeks after each patients' hospital stay to determine if they were able to receive support for identified SDOH needs.

EVALUATION: We held huddles with MS3s at the end of their rotation to explore feasibility and acceptability of the experience. Additionally, we used a pre and post survey to examine the impact of this activity on MS3's behavior and skills towards addressing SDOH. During huddles, the majority of MS3s mentioned having no trouble with the screening and referral process. Barriers included difficulty documenting responses in the Electronic Health Record, lack of formal training on calling patients to follow up about connecting to resources, and lack of experience collaborating with social workers. We performed a series of sign tests to compare students' behavior and perception of skills before and after participating in THRIVE. Twenty-four MS3s completed the pre and post survey. Overall, THRIVE had a significant positive impact on enabling MS3s to ask patients about social needs ($p < .001$). THRIVE also significantly impacted students' confidence in providing resources to help patients with their social needs ($p < .001$). Although it was not statistically significant, there is a trend showing that participation in THRIVE improved students' confidence in asking patients about their social needs ($p < .1$). There was no statistically significant change in MS3s perceptions regarding the importance and their role in addressing SDOH.

DISCUSSION / REFLECTION / LESSONS LEARNED: The initiative significantly improved students' asking patients about their social needs and confidence providing resources to help mitigate these needs. We learned that students need further education in understanding how to discuss addressing patients' social needs. These skills should be learned and simulated prior to starting their clerkship rotations.

IMPROVING RESIDENT POPULATION HEALTH EDUCATION AND CARE THROUGH TEAM-BASED QUALITY IMPROVEMENT

John P. Shoup¹; Azalea Kim²; Benjamin L. Ranard³; Jonathan Wilson³; Jane Pendergast³; Joel C. Boggan⁴. ¹Duke University School of Medicine, Durham, NC; ²Duke Health, Durham, NC; ³Duke University, Durham, NC; ⁴Duke University Health System, Durham, NC. (Control ID #3186388)

NEEDS AND OBJECTIVES: There is an urgent need to equip physicians with the knowledge and skills to manage population health to succeed in a landscape shifting to value-based-care contracts. We sought to improve the

preparedness of residents to provide high-value, population-focused care through a combination of didactic and practice-based learning.

SETTING AND PARTICIPANTS: Internal Medicine residents at a large, quaternary-care academic medical center and an associated resident continuity clinic.

DESCRIPTION: We surveyed Internal Medicine, Med-Peds, and Med-Psych residents to assess confidence in providing population-based healthcare. Specifically, residents were asked to assess their confidence in defining population health, identifying gaps in patient care, creating a strategy to address gaps without in-person visits, managing a shared patient panel, leading an interdisciplinary team, and utilizing population health strategies following training. We developed and incorporated 5 hours of population-health didactics into the academic curriculum to address these topics. Practice-based learning will be facilitated through a shared patient panel of a "practice partnerships" (PP) of an intern, second, and third year resident. We created an EPIC-based dashboard to report PP performance on population health metrics and identify patients with gaps in care. Each partnership selected one of three metrics to target: colorectal cancer (CRC) screening, statin prescription in diabetics, or patients with A1C > 9. Participants had one administrative half-day session exclusively focused on improving their target metric. All PPs received quarterly control-charts of longitudinal performance.

EVALUATION: 75% (n = 133) of residents completed the initial survey. Less than 25% of surveyed residents reported confidence on most population health topics. Residents reported most confidence in identifying patients who were not up-to-date on routine care (40.6%, n = 54), but only 13.5% (n = 18) reported confidence in creating a plan to address gaps in care. Only a reported race of "Other" was associated with higher odds of confidence in creating a care plan as compared to white respondents (OR 3.44, 95% CI 1.03-11.46) after adjusting for measured characteristics. There was no significant impact of sex, PGY year, anticipated future practice, or having an additional advanced degree. Among PPs, 9 selected statin prescription in diabetics, 10 CRC screening, and 1 uncontrolled diabetes. PP's received quarterly updates in the form of p-charts. Follow-up surveys together with metric performance at one year will be collected.

DISCUSSION / REFLECTION / LESSONS LEARNED: Surveyed internal medicine residents reported a lack of confidence in all population health related topics, and are not confident creating a care plan to address gaps in care.

IMPROVING WEIGHT MANAGEMENT SKILLS IN TRAINEES Noor Khan, UPMC Mercy, Moon Township, PA. (Control ID #3184901)

NEEDS AND OBJECTIVES: Overweight and Obesity affect 69 % of the US adult population and contribute greatly to many other conditions. Obesity is a disease that often goes unaddressed in primary care visits. Barely a quarter of physicians report feeling adequately trained in weight management and fewer than 30% of medical schools meet the minimum hours of nutrition education recommended by the National Research Council. We developed a curriculum that introduces trainees to principles and practice of weight management and improves their confidence in addressing this condition.

SETTING AND PARTICIPANTS: Participants were third year (PGY3) Internal Medicine Residents at an outpatient clinic. We implemented a curriculum emphasizing didactics, small group discussions and patient care during the 4-week ambulatory rotation. A total of 22 residents have participated in this curriculum from November 2017-December 2018.

DESCRIPTION: Patients with Obesity were scheduled for weight

management visits during a half-day session during the PGY3 ambulatory rotation. Residents were asked to review material on evaluating obesity and to take an Implicit Association Test (Project Implicit) to increase awareness of subconscious bias prior to the session. Patients were evaluated, counseled and managed by a team consisting of the resident and a trained (American Board of Obesity Medicine certified) faculty member. Counseling skills, motivational interviewing and patient centered decision making was modeled by the faculty. At the end of the patient care session, small group discussions reinforced lessons learnt. Weight management specific didactic sessions included a 30-minute Pre-Clinic conference during the Ambulatory Rotation for all residents and the addition of 2 noon conferences to the annual schedule. Residents were encouraged to schedule weight management visits for patients on their continuity panel throughout the year.

EVALUATION: Participating PGY3 residents rated their comfort level with managing obesity before and after the half-day session and evaluated other aspects on a 5-point scale. The mean score for the overall experience was 4.7. The mean self-reported comfort with weight management was 2.4 before the session, improving to 4 post-session (p value of < 0.0001 , Wilcoxon signed rank test).

DISCUSSION / REFLECTION / LESSONS LEARNED: This successfully implemented curriculum demonstrated how dedicated weight management visits along with a few didactic sessions can substantially improve resident confidence. Similar interventions can be implemented at other programs interested in addressing this knowledge and training deficit in trainees without committing too much valuable residency time. There is a need to train more faculty members in weight management. Residents should be encouraged to treat patients with obesity in an evidence based proactive manner throughout their training to solidify weight management skills. We need to assess whether residents will continue to apply lessons learned after completing this curriculum.

INCREASING CONNECTION AND ENGAGEMENT: A STUDY OF PEER-LED REFLECTION GROUPS FOR FELLOWS.

Arabella L. Simpkin^{1, 2}; Susan Hata^{1, 2}; Merranda Logan^{1, 2}; Katrina Armstrong^{1, 2}. ¹Massachusetts General Hospital, Boston, MA; ²Harvard Medical School, Boston, MA. (Control ID #3185763)

NEEDS AND OBJECTIVES: Burnout appears to be an accelerating phenomenon, with implications for physician wellbeing, patient safety, and the quality of healthcare delivery. While many studies and interventions been directed at medical students, residents, and faculty to better understand what impacts burnout, subspecialty fellows have been largely untargeted, despite being a vulnerable population, critical to the future of patient care. Fellowship training presents unique challenges, often coinciding with geographic uprooting, increased responsibility, pressure to enter the job market, and loss of the team structure that can define residency. To tackle the goals of reducing burnout, increasing engagement, inclusion and belonging, we have created a program that creates small communities of fellows, who will gather to reflect on meaningful and challenging aspects of their work, and support one another.

SETTING AND PARTICIPANTS: Sub-specialty fellows at Massachusetts General Hospital from the Department of Medicine. Peer support groups will convene for one hour, every 2 weeks, in a centrally located room on the main campus.

DESCRIPTION: Innovative program with 8-10 interdisciplinary fellows gathering on a two-weekly basis for a self-facilitated peer-support group with a provided discussion guide.

EVALUATION: All participants complete surveys at the beginning and end of the study to measure: work engagement; empowerment at work; resilience;

reaction to uncertainty; and burnout. Baseline surveys show 32% of fellows meet criteria for burnout.

DISCUSSION / REFLECTION / LESSONS LEARNED: We have experienced challenges in fellows being able to attend the lunchtime sessions, despite positive feedback about the endeavor. Fellows have a set of unique demands that ironically puts them at huge risk of burnout whilst impeding their ability to attend structured wellness sessions: unpredictable and changing patient volumes make regular sessions on a standardized day an impossibility; consults are increasingly complex; voicing concerns about overwhelming workloads can feel unwise given fellows are often looking for faculty jobs in the institution. Recommendations to overcome these challenges include: connecting fellows to mentors and coaches outside their divisions; flexibility in timing and composition of peer-support groups; connecting fellows from different sub-specialties and years to nurture vertical associations.

INCREASING HEALTH PROFESSION STUDENTS' INTERPROFESSIONAL COMPETENCIES: THE INTERPROFESSIONAL DEDICATED EDUCATION UNIT (IPDEU)

Rachel Jantie¹; Victoria Hornyak¹; Cassandra Leighton¹; Teresa Pacella¹; Rosemary Hoffmann¹; Sandra Engberg¹; Subashan Perera¹; Susan Meyer¹; Benjamin Reynolds¹; Debra K. Weiner¹; David M. Elnicki²; Alton E. James^{1, 1}; Rollin M. Wright¹. ¹University of Pittsburgh, Pittsburgh, PA; ²University of Pittsburgh, Wexford, PA. (Control ID #3177640)

NEEDS AND OBJECTIVES: Many health professionals work in interprofessional (IP) teams to care for older adults with complex needs. Interprofessional education (IPE) is now required for health profession students, but the best educational model is unknown. Further, clinical preceptors are often untrained in IPE themselves, creating heterogeneity in students' IPE experiences. To address these needs, we designed and evaluated an Interprofessional Dedicated Education Unit (IPDEU) acute care IPE experience for health profession students.

SETTING AND PARTICIPANTS: We designated a neurotrauma hospital unit (older population with complex needs) the IPDEU at our large academic medical center. Unit nurse, occupational therapy (OT), physical therapy (PT), and speech therapy (ST) providers were trained as IPE instructors in July-August 2018. Learners were University of Pittsburgh students from different health professions (3 audiology, 13 nursing, 8 OT, 9 PT, 9 ST, 8 physician assistant) who rotated on the IPDEU in fall 2018.

DESCRIPTION: We trained IPE instructors in both IP practice skills and IPE-specific instructor skills. Instructors completed 2 hours of web-based skill modules and 4 hours of skill practice with simulation-trained actors. Students from different health professions were paired. Each pair spent 2 half-day sessions on the IPDEU within a one-week period (1 with a nurse IPE instructor & 1 with a therapy IPE instructor). During IPDEU sessions, students actively observed their IPE instructors during usual patient care activities. Active observation explicitly focused on IP aspects of care (not clinical skills) and was facilitated through instructor techniques such as IPE-directed questions and thinking-out-loud. A 30-minute group debrief concluded each session.

EVALUATION: Students self-rated their IP competencies using the Interprofessional Collaborative Competency Attainment Scale (ICCAS) before/after the IPDEU experience. Pre/Post composite ICCAS scores were analyzed by independent t-tests. Pre/Post individual item Likert responses were dichotomized and analyzed by χ^2 . Fifty students completed the experience. Twenty-seven (54%) reported prior formal IPE. Composite ICCAS scores improved post-IPDEU (65.3 vs 81.5, $p<0.0001$). Pre-IPDEU, few students rated individual competencies highly (<70% rated themselves Very Good or Excellent on any item). Post-IPDEU, all item competency ratings improved significantly

(*p*-values ranged 0.02 to <0.0001). Areas of greatest improvement were IP team utilization, communication, roles, and providing constructive team feedback. Sample size limited subset analyses.

DISCUSSION / REFLECTION / LESSONS LEARNED: Despite most students reporting prior IPE exposure, few IP competencies were rated highly at baseline. All competency ratings improved significantly post-IPDEU, suggesting the experience improved confidence in knowledge, skills, or both. Next steps will assess long-term competency retention, evaluate differences between professions and levels of pre-existing clinical experience, and explore thematic content of student debriefs.

INCREASING RESIDENT COMPETENCE AND CONFIDENCE IN RESUSCITATION LEADERSHIP

Nathan T. Douthit¹; Christine McBride^{2, 1}; Erin Townsley¹. ¹Brookwood Baptist Health, Birmingham, AL; ²Virginia College Of Medicine, Auburn, AL. (Control ID #3185223)

NEEDS AND OBJECTIVES: Internal Medicine (IM) residents are experiencing fewer cardiopulmonary resuscitations. Most are intimidated by leading a resuscitation. Many IM residents go to careers in hospital medicine, where competence and confidence in resuscitations are essential qualities.

SETTING AND PARTICIPANTS: This intervention took place in a community hospital residency training program. Included participants were all categorical internal medicine residents from the 2017/2018 and 2018/2019 academic years. (n=39)

DESCRIPTION: 12 months of records were reviewed in order to determine the outcomes of resident-led resuscitations compared to other resuscitations led by hospitalist and intensivist. Variables measured were ROSC, survival to discharge (sDC), time of event, and location of event. Surveys assessing resident confidence were distributed before and after an intervention. The intervention consisted of a "Code Conference" which took place 8 times in the academic year. It featured a simulation led by an intern and a high-yield resuscitation topic lecture. Staff from the intensivist, nursing, and pharmacy services were all present and provided immediate feedback after the simulation. Outcome data was tracked during the intervention and compared to the pre-intervention data. Data was analyzed using SAS 9.4. **EVALUATION:** On a 0-5 Likert scale, PGY-2 residents in 2018 compared to PGY-2 residents in 2017 did not show an improvement in confidence following orders during a resuscitation (averages of 4.75 pre and 4.375 post). In contrast they did show an increase in confidence in leading a resuscitation (2.5 pre and 4.125 post) and teaching others how to lead a resuscitation (2.5 pre and 3.125 post). In the post intervention survey, residents gave the intervention an importance rating of 4.5 on a 0-5 scale. Resident ROSC improved (63.27% compared to 79.17%; *p*=0.10) and sDC were stable (16.33% compared to 16.67% *p*=0.90) despite decreases in the hospital wide rates between the two years of ROSC (72.85% pre and 68.28% post) and sDC (21.19% pre and 17.24% post).

DISCUSSION / REFLECTION / LESSONS LEARNED: Limitations included the small sample size and inability to quantify resuscitation complexity. Despite these limitations, there was an improvement in resident competence with a positive trend. Despite the decrease in ROSC and sDC in the hospital, residents had more success in ROSC and stable rates of sDC. Residents confidence increased and they viewed the intervention as extremely important to their IM training. These code conferences are a low-cost multidisciplinary intervention that can be used to improve resident confidence and competence in leading resuscitations, an important part of internal medicine education.

INNOVATION IN INPATIENT HIV EDUCATION: A FLEXIBLE FLIPPED CURRICULUM

Mollie B. Tucker; Merceditas Villanueva. Yale School of Medicine, New Haven, CT. (Control ID #3178593)

NEEDS AND OBJECTIVES: The Inpatient Infectious Disease (ID) Rotation provides an opportunity for residents to learn about HIV management. Previously, teaching on the rotation was not standardized, partly due to constraints placed by intensive inpatient clinical needs. In the flipped classroom (FC) model, learners build a knowledge foundation outside of the classroom, while classroom time is devoted to knowledge application. We adopted a modification of the FC model, a flexible flipped curriculum (FFC), to provide residents with a standardized HIV curriculum with additional flexible topics, geared towards adult learners.

SETTING AND PARTICIPANTS: This curriculum was implemented on the Inpatient ID Service at Yale New Haven Hospital. The service consists of two teams, each team with an attending, resident, intern, and medical students. Participants rotate in 2- or 4-week blocks. All team members participated in the curriculum, and residents and interns were surveyed about their educational experience.

DESCRIPTION: The web-based curriculum consisted of 3 core modules and 8 optional modules. Each module contained "out-of-classroom" (OC) and "in-classroom" (IC) materials. OC materials included videos made by core ID faculty and links to articles from the AIDS Education and Training Center (AETC) National HIV curriculum. IC materials included relevant questions from the AETC question bank and links to cases from the New England Journal of Medicine. Teams were asked to complete all core modules and to choose optional modules based on relevance to active cases. Residents reviewed OC materials on their own, then engaged in IC question-based and case-based sessions led by their attendings.

EVALUATION: Implementation began in July 2018. Residents received pre- and post-tests designed to assess utilization and perceived effectiveness of the curriculum. In the first 6 months, 39 residents participated. Of those, 66.7% completed the pre-test and 53.8% completed the post-test. There was variation in utilization of modules. Overall, 28.5% preferred the FFC model, 19% preferred the classic teaching model, and 52.3% had no preference.

DISCUSSION / REFLECTION / LESSONS LEARNED: Residents generally appreciated the availability of a standardized curriculum. However, there remained variability in its utilization. Those who used the curriculum enjoyed the opportunity to apply knowledge with expert guidance. More widespread utilization was hampered by the ongoing challenge of finding time when all team members were available to hold IC sessions. Improving implementation of the curriculum, with attention to variable schedules of team members, is still needed.

INNOVATIONS IN CLERKSHIP ASSESSMENT: THE EARLY EXPERIENCES AT DELL MEDICAL SCHOOL

Sherine Salib¹; Stephanie Corliss²; Kimberly Brown²; Valli Annamalai²; Beth Nelson². ¹Dell Medical School, University of Texas at Austin, Austin, TX; ²Dell Medical School, Austin, TX. (Control ID #3163280)

NEEDS AND OBJECTIVES: A fairly ubiquitous challenge in the core clerkships is that of observing and assessing specific desirable medical student behaviors and skills in the clinical setting. Clarity in how those behaviors and skills are observed and assessed is an important and yet often elusive task, particularly with some of the less traditionally assessed characteristics that we seek to cultivate in our students, such as Clinical Curiosity, Initiative, Problem-Solving and Safety and Value considerations.

SETTING AND PARTICIPANTS: Dell Medical School has a robust 4 year clinical skills, leadership and value-in-healthcare curriculum. These skills are explicitly taught and assessed throughout the 4 years of medical school, including the core clerkships.

DESCRIPTION: Dell Medical School incorporates several longitudinal themes into its mission, including clinical skills, leadership and value and safety in healthcare. Creating an environment within the core clerkships where these competencies can be applied is challenging, both for students to demonstrate, and for faculty to recognize and assess. We have implemented several strategies and tools to assess those competencies in the clerkships. These tools align with the competencies outlined in the clerkship clinical performance assessment form, which includes competencies such as leadership, initiative, value and safety considerations, amongst others.

EVALUATION: At the end of the MS1 year, students rated themselves on their level of attainment of each DMS core competency. During the MS2 Clerkship, faculty assess students using the Clinical Performance Assessment Form. 1212 forms were completed for 50 students during clerkship rotations 1-3 of the 2017-2018 academic year. On the student self assessments, students assessed themselves the highest in the areas of "Emotional Intelligence & Situational Awareness", "Continuous Personal Improvement" and "Interprofessional Care". On the clinical performance assessment forms completed by faculty & residents, "Performance exceeds expectations" was selected in the highest percentages for Clinical Curiosity (40%), Emotional Intelligence and Situational Awareness (29%), Continuous Personal Improvement (25%) and Patient Safety (24%). Several items stood out as being difficult for faculty to assess, with "Not enough information to evaluate" being selected in responses for Patient Safety (35%), Problem Solving & Innovation in Healthcare (34%), and Healthcare System Context (31%) being the most challenging. Our data indicate that, with these tools, along with clear grading rubrics and ongoing faculty development, faculty are able to reliably and confidently assess most competencies, although some challenges remain.

DISCUSSION / REFLECTION / LESSONS LEARNED: Creating experiences to practice specific skills in the clinical setting, and implementing tools to observe and assess those behaviors and skills is imperative, but not always easy. This is particularly challenging with sub-competencies such as initiative, clinical curiosity, problem-solving and value and safety considerations.

INNOVATIONS IN POPULATION HEALTH MANAGEMENT: IMPROVING CERVICAL CANCER SCREENING RATES AMONG INTERNAL MEDICINE RESIDENT PATIENT PANELS

Phillip Yun¹; James Doolin¹; Jeanne Gosselin²; Rebecca Glassman². ¹Beth Israel Deaconess Medical Center, Cambridge, MA; ²Beth Israel Deaconess Medical Center, Boston, MA. (Control ID #3178425)

NEEDS AND OBJECTIVES: In June 2017, we identified a significant disparity in the cervical cancer screening rates among patients seen by internal medicine residents and faculty attendings, 66% and 80%, respectively, at Beth Israel Deaconess Medical Center's ("BIDMC") ambulatory clinic, Healthcare Associates ("HCA"). Our objective was to improve cervical cancer screening rates among patients seen by BIDMC's internal medicine residents. The first phase of our quality improvement project included a needs assessment and the development of our curricular intervention. Here, we report on the second phase of our project: preliminary outcomes from the first 12 months of our curricular intervention.

SETTING AND PARTICIPANTS: Our intervention was conducted within the internal medicine residency program at BIDMC's main primary

care clinic, HCA, in Boston, Massachusetts. We delivered our curricular intervention to 2nd and 3rd year residents during their ambulatory blocks in six-week cycles from November 2017-January 2019.

DESCRIPTION: After surveying residents on their understanding of cervical cancer screening, we designed a curricular intervention targeting perceived barriers. The curriculum was co-created by residents and attendings. The primary care track residents led the weekly sessions. The content included increasing awareness of ancillary support staff at HCA and proper navigation of population health tools and documentation. The intervention also included guided panel management time alongside HCA's outreach team to help identify and reach out to patients in need of pap smears.

EVALUATION: In order to evaluate the impact of the intervention, we focused on the residents who were in their 2nd year in June 2017. We tracked changes in the cervical cancer screening rates among their patients into September 2018. From June 2017 to September 2018, the cervical cancer screening rate for this group of residents increased from 63% to 70%. In addition, we administered a post intervention survey to 2nd and 3rd year residents beginning in December 2018. Preliminary results included responses from eighteen 3rd residents and seventeen 2nd year residents. When asked if they were more comfortable with population health after attending the curricular intervention, 33/35 (94%) agreed. When asked if they would recommend the curricular intervention to other internal medicine residency programs, 32/35 (91%) agreed. When asked if they were more comfortable with cervical cancer screening after attending the curricular intervention, 18/35 (51%) agreed.

DISCUSSION / REFLECTION / LESSONS LEARNED: We believe the increase in cervical cancer screening rates among resident patients from June 2017 to September 2018 is largely due to our curricular intervention, as no other large-scale intervention or practice change at HCA occurred during this time period. Our post intervention survey also supports this hypothesis as a majority of residents responded positively to our intervention.

INSULIN PRESCRIBING WORKSHOP: A BRIDGE BETWEEN PHARMACY AND PRIMARY CARE

David Kuo¹; Anthony J. Longo⁴; Olesya Taylor^{2, 3}; Christine Lam^{3, 1}; Rebecca A. Griffith². ¹Atlantic Health System, Morristown, NJ; ²Atlantic Health/ Morristown Medical Center, Morristown, NJ; ³Fairleigh Dickinson University, Bedminster, NJ; ⁴Atlantic Health, Little Falls, NJ. (Control ID #3176518)

NEEDS AND OBJECTIVES: Internal Medicine residents and medical students often have a strong conceptual knowledge about prescribing insulin but are often uncomfortable with real life skills required in managing insulin. Such skills include using proper insulin injection technique, proper glucometer technique, and being able to convert between different forms of insulin. Since the practical aspects of these skills are not routinely taught in medical school or even residency, we implemented a workshop to teach these skills to our medical students and residents.

SETTING AND PARTICIPANTS: Morristown Medical Center Internal Medicine Residency is a moderate sized program with 15 categorical residents each year and a clinical training site for three medical schools. The target audience for the workshop consisted of the residents and medical students currently rotating at the hospital. The workshop faculty consisted of ambulatory Internal Medicine faculty and an academic clinical pharmacy department which also has pharmacy residents and students from two schools. The one-hour workshop took place in lieu of a morning report session.

DESCRIPTION: The workshop consisted of three stations each led by either a primary care or pharmacy faculty member, with senior residents or

pharmacy students as junior instructors. The stations were: (1) how to use a glucometer, (2) how to use an insulin pen, and (3) how to calculate and write mixed insulin prescriptions. Each session lasted 14 minutes in duration. Equipment such as insulin pens, GLP-1 devices, glucometers and testing strips and lancets and skin models were provided by the clinical pharmacy department.

EVALUATION: The program was evaluated with a brief survey of the participants' self-reported confidence performing the skills taught during the workshop. The four-point scale ranged from "not at all confident" to "very confident." 27 residents participated in the workshop, with 17 completing the pre- and post-test survey. Of those completing the survey, 94% reported at least a one-point increase in their confidence in calculating a 30-day supply of insulin pens or vials; 88% reported at least a one-point increase in converting mixed insulin to a basal-bolus regimen and teaching patients how to use a glucometer; 76% reported at least a one-point increase in confidence level using an insulin pen.

DISCUSSION / REFLECTION / LESSONS LEARNED: Over 80% of diabetes patients are managed by primary care physicians, many without the support of an endocrinologist. In the absence of subspecialty support, most primary care physicians are comfortable prescribing oral diabetes drugs, but practical aspects of managing insulin and glucose monitoring are often relegated to nurses or pharmacists. In this workshop, residents and students learned common and fundamental insulin management skills which will help them better care for their diabetic patients.

INTEGRATED SONOGRAPHIC COMPETENCY AT NYU (I-SCAN): PROGRAM DESCRIPTION AND EARLY EVALUATION

Michael Janjigian¹; Anne Dembitzer² ¹; Caroline Srisarajivakul-Klein¹;

Khemraj Hardowar¹; Penelope Lusk¹; Sondra Zabar¹; Harald Sauthoff¹.

¹NYU Langone Health, New York, NY; ²VA NY Harbor Healthcare System, New York, NY. (Control ID #3168682)

NEEDS AND OBJECTIVES: Point-of-care ultrasound (POCUS), when integrated with a physical examination, increases accuracy of diagnosis and decreases procedural complications. However, most hospitalists have not been trained to use this new technology. We developed a year-long curriculum, the Integrated Sonographic Competency at NYU (I-Scan), to train hospitalists in POCUS.

SETTING AND PARTICIPANTS: Twenty-three hospitalists from across the 4 hospitals affiliated with NYU Langone Health participated. Sixteen of the participants (72%) reported prior ultrasound training, with a range of 2-80 hours (median = 4 hours); 3 reported more than 5 hours of prior training. Three reported active clinical use of POCUS though none of them had more than 5 hours of prior training. The group averaged 4.5 years of clinical practice (range = 1-13 years).

DESCRIPTION: The program began with an intensive 2-day course consisting of lectures and hands-on training on human models covering views of the heart, lungs/pleura, abdomen, and leg vasculature. We developed the remainder of the year-long program with the goal of helping participants retain and improve upon the skills acquired during the initial course. Our program included hands-on teaching sessions held at each institution by local experts, presentations at monthly conferences with the course director (HS), and online feedback on uploaded ultrasound images. To facilitate this final item, each participant was given access to portable ultrasound devices with the ability to upload ultrasound clips to a HIPAA-compliant website. Participants provided a clinical interpretation and assessment of image quality for each of their clips. The clips were then reviewed by an expert who provided feedback on both of these domains. Participants could then use these clips to create personal

portfolios in accordance with national standards set by the Society of Hospital Medicine.

EVALUATION: Participants rated the 2-day intensive program as very useful and satisfaction with the individual components of the program ranged from useful to very useful. Participants reported statistically significant increases in their confidence in acquiring images, interpreting images, and performing a clinical evaluation using POCUS for all domains except in performing paracentesis. Knowledge scores increased from a baseline of 58% to 83%; p<0.001. At 6 months into the program, 2 hospitalists had uploaded >400 clips each and 7 had uploaded fewer than 20 clips each.

DISCUSSION / REFLECTION / LESSONS LEARNED: I-Scan is a highly rated and effective program to train hospitalists in core POCUS competencies. The 2-day intensive program significantly improves confidence and knowledge. Monitoring of progress and scanning activity was difficult because few hospitalists uploaded clips regularly. Our focus now is on identifying barriers to using POCUS for new trainees. Future analysis will include frequency of scanning, retention of knowledge and skill, and generation of learning curves for each view.

INTEGRATING A NOVEL HIGH-VALUE CARE CURRICULUM FOR INTERNAL MEDICINE RESIDENTS

Rachna Rawal¹; Paul Kunnath²; Fred R. Buckhold²; Jennifer Schmidt³. ¹Saint Louis University, St. Louis, MO; ²Saint Louis University School of Medicine, University City, MO; ³Saint Louis University, Saint Louis, MO. (Control ID #3183505)

NEEDS AND OBJECTIVES: Understand internal medicine resident need for high-value care education Identify components of a high-value care curriculum for internal medicine residents Recognize residents improved self-awareness of high-value care

SETTING AND PARTICIPANTS: The healthcare crisis in the United States is prompting a transformation toward a high-value, cost-conscious culture. Physicians develop their ordering practices early in their training, therefore directing high-value care education at residents will have the greatest impact. A needs assessment demonstrated that only 8% of our residents could provide an adequate free-response explanation of *high-value care*. Only 18% of residents participated in a prior high-value care initiative. This need prompted development of a high-value curriculum.

DESCRIPTION: We designed and implemented a high-value care curriculum directed at Internal Medicine residents. It included six noon didactic sessions, three afternoon school interactive case sessions, and high-value rapid-fire cases during monthly floor orientation. Objectives included defining *high-value care*, applying evidence-based medicine, "how-to" develop a high-value care initiative, cognitive biases, integrating pathology consults, and applying American College of Radiology (ACR) Appropriateness Criteria. Residents completed pre and quarterly post surveys consisting of Likert scale, multiple choice and free responses questions.

EVALUATION: Pre-intervention data showed 85% of residents identified the definition of *high-value care* in a multiple-choice question. 8% and 52% of residents distinguished the definitions of "price" and "cost", respectively. 14% reported familiarity with the ACR criteria and 24% felt comfortable applying those guidelines. After the first didactic session, the number of residents who felt "very comfortable" recognizing hospital overuse increased from 27% to 52% (statistically significant, p<0.05). 96% felt encouraged to participate in a high-value care initiative in the future. Additional data is pending.

DISCUSSION / REFLECTION / LESSONS LEARNED: While the majority of residents could choose the definition of *high-value care* from a

list, they could not generate a free-response definition. This discrepancy highlights that while residents have some basic knowledge of high-value care, they lack the skills to apply and generalize it. Residents were unfamiliar with radiology guidelines.

INTEGRATING SCIENTIFIC RESEARCH INTO MEDICAL EDUCATION THROUGH A COMPREHENSIVE SCIENCE SCHOLARS ELECTIVE COURSE

Yasmin Kamal; Marek Svoboda; Roshini Pinto-Powell. Dartmouth Medical School, Hanover, NH. (Control ID #3185873)

NEEDS AND OBJECTIVES: One of the goals of evidence-based medical education is to familiarize future physicians with the scientific method in order for them to comprehend scholarly literature, and communicate an evidenced based plan of care to their patients. However, many medical students lack the skills necessary to participate in scholarly research. We describe the implementation of a comprehensive elective course designed to equip interested students with these skills through a series of workshops, one-on-one mentorship, and pursuit of a summer research experience. The program aims to provide medical students with the knowledge and skills required to incorporate research into their medical training and contribute to their synthesis and increased use of evidence-based medicine as future physicians.

SETTING AND PARTICIPANTS: Course participants are first-year medical students at the Dartmouth Geisel School of Medicine.

DESCRIPTION: This year-long course consists of four main parts: scientific mentorship meetings, small group workshops, final research project, and a summer research experience. Each M1 student is assigned a mentor - MD-PhD, PhD, or senior MD student, based on their research interests. Mentors help students navigate the research environment at Dartmouth and obtain summer research positions. The instructional portion of the course comprises a series of ten workshops taught by the program coordinators (MD-PhD students) and Dartmouth faculty. At course completion, all participating medical student write a research aims page to effectively communicate the goals of their research project when they apply to local as well as national competitive external research funding opportunities for a first year summer research experience.

EVALUATION: Nine students participated in the first year of the elective (2017-2018). All students secured a research position for the summer following their first year of medical school and four of the nine students obtained nationally competitive funding. 78% of the students indicated that participation in the elective significantly helped them find and secure these positions and 88% said they learned valuable research skills not taught in the medical curriculum.

DISCUSSION / REFLECTION / LESSONS LEARNED: M1 participation in a well-designed research elective has the potential to provide immediate value in the acquisition of a summer research position and to stimulate a lifelong interest in scientific inquiry.

ONLINE RESOURCE URL (OPTIONAL): <https://geiselmed.dartmouth.edu/mdphd-links/science/>

INTEGRATING TRAINEES TO TELEHEALTH INFRASTRUCTURE IN PRIMARY CARE IN THE DEPARTMENT OF VETERANS AFFAIRS

Sarai Ambert-Pompey¹; Leoni Heyworth³; Janeen E. Smith²; Ijeoma Kene-Ewulu⁴. ¹VA, Boise, ID; ²San Francisco VA Health Care System, San Francisco, CA; ³VA, San Diego, CA; ⁴VA, Atlanta, GA. (Control ID #3186353)

NEEDS AND OBJECTIVES: The next generation of healthcare professionals must become competent in delivering clinical services remotely. Nationally, however, little standardized telehealth education exists in training programs. The Department of Veterans Affairs (VA) is working to provide a formalized model of telehealth education for its more than 120,000 trainees. The VA has already delivered over 12 million telehealth encounters and has developed extensive educational materials for its clinicians. Now the VA is using its clinician telehealth curriculum and telehealth best practices to design a telehealth education infrastructure for all healthcare trainees who rotate through primary care in its more than 150 facilities. The intervention to provide national standardized telehealth education for trainees is: 1) Using existing VA Telehealth Training Curricula for clinicians and making it available to all trainees; 2) Developing an inventory of telehealth trained clinicians and pairing them with trainees; 3) Cataloguing best practices in telehealth training at VA facilities; 4) Addressing policy obstacles

SETTING AND PARTICIPANTS: This intervention focuses on the 120,000+ healthcare professional trainees that rotate through over 150 VA healthcare facilities throughout the nation. The development of standardized national telehealth education began with an assessment of the scope of telehealth training and found 69% of all medical centers were providing individualized telehealth training opportunities for trainees.

DESCRIPTION: Graduate, undergraduate and associated health trainees are receiving telehealth didactics, participating in live interactive telehealth simulation sessions, and work-based learning across healthcare facilities and to the patient via mobile devices. Clinicians from different states met once a month via video conferencing technology to discuss different components of the curriculum to adjust to the local resources and time constraint from other competing educational opportunities. The curriculum addresses common and interprofessional components in addition to individual profession-directed components that are within the scope of license.

EVALUATION: Evaluation of the development of a national standardized telehealth education model for trainees will be measured quantitatively and qualitatively. The numbers and expansion of didactic web-based trainings completed by trainees are tracked along with their simulation sessions. Each facility will provide data on the numbers and types of telehealth trainee opportunities they are offering. Telehealth satisfaction surveys for providers and patients will be expanded and accreditation body competencies evaluations.

DISCUSSION / REFLECTION / LESSONS LEARNED: Many of the lessons learned across the different sites were shared and new challenges particularly challenges in common were tackled amongst the group as a whole. We noted there were small things in one site that work well other sites incorporated those like simulations, participation in established team virtual meetings and huddles.

INTERPROFESSIONAL QUALITY IMPROVEMENT PROJECTS: USING QI PRINCIPLES TO DEVELOP A ROBUST QI CURRICULUM

William G. Weppner¹; Rick Tivis²; Sarah Naidoo²; Lisa Inouye¹; Michael F. Krug¹; India C. King³. ¹University of Washington, Boise, ID; ²Boise VA Medical Center, Boise, ID; ³Family Medicine Residency of Idaho, Boise, ID. (Control ID #3184460)

NEEDS AND OBJECTIVES: The goal of this project was to apply QI principles to improve a QI curriculum for interprofessional trainees.

SETTING AND PARTICIPANTS: The Boise VAMC serves as the host to a Center of Excellence in Primary Care Education, as well as multiple graduate health care training programs from internal medicine, psychology, pharmacy

and nursing. Trainees specifically engaged in the QI curriculum include nurse practitioner residents (1st year), nursing students (final year and VALOR students), PGY-2 pharmacy residents (ambulatory care and mental health), psychology trainees (interns and postdoctoral candidates), and internal medicine residents (PGY-2).

DESCRIPTION: The "interprofessional Quality Improvement Projects" (iQIP) curriculum consists of an initial half-day didactic session to introduce QI concepts. This employs a "Zombie Attack" theme with hand-on work for aims statements, pareto charts, process mapping and gamified run charts, among other activities. This is followed by a mentored workplace learning experience for the rest of the year, where trainees rank their interest in a proposed project relevant to the health care system. Each team is composed of at least 3 members, from at least 2 disciplines, with at least 1 faculty mentor. Trainee teams are required to present 2 work in progress presentations, followed by a final presentation at grand rounds for the entire facility.

EVALUATION: The training has been continually evaluated and adapted using an informal PDSA cycle framework by curriculum leads. We employed pre-post evaluation using the Quality Assessment Instrument (QIKAT) (Lawrence et al JGME, Mar 2011, p41-48). This project examines the changes in the program since 2014 and how these changes effected differences in pre-post measures on the QIKAT. In 2014-2015 there was very little change between the pre-post with none of the pre-post change rising the statistical or clinical significance ($P > .18$). This initiated changes emphasizing more targeted learning objectives, and intentional restructuring of the workshop and project components, resulting in significant improvement across the next two academic years in four of the nine measures ($P < .05$). Major modifications were implemented prior to the 2017 academic year to further streamline and focus the process. These changes resulted in significant changes in learning as measured by the QIKAT on five of the nine ($P < .05$) with two others approaching significance ($P = .06$).

DISCUSSION / REFLECTION / LESSONS LEARNED: Curriculum development & implementation is a process, and should be subject to ongoing evaluation with a feedback and improvement mechanism. Cyclic evaluation leads to improvement and assures that the educational intervention remains relevant and related to desired educational goals. Evaluation should not be limited to a single measure of changes in perceived knowledge, but should include measures of the quality of the projects produced.

ONLINE RESOURCE URL (OPTIONAL): <a href="<http://boisevacoe.org>"><http://boisevacoe.org>

IT TAKES A VILLAGE: AN INTERDISCIPLINARY APPROACH TO INTEGRATING WOMEN'S HEALTH INTO RESIDENCY EDUCATION

Janet Henrich¹; Luz S. Vasquez¹; Tracy Rabin²; Jacqueline Satchell¹; Mukta Dhond¹; Susan Maya¹. ¹Yale University, New Haven, CT; ²Yale University School of Medicine, New Haven, CT. (Control ID #3180068)

NEEDS AND OBJECTIVES: In response to identified gaps in residency education in women's health (WH), we developed and implemented a series of ongoing WH education modules. The goals are to: develop an interdisciplinary approach to WH education by partnering with other disciplines and members of the community; introduce topics at the interface of medicine with other fields, or not covered elsewhere in the curriculum; and create a learning environment that fosters the development of a cadre of interdisciplinary WH educators.

SETTING AND PARTICIPANTS: Modules are directed at all 209 residents from the Yale Traditional, Primary Care and Med-Peds Residency Programs and presented according to a rotating schedule in half-day sessions,

8 times a year. PGY1 through PGY4 residents are exposed to all modules over 4 years in protected educational time during ambulatory block rotations. A core group of general medicine faculty are the primary teachers. Partner faculty include community panelists (transgender community leaders) and representatives from Family Planning, Urogynecology, Radiology and Endocrinology.

DESCRIPTION: Four discrete modules supplement the WH content in residents' core ambulatory curriculum and online WH resources. Each module is thematic using interactive teaching methods (practicums/debates/cases/videos/community panels). Residents are assigned key readings before each module. Senior residents serve as debate and discussion leaders. Modules include: *From contraception to menopause: an evidence-based approach to caring for women across the reproductive life span* (menopausal symptoms, contraception options, pelvic and breast exam practicum). *Clinical controversies in women's health: using best evidence to partner with patients around shared clinical decision-making* (breast cancer screening, preconceptual care, abnormal uterine bleeding). *Clinical guideline updates* (osteoporosis and cervical cancer screening and management). *From anatomy to identity* (the difficult pelvic exam and trauma focused care, urinary incontinence, transgender identity).

EVALUATION: Residents complete an anonymous pre and post self-assessment of their mastery of each topic (on a continuous scale of *I know nothing about this subject to I can teach this module*). Mastery increases uniformly from the lower to the upper end of the continuum with varying degree, depending on the topic. The modules are highly rated by residents compared with other education sessions.

DISCUSSION / REFLECTION / LESSONS LEARNED: The WH modules allow us to enhance the education of all residents in areas under their purview but in which they have little mastery. Many areas cross disciplines, and we structured the modules to highlight and model the central role of general medicine faculty in managing these topics with the appropriate use of consultants. Involvement of community members is a powerful way to make residents aware of disparities in care and engage them in advocacy. Residents, faculty and community members are all teachers and learners in this model adding to a growing cadre of WH educators.

JOINING FORCES: A NEW COURSE BRIDGING STUDENTS' PASSION FOR SOCIAL JUSTICE WITH RUSH'S EQUITY MISSION

Ritika Dhawan²; Coralie Pardo²; Paul Kent²; Laura Deon²; David Ansell^{1, 2}; Danesha Lewis²; Elizabeth S. Davis^{1, 2}. ¹Rush University Medical Center, Chicago, IL; ²Rush Medical College, Chicago, IL. (Control ID #3186133)

NEEDS AND OBJECTIVES: We started an elective for first year medical students, the Health Equity and Social Justice Leadership elective, to connect students passionate about social justice to Rush University Medical Center's health equity strategy. Learning objectives: Identify social and structural factors that affect the health of a community. Use data to identify an actionable community or population health problem. Learn how to partner with community organizations. Design an evaluation plan for a community health intervention.

SETTING AND PARTICIPANTS: A Rush Medical College elective for 20 first year medical students.

DESCRIPTION: The Health Equity and Social Justice Leadership elective was started in the 2017/18 academic year. The fall session includes ten sessions covering key domains of social medicine. Teaching methods include site visits, speakers with lived experience, interactive sessions, and key readings. In the spring semester, the students break into groups, each of which partner with a community organization. The groups use community

engagement, data analysis, and quality improvement tools in their work on the projects. Each group is mentored by one of the faculty members. For the 2018/19 academic year, we incorporated feedback from students who took the course the first year. This included expanding site visits and mentoring, adding a course coordinator, and using an application system instead of a lottery for selecting students.

EVALUATION: Students were evaluated using an anonymous survey. Questions reflected learning objectives, clarity of expectations, and feedback on class sessions. For the 2018/19 academic year, we also added a pre-course questionnaire exploring student interests and baseline knowledge. For the first year of the elective, there were 20 slots in the elective. Sixty one students ranked this elective, with 34 students ranking it first on their elective list. For the second year of the elective we required short applications and 40 students applied to the elective. For the 2017/18 academic year, all students who took the course said they would recommend the course to incoming students. We received feedback that the course could be better organized and that there was not sufficient mentoring. Overall, students were positive about the class with comments about how this course was the highlight of their year and was inspiring to them. Of the four projects started during the course, one has become a student led service learning program for all students at Rush. Two others are actively ongoing even though the class ended during the last academic year.

DISCUSSION / REFLECTION / LESSONS LEARNED: Health equity is an interest and priority for medical students. Through this course, we were able to connect students to community leaders in meaningful ways. We learned the value of soliciting feedback from students often and changing the class based on that feedback. Student leadership has been key to this course from its inception. We learned that it was important to have sufficient faculty and course coordinator time to run the course effectively.

LEARNERS WHO STRUGGLE IN MEDICAL EDUCATION: COMMON PRESENTATIONS

Melis G. Celdir¹; Alexander Steeves-Fuentes⁴; Antoinette Schoenthaler³; Paul B. Yellin^{4, 5}; Mack Lipkin². ¹Mayo Clinic, Rochester, MN; ²New York University School of Medicine, New York, NY; ³NYU School of Medicine, New York, NY; ⁴New York University School of Medicine, New York City, NY; ⁵The Yellin Center for Mind, Brain, and Education, New York City, NY. (Control ID #3185900)

NEEDS AND OBJECTIVES: It is common for students to struggle in the challenging academic and social environments of medical education. We posit that some who struggle are not simply the edge of a Gaussian distribution of success but present definable syndromes which are recognizable, testable, and remediable. In this first heuristic look at our hypothesis, we aimed to identify prominent learning profiles and early signs of struggle among medical students with poor academic performance and measurable factors that correlate with their struggles.

SETTING AND PARTICIPANTS: Ninety medical students with academic struggles were referred to a learning assessment center between 2006 and 2018. Reports of the assessment process were constructed to provide remediation strategies for students and educators.

DESCRIPTION: We evaluated reports of the comprehensive neurodevelopmental evaluations. Reports documented referral concerns, students' self-assessments of their competencies, academic history, neuropsychological evaluations and interviews in the assessment process to establish learning profiles of strengths and challenges of each student and recommended remediation strategies. We applied grounded theory methods to identify common patterns in students' comprehensive evaluations.

EVALUATION: Students who displayed signs of struggle earlier in medical school commonly presented after poor performance on standardized assessments (63%, 50/80). They had historically excelled in academic areas rewarding intuitive ways of learning and chosen academic degrees that played to their strengths. In medical school, rote memorization and passive study methods such as transcribing lectures, without active information processing led to inefficient learning, requiring more time for their studies. They lacked strategies to plan their studies and exams, regulate their attention, filter and systematically store information of salient details. Students experienced high rates of anxiety and depression (41%, 37/90) and some received psycho/pharmacotherapy (27%, 24/90). Social isolation and feelings of inadequacy further exacerbated their struggles.

DISCUSSION / REFLECTION / LESSONS LEARNED: Lack of learning and test-taking strategies appropriate for the unique and standardized medical school curriculum, combined with psychosocial stress in a competitive learning environment, expose challenges which may have been unnoticed by students in prior academic pursuits. Their patterns of presentation might alert instructors and students to seek evaluation and assistance early, receive guidance and remediation of specific learning challenges and avoid distressing, diminished academic performance.

LEAVE NO DISCHARGE BEHIND: A TRANSITIONS OF CARE PILOT PROJECT

Neha Jindal; Seagram M. Villagomez. New York University, New York, NY. (Control ID #3183535)

NEEDS AND OBJECTIVES: Transitioning patients safely from the inpatient to the outpatient setting is crucial to patient outcomes and readmission rates, but residents receive little formal training to manage this. Transitions are fraught with issues, including poor communication of discharge instructions and a lack of timely follow-up with the primary care provider (PCP). In addition to the impact on patient outcomes, unsuccessful transitions have been shown to evoke strong negative reactions in student learners. We aim to improve resident education and confidence in managing transitions of care through the implementation of a Transitions of Care (TC) Team at the NY campus of the VA New York Harbor Healthcare System (NYVA NYHHS).

SETTING AND PARTICIPANTS: Our study is taking place at NYVA NYHHS. The TC Team consists of the discharging hospitalist, NYU Internal Medicine residents, and a nurse practitioner. The patients are those who are admitted with a diagnosis of CHF or COPD.

DESCRIPTION: This pilot study sets up a TC Team involving medical residents to provide experiential learning in safe and successful conversion to the outpatient setting. Just prior to the discharge of a patient, an inpatient resident caring for the patient contacts the TC Team to provide a warm hand-off. The patient is then scheduled for a follow-up home visit within 1 week. During the home visit, the patient is examined and assessed by the TC Team, medications are reviewed and follow-up instructions are discussed. Prior to completing the home visit, the TC Team resident contacts the discharging hospitalist who provides precepting and education. The TC team resident then communicates with the patient's PCP.

EVALUATION: We are studying the impact on readmissions and resident confidence in discharge planning and follow-up. The quantitative outcome measure is pre / post intervention thirty-day readmission rates for CHF and COPD. Qualitative outcomes collected through survey data include resident confidence in the discharge process: the ability to provide clear follow-up discharge planning, conduct a post-hospital discharge follow-up visit, perform accurate medication reconciliation, and reduce medical errors after discharge

from the hospital. We are also looking at resident satisfaction with educational experience within the TC Team model.

DISCUSSION / REFLECTION / LESSONS LEARNED: Discharge from the hospital is one of the most complex and vulnerable points in a patient's care. Currently, there is wide variation in resident confidence and guidance during transition to outpatient care. The TC team has created an opportunity for residents to see early outcomes of discharge, particularly how seemingly small details can have great impact on the patient's ability to manage their disease independently. Frequently patients need additional intervention and counseling at the home visit. Residents report satisfaction in care and heightened connection to patients when they see them in the hospital and again in the home setting. Most importantly, they feel this experience strengthens their discharge skills.

LESSONS LEARNED IN CLERKSHIP INNOVATION: A QUALITATIVE STUDY OF THE DESIGN AND IMPLEMENTATION OF LONGITUDINAL INTEGRATED CLERKSHPIS

Michael Chilazi¹; Dana G. Callahan¹; Galina Gheihman¹; David Hirsh²; Mark A. Schuster³. ¹Harvard Medical School, Boston, MA; ²Harvard Medical School, Cambridge, MA; ³Kaiser Permanente School of Medicine, Pasadena, CA. (Control ID #3184593)

NEEDS AND OBJECTIVES: Longitudinal Integrated Clerkships (LICs) offer an opportunity to advance health equity through medical education reform. LIC students participate in the comprehensive care of patients over time, maintain continuing learning relationships with preceptors, and meet clinical competencies across disciplines simultaneously. Compared to traditional block rotations, LICs are more likely to cultivate patient-centeredness, promote work in health advocacy, and address community needs. Despite the growing number of LICs nationally and internationally, the current literature lacks an empirical review of best practices in LIC implementation. Our study aims to fill this gap in order to provide a resource to medical educators and institutional leadership contemplating, implementing, or expanding LICs.

SETTING AND PARTICIPANTS: We interviewed LIC leaders (clerkship directors, discipline directors, administrative coordinators) across the United States, Canada, and the United Kingdom.

DESCRIPTION: Using convenience sampling, we conducted in-depth, semi-structured interviews with leaders of established LIC programs to explore experiences related to designing and implementing LICs.

EVALUATION: We interviewed 29 participants representing 20 LICs. We performed qualitative thematic analysis, which identified 4 key challenges in LIC implementation and possible solutions: (1) Administration: facilitating continuity between learners and patients requires administrative support and technological solutions; (2) Buy-in: outcomes data and shared professional values promote engagement of key stakeholders; (3) Comparability: rigorous program evaluation enables demonstration of comparable or improved outcomes for learners and patients; and (4) Growth: LICs face structural and cognitive barriers to expansion. Our analysis also highlighted that LICs meet key goals for modern undergraduate medical education by: (1) Providing meaningful continuity with patients and providers; (2) Integrating curricula related to community engagement and systems improvement; and (3) Addressing workforce needs of underserved communities.

DISCUSSION / REFLECTION / LESSONS LEARNED: Program leaders experienced similar challenges during the design and implementation of LICs, highlighting future opportunities for research towards shared solutions. Rogers' theory of "Diffusion of Innovation" provides a framework for organizing these challenges and identifying LIC features that promote successful adoption and spread.

LET'S TALK ABOUT THE FUTURE: RESIDENT COMFORT AND EXPERIENCE WITH OUTPATIENT ADVANCE CARE PLANNING

Kaylan Christianer. Columbia University Medical Center, New York, NY. (Control ID #3181317)

NEEDS AND OBJECTIVES: Advance care planning (ACP) allows patients to communicate their goals for future care and appoint surrogate decision makers. Holding these discussions early in the outpatient setting allows for comprehensive planning. Prior studies have identified several barriers in accomplishing outpatient ACP, notably lack of time and provider training. However, in 2016 the Centers for Medicare and Medicaid Services added payment codes to reimburse for ACP conversations, incentivizing their integration into routine primary care. While many residency programs have implemented curricula to improve residents' comfort delivering bad news and discussing goals of care with inpatients, these skills do not necessarily translate to the outpatient setting. This project seeks to assess resident experiences facilitating outpatient ACP which can guide development of future curricula.

SETTING AND PARTICIPANTS: Second- and third-year Internal Medicine residents on a 2-week ambulatory rotation at NewYork-Presbyterian Columbia resident clinic serving a largely Spanish-speaking Medicaid patient population.

DESCRIPTION: Participants were invited to complete a survey assessing their comfort facilitating care planning, as well as their familiarity with common documents. They were also asked to quantify their prior experience facilitating ACP among their outpatient panel, and to identify motivations and barriers to initiating these discussions.

EVALUATION: Preliminary results from 17 participants (100% response rate) reveal residents are significantly more comfortable addressing care planning with inpatients as compared to outpatients (mean 4.2 vs. 2.9 out of 5, p<0.001). Participants had variable comfort with common documents including Out-of-Hospital DNR/DNI (mean 3.9 out of 5), NY State Health Care Proxy (mean 3.4), MOLST/POLST (mean 3.4), and Living Will (mean 2.4). A majority (76%) of residents report discussing ACP with less than 10% of their total outpatient panel, and only 17% of residents report discussing ACP with at least half of their "very old or seriously ill" outpatients. Common barriers identified included lack of time (82%), lack of access to forms (41%), inability to implement (29%), lack of training or experience (24%) and language barriers (24%).

DISCUSSION / REFLECTION / LESSONS LEARNED: This assessment reveals an important discordance in residents' ability to conduct care planning in the outpatient as compared to inpatient setting, as well as low rates of addressing ACP among resident panels.

LIFELONG LEARNING FOR FACULTY: THE CREATION OF A CLINICAL RESEARCH USING SECONDAY DATA COURSE AT AN ACADEMIC CENTER

Halle G. Sobel¹; Abigail Crocker²; Charles D. MacLean²; Benjamin Littenberg². ¹University of Vermont Medical Center, Burlington, VT; ²University of Vermont, Burlington, VT. (Control ID #3181461)

NEEDS AND OBJECTIVES: 1. Deans and department chairs at academic medical centers want to increase academic productivity at their institutions. A faculty development course in designing and implementing clinical research can help achieve this goal. 2. Faculty at academic institutions are surrounded by secondary data through electronic medical records (EMRs) and can benefit by learning how to use this data for scholarly research. 3. Clinicians who better understand and perform clinical research can promote improved quality and

safety at their institution and beyond. EMR data is often under-utilized and learning about such data can promote both scholarly work and improved clinical care.

SETTING AND PARTICIPANTS: Clinical faculty members at The University of Vermont Medical Center were offered an opportunity to enroll in a 10-month faculty development course led by a team of 2 physician researchers, and 3 epidemiologists/ entitled *Introduction to Clinical Research Using Secondary Data*. Participants from Medicine, Surgery, Family Medicine, Pediatrics, Psychiatry, Dermatology, Radiology, Emergency Medicine, Pathology and Hospital medicine completed the course over the first three years, 2015-2018, in three cohorts of 15-19 participants.

DESCRIPTION: The course content focused on an analysis of secondary data rather than primary data collection because of timely data availability and to promote use of data from our EMR. The curriculum included the topics of developing a research question, searching the medical literature, navigating the IRB process, understanding the data extraction process and communicating with data analysts, selected topics in statistics, and how to summarize and present findings in abstract and manuscript format. Each participant was asked to develop a research question and were paired with both a faculty researcher (one of the course teachers) as well as a statistician.

EVALUATION: Each year we completed pre and post student course evaluations. Students rated the experience very positively with 91% noting that the time commitment was "just right" and 100% agreeing or strongly agreeing that they would recommend the course to a colleague. Student confidence in defining a research question increased significantly in a pre-post evaluation with over 84% reporting being "confident or very confident" at the end of the course, an increase of 25% from the baseline ($p < 0.01$).

DISCUSSION / REFLECTION / LESSONS LEARNED: A clinical research course led by experienced faculty for faculty without experience in clinical research is a successful strategy to increase the output of research, QI and patient safety projects at an academic institution. By coordinating institutional resources to be part of a 10-month curriculum, faculty can better learn both the process of clinical research and what resources are available at their institution. The teaching of faculty can help clinicians better understand their practice, be more engaged and better understand how to use secondary EMR data.

LONGITUDINAL ASSESSMENT OF PERSONAL AND PROFESSIONAL DEVELOPMENT COMPETENCIES AT THE PRITZKER SCHOOL OF MEDICINE

Hannah D. Caldwell¹; Christopher Mattson³; James N. Woodruff^{1, 2}; Wei Wei Lee^{1, 2}. ¹University of Chicago Pritzker School of Medicine, Chicago, IL; ²University of Chicago, Chicago, IL; ³University of Chicago Medicine Comer Children's Hospital, Chicago, IL. (Control ID #3175503)

NEEDS AND OBJECTIVES: While the Association of American Medical Colleges named Personal and Professional Development (PPD) a foundational competency for medical students in 2013, few studies have examined how best to teach and assess PPD skills. Our study aims to 1) analyze results of a biannual PPD self-assessment survey administered to the Pritzker School of Medicine Class of 2018 and 2) use results to identify areas for future interventions.

SETTING AND PARTICIPANTS: Following a literature review, we developed the *Personal and Professional Development Skills Assessment Survey* to assess PPD proficiency and attitudes. The optional survey was emailed to the student body every six months, Fall 2014 to Spring 2018. The analyzed cohort were students who matriculated Fall 2014 as well as those joining this cohort following time off.

DESCRIPTION: The 46-item survey consisted of 44 five-point Likert-scale items assessing personal (n=15, i.e. coping skills), professional (n=15, i.e. teamwork), and academic (n=9, i.e. study skills) development, as well as attitudes (n=5, i.e. reflection is important to my personal development) and 2 open-ended questions. (i.e. list three personal development goals). The Likert-scale responses were dichotomized with proficient defined as 4. Descriptive statistics were used to summarize the findings over eight timepoints (S1-S8) and compare preclinical (S1-S4) and clinical (S5-S8) responses.

EVALUATION: A total of 93 students completed at least one survey. Response rates ranged from 38% at S6 (Spring 2017, second half of third year clerkships) to 91% at S2 (Spring 2015, second half of first year). Within each domain (Personal, Professional, Academic), scores were reported as the percentage of total items rated as proficient. The Personal Domain score significantly declined from S2 to S3 (79% to 72%, $p < 0.01$) at the transition from first to second year. The lowest Personal Domain score of 72% occurred at the start of second and third year (S3 and S5) and peaked at 84% at the end of fourth year (S8). The Professional Domain score increased significantly between the start of clerkship year to the half-way point (S5 and S6, 83% to 89%, $p < 0.01$). The Professional Domain score was lowest throughout first year (79%, S1 and S2) and highest throughout fourth year (92%, S7 and S8). The Academic Domain score showed no statistically significant changes between any consecutive time points. When comparing PPD proficiency in preclinical (S1-S4) and clinical (S5-S8) phases, there were significant increases in Professional (79.7% to 86.4%, $p < 0.01$) and Academic (76.1% to 81.4%, $p < 0.01$) Domains. The Personal Domain did not differ significantly (76.3% to 76.0%).

DISCUSSION / REFLECTION / LESSONS LEARNED: Our study used a longitudinal self-assessment to measure students' PPD skill attainment. While we found that personal development skills were lowest during critical transitional periods, these same transition points may offer opportunities for professional and academic growth.

LONGITUDINAL RESIDENT COACHING IN THE AMBULATORY SETTING: A NOVEL INTERVENTION TO IMPROVE CLINICAL SKILLS

Ryan Graddy; Stasia Reynolds; Scott Wright. Jhusom, Baltimore, MD. (Control ID #3180277)

NEEDS AND OBJECTIVES: Direct observation of residents' clinical practice is essential for accurately assessing their skills and to facilitate specific feedback. Opportunities to do this are infrequent, especially in busy outpatient teaching practices. We aimed to assess the effects of a longitudinal direct observation and coaching intervention on residents' clinical performance in an academic GIM practice.

SETTING AND PARTICIPANTS: The Johns Hopkins Bayview GIM Practice is a mixed faculty/resident practice. Although faculty preceptors are encouraged to oversee residents in the presence of their patients, direct observation of complete patient visits is rare.

DESCRIPTION: All 16 interns in a single IM residency class were randomized to the coaching (intervention) or control group at the start of the 2017-18 academic year. Two faculty members with extensive coaching experience performed 3 complete visit observations over the course of internship year for the 8 trainees in the coaching arm. Faculty used a 23 item "yes/no" behavioral checklist, based on tenets of clinical excellence, during the direct observation to focus their surveillance and to facilitate targeted feedback and coaching to residents after each visit. At the end of the academic year, 15/16 interns had a complete patient visit in the practice videotaped. Each video was viewed by 2 senior generalist clinician-educators blinded to the interns'

intervention or control group assignment. These evaluators scored each encounter using the same behavioral checklist and assigned each resident a letter grade (A-F) as an overall evaluation. The proportion of each behavior performed was assessed with Chi-square test and differences in the 2 groups' overall performance of behaviors on the checklist was assessed with student t-test.

EVALUATION: Coached interns completed an average of 21/23 behaviors as graded by expert observers, while uncoached interns completed 18 ($p=0.046$). The average overall grade for coached interns was B+ and for uncoached interns it was B-. While no individual checklist items were performed statistically significantly more often by either group (all $p>0.05$), 11 of the 23 behaviors were more regularly executed among those who had been coached.

DISCUSSION / REFLECTION / LESSONS LEARNED: Episodic longitudinal direct observation and coaching by experienced preceptors was associated with improved clinical performance in real patient encounters among IM interns. Previous work has shown that this type of coaching is both appreciated by learners and useful for identifying blind spots in residents' self-assessment. Longitudinal direct observation and coaching, while time-intensive, is valuable for residents' clinical growth and development.

MAKING THE VOICES OF FEMALE TRAINEES HEARD: YEAR 1 DATA

Lisa Rotenstein¹; Abeba Leveille¹; Rebecca Berman²; Joel T. Katz¹; Maria Yialamas¹. ¹Brigham and Women's Hospital, Boston, MA; ²University of California, San Francisco, San Francisco, CA. (Control ID #3185810)

NEEDS AND OBJECTIVES: While there is increasing awareness of gender-based discrepancies at a faculty level, there is less understanding of how discrepancies apply to trainees. After discovering a potential discrepancy in residency-wide, ad-hoc recognition (via email "shout-outs") of publications for male versus female trainees by program leadership as well as a perceived differential willingness of male trainees to share publishing accomplishments with residency leadership, we developed and implemented a systematic process to identify and publicize resident publications. We analyzed the year 1 data to determine any differences in publication number of female vs. male residents.

SETTING AND PARTICIPANTS: This project was conducted in the Internal Medicine Residency Program at Brigham and Women's Hospital, an academic medical center affiliated with Harvard Medical School.

DESCRIPTION: In January 2018, we adopted a process by which our residency administrative support personnel systematically search for resident publications each month via a structured query of PubMed and our hospital's compilation of lay press articles by affiliates. We also developed an online submission form for residents to notify us of publications. Our program directors then email results to the entire residency monthly.

EVALUATION: We assessed the number of publications identified as authored by male vs. female authors and the distribution of publication type (journal article vs. lay article) by gender in the one year after our program's implementation. We compared this to the gender distribution of publication shout-outs in the six months prior to our program's initiation. Between January and December 2018, there was no difference in the proportion of publications authored by males versus females ($n=86$ (47.3%) by females, $n=96$ (52.7%) by males, $p=0.51$). 10 of 24 (41.7%) lay press articles and 76 of 158 (48.1%) of journal articles were published by female authors; there was no significant difference in article type by gender. In contrast, only 1/6 (16.7%) of email shout-outs in the six months prior to program implementation were for female publications.

DISCUSSION / REFLECTION / LESSONS LEARNED: We demonstrated that systematic search and dissemination of trainee publications can eliminate gender-based disparities in recognition of academic accomplishment. Through the process of implementing this program, we identified that differential self-promotion habits start early in training and are more pronounced in female trainees. The presence of a program leadership committed to advancement of female physicians and willing to engage constructive improvement was key to this program's success.

MASSACHUSETTS GENERAL HOSPITAL WOMEN IN MEDICINE TRAINEE'S COUNCIL: AN INNOVATIVE MODEL FOR FEMALE TRAINEE SUPPORT, ADVOCACY AND PROFESSIONAL DEVELOPMENT

Ana Sofia Warner; Emily Lau; Nneka Ufere; Varsha Tanguturi; Katrina Armstrong; Nancy A. Rigotti; Doreen DeFaria Yeh. Massachusetts General Hospital, Boston, MA. (Control ID #3185708)

NEEDS AND OBJECTIVES: The Massachusetts General Hospital (MGH) is the largest hospital in New England, and is recognized as a pioneer in medical innovation, healthcare delivery, and workforce education and development. There are 386 residents and fellows within the Department of Medicine, 44.8% of whom are female. The MGH supports the professional advancement of women physicians through initiatives including the Office for Women's Careers and dedicated funding for early career female physician researchers. In response to a recognition that similar resources were lacking for trainees, the MGH Women in Medicine Trainee's Council (WIMTC) was developed in 2016 with the goal of supporting the personal and professional development of women trainees at MGH within the Department of Medicine.

SETTING AND PARTICIPANTS: The WIMTC consists of a core group of 30 trainees and 20 faculty advisors. The council is made up of five working groups focused on career development and mentorship, advocacy, recruitment, research and work-life balance. The council meets monthly to discuss goals, progress and future programming.

DESCRIPTION: The council is funded through the Department of Medicine with an annual budget of approximately \$5000. To-date the council has sponsored dinners with notable female physicians, travel grants to fund childcare for trainees travelling to conferences, negotiation and micro-aggressions workshops, mock fellowship interviews, and networking events with faculty. The council has successfully lobbied for improvement in hospital lactation spaces and is working to improve access to childcare services for trainees.

EVALUATION: This coming year the WIMTC plans to begin evaluating our initiatives and workshops to assess the impact that these sessions have on trainees preparedness and to identify areas for improvement.

DISCUSSION / REFLECTION / LESSONS LEARNED: Since its implementation in 2016, the WIMTC has become a sustainable model for female trainee professional development at MGH. The WIMTC has improved female trainees' access to important professional development activities such as networking, negotiations training and mock interviews. Additionally, the council provides a mechanism for fellows and residents to collaborate on initiatives that cross departmental lines. These types of hospital-wide initiatives provide a leadership opportunity for the trainees involved in the council. Perhaps most sustainable is the sense of community that the Council has created among women trainees and involved faculty.

MASTERING CO-MANAGEMENT: A CURRICULUM FOR HOSPITALISTS

Aron Mednick¹; Anne Dembitzer²; Adin Nelson⁴; Shreya P. Trivedi³; Anand Viswanathan¹. ¹NYU Langone Health, New York, NY; ²NYU School of Medicine, New York, NY; ³NYU, New York, NY; ⁴Rutgers New Jersey Medical School, Newark, NJ. (Control ID #3184475)

NEEDS AND OBJECTIVES: The U.S. surgical population is becoming increasingly medically complex, increasing the risk of post-operative complications. Surgeons have traditionally consulted internists and subspecialists for medical management during inpatient admissions, but this has failed to decrease complications or healthcare costs. To address this issue hospitalists have taken on the role of co-managing patients admitted to surgical services. However, internal medicine residencies don't adequately prepare trainees for this role. Safe and effective modern medical care requires training in medical co-management (MCM), yet there exists no robust theory- and evidence-based curricula to teach these competencies. We designed a curriculum to fill this need.

SETTING AND PARTICIPANTS: Thirteen hospitalists with 0-7 years' clinical experience in an academic medical center in New York, NY. Hospitalists spend 50% of their clinical time on an MCM service covering general surgery, vascular surgery, neurosurgery, general neurology/epilepsy, and orthopedic surgery.

DESCRIPTION: We developed a yearlong curriculum based on the Society for Hospital Medicine's guidelines on creating MCM teams and other published frameworks. We applied evidence-based learning theories including: Adult Learning Theory, Cognitivism, Constructivism, and Ericsson's Theory of Expertise. We developed a conceptual framework incorporating key stakeholders in MCM (medical attending, surgical attending, PCP, mid-levels, and patients/families) and 6 core content topics (Roles & Responsibilities, Communication Strategies, Trust & Respect, Common Complications, Transitions of Care, and Deliberate Practice). The curriculum includes two parts: a week-long intensive orientation with Objective Structured Clinical Examinations (OSCEs) and workshops in the main content areas, and a series of monthly continuing professional development (CPD) sessions to facilitate deliberate practice and improve skills needed to manage niche patients on surgical services. These CPD skills are based upon needs identified by the hospitalists and surgical teams.

EVALUATION: Effectiveness will be measured at the program and hospitalist level. The program will be assessed by patient quality metrics (eg, LOS and readmission rates) and satisfaction by the surgical teams yearly. We will evaluate the impact on hospitalists using retrospective pre-post surveys to measure changes in clinical knowledge, confidence and engagement. Assessments will be collected using Qualtrics® survey software.

DISCUSSION / REFLECTION / LESSONS LEARNED: In the early stages of this curriculum, 79% of participants found the CPD sessions "very or extremely helpful." Participants have shown increasing engagement in the curriculum as evidenced by proposals of future session topics and attendance. Data collection is ongoing.

MAXIMIZE THE X+Y: LONGITUDINAL AMBULATORY THREADS

Daniella A. Zipkin; Dinushika Mohottige; Lynsey Michnowicz; Aimee K. Zaas. Duke University, Durham, NC. (Control ID #3185054)

NEEDS AND OBJECTIVES: The Accreditation Committee for Graduate Medical Education requires residency training programs (RTPs) to minimize tension between inpatient and outpatient responsibilities. However, RTPs struggle to balance these arenas while ensuring breadth and depth in internal medicine training. Many programs now use "X+Y" scheduling patterns to balance inpatient and ambulatory time. The Duke Internal Medicine Residency transitioned to a "4+2" schedule in 2016. In the fall of 2017, we collectively engaged residents and faculty across all divisions in a review of the ambulatory education mission. Faculty and residents desired continuity in the ambulatory learning environment in order to achieve learning goals. Residents also requested a formal curriculum bridging clinical experience with didactics. In response, we developed the Ambulatory Threads model described here, allowing residents to experience continuity in the clinic environment in every subspecialty of medicine over the course of two years.

SETTING AND PARTICIPANTS: First and second year Duke internal medicine residents were included in the intervention, which was implemented in July 2018 and leveraged our broad base of faculty in all subspecialties.

DESCRIPTION: The Ambulatory Threads consist of weekly templates made up of grouped clinical sub-specialties such that each template contains 1-2 sessions with each subspecialty, along with continuity clinics, academic half day, and self-care half days. Templates remain consistent across all of the ambulatory blocks in a six-month period, allowing for continuity with sub-specialty faculty throughout that time. Residents migrate to a new thread every six months. Intern threads include "nephrology-rheumatology-endocrinology" and "gastroenterology-infectious diseases", allowing early exposure in these fields which do not have inpatient ward services at Duke. The second year threads are "pulmonary-oncology", and "cardiology-hematology". Through a collaborative effort with education leads in all of the divisions, the academic half day content is matched to the clinical thread. In the academic half day teaching, all faculty are encouraged to utilize innovative educational strategies that optimize interactive, engaging learning techniques while meeting their subspecialty's core educational objectives.

EVALUATION: Of the 162 rotation evaluations sent out between July-October 2018, 122 were completed, for a response rate of 75%. Feedback has been tremendously positive, noting an enriching learning environment enhanced by a strong faculty commitment to teaching. Constructive feedback regarding errors in the complex schedule and geographic locations of clinics have been addressed in revised templates.

DISCUSSION / REFLECTION / LESSONS LEARNED: Beyond simply implementing a 4+2 system with regularly spaced ambulatory time, linking together those ambulatory blocks with longitudinal exposure to multiple subspecialties has substantially improved the ambulatory educational experience at Duke. Faculty and residents have commended the improved learning environment.

MEDICAL STUDENT ATTITUDES TOWARDS INTERDISCIPLINARY INTERACTIONS WITH PHARMACY STUDENTS: A STUDENT-RUN FREE CLINIC PERSPECTIVE

Mark N. Alshak²; Jason Harris²; Alexandra H. Miller²; Pamela Charney¹. ¹Weill Cornell Medical College, New York City, NY; ²Weill Cornell Medicine, New York, NY. (Control ID #3186032)

NEEDS AND OBJECTIVES: The Weill Cornell Community Clinic (WCCC) has recently expanded early interprofessional exposure (IPE) for medical students by integrating pharmacy students and their supervising pharmacists into clinic practice. We decided to explore the impact of this program on the knowledge and attitudes of clinical medical students towards IPE while they rotated in WCCC for six weeks as part of their required Ambulatory Medicine clerkship.

SETTING AND PARTICIPANTS: The Weill Cornell Community Clinic (WCCC) is a medical student developed and run comprehensive primary care clinic that cares for uninsured New Yorkers with Medical, Women and Mental Health clinics. Within the Medicine clinic both clinical and pre-clinical medical students with attending Internal Medicine physicians provide care. Social workers and social work students have been integrated for years. Additionally, nutritionists and a Nurse Practitioner educator have volunteered. More recently a Pharmacy school approached about providing on-site pharmacist evaluations within our medical practice.

DESCRIPTION: Using the pre-validated Student Perceptions of Physician-Pharmacist Interprofessional Clinical Education Instrument (SPICE-R2), surveys were distributed to third year medical students at the beginning and end of their 6-week rotation within the clinic. Attitudes towards interprofessional exposure were assessed on a 1-5 scale (1=strongly disagree, 5= strongly agree). Interprofessional exposure was provided in clinic where pharmacy students worked alongside medical students to provide medication reconciliation and counseling. Pre- and post-intervention data was analyzed using 1-way ANOVA across categories and two-tailed paired t-tests within three categories based on SPICE-R2 designations: interprofessional teamwork and team-based practice, roles/ responsibilities for collaborative practice, and patient outcomes from collaborative practice. Twenty medical students were assessed.

EVALUATION: Overall SPICE-R2 score improved from *4.04 to 4.35 (7.6% increase)* ($p=0.01$). The biggest change in category score was observed in the overall roles and responsibilities section, which increased from *3.27 to 3.91 (19.5% increase)* ($p=0.0001$) with the understanding of the course taken by and training requirements of other health professionals showing the largest area of improvement of any question with an improvement in score of 34% ($p=0.0058$). Overall teamwork scores increased *4.5 to 4.7 (4.7% increase)* ($p=0.0026$). Overall outcome scores did increase, although not significantly ($p=0.62$).

DISCUSSION / REFLECTION / LESSONS LEARNED: Early exposure for medical students to pharmacy students demonstrated improved teamwork and a better understanding of the roles, responsibilities, trainings, and courses required by other professions. Interprofessional exposure in medical school student run free clinics provides an excellent opportunity to foster interprofessional growth and collaboration.

MEETING PATIENTS WHERE THEY ARE: ENHANCING COMPETENCE IN ADDRESSING SOCIAL BARRIERS TO CARE THROUGH A MEDICAL STUDENT PATIENT NAVIGATOR PROGRAM

Priscilla Wang¹; Lorenzo R. Sewanan²; Eamon Duffy³; Matthew Meizlish²; Juliana Berk-Krauss⁴; Sophia Gamez²; Emily L. Coleman²; Pinar Oray-Schrom². ¹Brigham and Women's Hospital, Brookline, MA; ²Yale University, New Haven, CT; ³Johns Hopkins, Baltimore, MD; ⁴Mount Sinai, New York, NY. (Control ID #3186291)

NEEDS AND OBJECTIVES: Research consistently demonstrates that health outcomes are determined largely by what happens outside of the walls of hospitals and clinics. Yet medical student training predominantly

occurs in health care settings and focuses on addressing biological mechanisms of health. To be effective future clinicians, medical students must understand the context in which patients live and make health-related decisions. The objective of this medical student-initiated patient navigator program (PNP) was to utilize a service-learning model to provide medical students with the knowledge, skills and experience needed to help patients overcome social barriers to health.

SETTING AND PARTICIPANTS: Teams in New Haven, CT were formed, each with 2 Yale School of Medicine medical students (1 MS1, 1 MS4+) working with a preceptor (chief resident / attending) supervising multiple teams. In 2016-2017, 8 teams participated; in 2017-2018 the program expanded to 16 teams across 4 sites (2 primary care centers, a diabetes clinic, the Connecticut Mental Health Center).

DESCRIPTION: Recruitment of high-need patients (identified by a care provider) occurs in July and August, with one patient assigned to each team. Teams perform a health / social needs-related intake and form health goals with patients via shared decision making. From September to May, medical student patient navigators (PN) contact patients weekly and help them navigate the health care system and address socioeconomic barriers to health goals, via home visits, attending medical appointments, and other means. This service component is coupled with didactic sessions twice a month teaching means of addressing social determinants of health (e.g. food insecurity, motivational interviewing) and group solicitation of ideas to advance patient care.

EVALUATION: Pre- and post-intervention surveys were conducted assessing knowledge and skills relating to addressing social determinants of health, such as comfort level conducting a home visit and understanding how to obtain transportation to an appointment. Paired analysis demonstrated statistically significant improvement in the majority of areas assessed. PN rated the program very highly and clinicians reported improvements in patient care outcomes (e.g. decreased HgbA1C).

DISCUSSION / REFLECTION / LESSONS LEARNED: Patient navigation is a powerful means of teaching medical students critical skills for addressing social determinants of health. It enables students to regularly apply learning in context, while serving their community and increasing patient contact.

MIND THE GAP: ENHANCING RESIDENT-DELIVERED FORMATIVE FEEDBACK

Malavika Kapuria¹; Shira A. Sachs^{2, 1}. ¹Baylor College of Medicine, Houston, TX; ²Weill Cornell Medicine, New York, NY. (Control ID #3185682)

NEEDS AND OBJECTIVES: Delivering feedback is challenging for clinicians at all levels. Residents face unique barriers to providing feedback given their limited training in this area and their near-peer status to fellow trainees. This has a significant impact on medical students, who rely on feedback from residents to further their professional development. Objectives: (1) Design an intervention to coach residents in providing effective feedback (2) Assess the impact of this intervention on the frequency and quality of resident-delivered feedback

SETTING AND PARTICIPANTS: Over a six-month period, 48 upper-level residents and 96 medical students rotating on Internal Medicine wards at the Michael E. DeBakey VA Hospital were enrolled in the study.

DESCRIPTION: We designed a tool with a four-step model for giving feedback. The steps were as follows: setting (identifying a time and venue for feedback), assessment (soliciting the learner's self-assessment before providing feedback based on direct observation), action plan (assisting the learner in

identifying steps for performance improvement), and summary (making arrangements for follow-up). Residents were randomized to receive one-on-one coaching in using the feedback tool compared to standard preparation.

EVALUATION: Residents in the intervention and control groups completed pre-post surveys assessing self-competence in delivering feedback. Medical students who worked with residents enrolled in the study completed post-surveys assessing the frequency and quality of resident feedback. Trainees who completed assigned surveys, 33 of 48 eligible residents and 35 of 96 eligible medical students, were included in the final data analysis. Regarding the resident surveys, there was no significant difference in the reported frequency of feedback between intervention and control groups. There was a significant difference in self-rated competency setting expectations for feedback, with 83% in the intervention group reporting being "quite competent" or "very competent" in this domain compared to 47% in the control group ($p=0.018$). While there was no statistically significant difference in self-rated competency in providing formative feedback, there was a trend towards improvement with 76% in the intervention group reporting being "quite competent" or "very competent" in this domain compared to 57% in the control group. Regarding the student surveys, there was no significant difference in the reported frequency or quality of feedback between residents in the intervention or control groups.

DISCUSSION / REFLECTION / LESSONS LEARNED: The goal of our intervention was to improve formative feedback provided by residents to medical students. The intervention required a brief orientation session. Residents using the feedback tool reported higher rates of self-competency with regards to setting expectations around feedback, with a trend towards higher rates of self-competency in delivering feedback. Our study was limited by the small sample size of residents, and low survey response rates by medical students.

MINI-GRAND ROUNDS: A CME SERIES FOR BUSY CLINICIANS
Lisa Kearns¹; Sarah Jonaus¹; Cynthia G. Kreger¹; Neeraj H. Taval². ¹Ohio State University, Columbus, OH; ²The Ohio State University Wexner Medical Center, Columbus, OH. (Control ID #3186380)

NEEDS AND OBJECTIVES: As physicians graduate from residency and enter into clinical practice, they are faced with a deluge of new clinical questions. Similarly, those physicians who have been in practice for many years often times find it difficult to remain abreast with new updates or guidelines. While formal education series such as department wide Grand Rounds assist with continuing education, not all sessions are geared toward the busy practicing generalist. Other perceived barriers to continuing education include learning time, infrastructure as many of our physicians practice in different locations, and opportunity. Our objective is to create a sustainable continuing medical education series pertinent to busy clinicians.

SETTING AND PARTICIPANTS: The Ohio State University Wexner Medical Center Division of General Internal Medicine consists of 57 physicians and nurse practitioners who work in seven distinct office locations throughout Franklin County.

DESCRIPTION: The live conference is held at main practice location with Webex conferencing available to all clinic sites. These sessions are held during the lunch hour twice monthly and are approximately 30 minutes during. Each session answers a pertinent clinical question applicable to the practicing general internist. Sessions are delivered by general internal medicine faculty and are peer-reviewed. CME is awarded to those who attend live either in person or via Webex. Sessions are recorded for future viewing for faculty who cannot attend.

EVALUATION: Evaluations are sent to general medicine faculty immediately following each presentation. This provides opportunity for faculty presenters to receive feedback on their teaching. In addition, evaluations are used to track attendance and to receive suggestions for future topics. This is an ongoing project and data are currently being collected.

DISCUSSION / REFLECTION / LESSONS LEARNED: We have had preliminary success with implementing a succinct, general internist-focused CME series for a large group practice scattered at different locations. Not only does this series serve to keep faculty current without sacrificing their busy clinical practices, it also acts as a vehicle for peer-reviewed teaching to help with teaching portfolio development. Preliminary data collection suggest faculty find this series beneficial.

MISTREATMENT BY PATIENTS: A PILOT CURRICULUM BASED ON RESIDENT EXPERIENCES

Sally Namboodiri¹; Timica Campbell²; Carolyn Chan³. ¹Cleveland VAMC, Cleveland Heights, OH; ²Louis Stokes VA Medical Center, Cleveland, OH; ³Metrohealth Medical Center, Cleveland, OH. (Control ID #3138493)

NEEDS AND OBJECTIVES: Mistreatment of physicians by patients is a problem that contributes to burnout. Few educational curricula address this issue for physicians in training. This pilot project sought to characterize resident mistreatment by patients at a Veterans Affairs (VA) and an affiliated university (non-VA) hospital and develop a novel curriculum that provides tools to handle mistreatment.

SETTING AND PARTICIPANTS: One 60-minute session was held as a noon conference for PGY 1-3 internal medicine (IM) residents in two settings: VA and non-VA. VA attendees were $n = 10$ (male = 5, female = 5). Non-VA attendees were $n = 16$ (male = 12, female = 4). Two IM physician educators were facilitators.

DESCRIPTION: Curriculum development was informed by VA residents' experiences with mistreatment. VA residents ($n=20$) were asked about the prevalence, type, perpetrators and effects of mistreatment; based on this data, we developed an interactive, case-based curriculum related to mistreatment by patients with the following learning objectives: 1.Define resident mistreatment 2.Review the prevalence and forms of mistreatment 3.Discuss approaches to mistreatment by patients as a victim and bystander. Cases included unwanted sexual behavior, racial discrimination, and gender harassment. At the VA, large group discussions required residents to demonstrate use of tools from the literature to approach cases. Due to some attendees' reticence to speak out in this format, the non-VA residents were divided into small groups for case studies, which enhanced open discussions. We developed minute papers for pre- and post-sessions; Likert scales were used to determine mistreatment frequency and comfort level with response to mistreatment.

EVALUATION: Mistreatment frequency differed between settings: 70% of VA residents experienced mistreatment frequently or often and 30% experienced it sometimes, while 33% of non-VA residents experienced it sometimes or often and 67% only rarely or never. Pre-session, 70% of VA residents felt uncomfortable or very uncomfortable with their response to mistreatment while only 0-1% of non-VA residents felt uncomfortable or very uncomfortable. Post-session, 90% of residents at both sites felt comfortable or very comfortable handling mistreatment. Residents at both sites were very satisfied with the quality and effectiveness of the presentations. The most helpful aspects were tools reviewed in the session for VA residents and the small group discussions for non-VA residents.

DISCUSSION / REFLECTION / LESSONS LEARNED: Results suggest that IM residents were more likely to experience mistreatment by patients in VA compared to non-VA settings. This could be due to a growing mistrust

of the VA by veterans or the disinhibitory effect of increasingly racist and sexist politics on the largely male veteran population. However, a lack of gender balance in the non-VA group may have led to lower responses. The high satisfaction levels post-session in both settings suggest that the curriculum was beneficial. Limitations included small sample sizes and lack of gender balance.

MODIFIED PROBLEM-BASED LEARNING: AN INNOVATIVE APPROACH TO IMPROVE RESIDENCY EDUCATION, CRITICAL REASONING, AND COLLABORATION

Megan A. McGervey¹; Susan C. Scott¹; Jamal H. Mahar¹; Mohammad G. Mohmand¹; Carlos Isada²; Abby Spencer³. ¹Cleveland Clinic Foundation, Lakewood, OH; ²Cleveland Clinic, Cleveland, OH; ³Cleveland Clinic, Chagrin Falls, OH. (Control ID #3186277)

NEEDS AND OBJECTIVES: Adult learners require different teaching modalities that are not employed in residency programs. Large residency programs rely heavily on large group didactics for the delivery of educational material. However, retention rates following lectures has been shown to be very low. Problem-based learning (PBL) is a student-centered approach where students work in groups to solve a problem using an active and iterative process to identify what students know and, more importantly, what they don't know. While it has used in undergraduate medical education for many years, there are scarce reports of it being used in internal medicine residency programs as a longitudinal and primary curriculum. Our objective was to create a residency curriculum using adult learning theory that engages learners and allows for better knowledge retention.

SETTING AND PARTICIPANTS: This innovation takes place at a large academic medical center that hosts 181 internal medicine residents. All second and third year residents take part in the mPBL sessions that occur during an academic half day within protected learning time during the longitudinal clinic week using the 4+1 block scheduling model.

DESCRIPTION: In this innovative Modified PBL structure, the focus lies on self-directed learning and discussion of discrete learning objectives (LOs) derived from clinical cases in the presence of a multidisciplinary team of experts. Our mPBL consists of two sessions that allow learners to become familiarized with the cases and set discrete learning objectives within small groups. The second session the following day revolves around discussion of LOs with active facilitation to ensure case based learning with input from specialists. The learning is led by residents, while faculty facilitation is centered on more concrete understanding of medical concepts as well as correct interpretation of information and literature. The small group discussions allow learners to make the transition from knowledge gathering to analysis, application and practical utility of knowledge with the ultimate goal of having the learner apply the assimilated knowledge into clinical practice.

EVALUATION: Twenty-nine surveys were collected from second year residents indicating that >75% of participants "agreed" or "strongly agreed" that PBL had supplemented their education. Residents overwhelmingly enjoyed the content expert and the interactive case-based learning approach. Survey comments indicated that knowledge retention increased and that residents were made aware of knowledge gaps during discussion with their peers. Focus groups and survey data are currently being collected for this academic year.

DISCUSSION / REFLECTION / LESSONS LEARNED: Based on survey data, we modified to provide learners with cases well before sessions, adding suggested LOs, choosing high-yield cases spanning different disciplines, using multi-case formats with 4 cases per session, employing discrete learning objectives for the content expert discussion, and increasing the use of handouts and online learning materials.

NARRATIVE ASSESSMENT PROTOCOL (NAP) FOR MEDICAL STUDENTS IN A LONGITUDINAL INTEGRATED CLERKSHIP

Michael McShane^{1, 2}; Britta Thompson¹; Daniel R. Wolpaw¹. ¹Penn State College of Medicine, Hershey, PA; ²Mount Nittany Medical Center, State College, PA. (Control ID #3184883)

NEEDS AND OBJECTIVES: With the goal of achieving standardization and objectivity in assessments, educators have relied on methods that deconstruct observed behaviors into likert scale numbers. These values often fail to offer either meaningful feedback or the promised "objectivity". This has led to increased emphasis on narrative assessments, which in GME have demonstrated to reliably identify learners at risk, and provide authentic feedback. However, it has been challenging to get clinical faculty to do more than complete scales and write short, unhelpful narratives such as "good job" or "read more". Here, we describe our efforts to overcome these barriers through a narrative assessment protocol (NAP) that features faculty semi-scripted narrative prompts, student goal setting, calibration discussions, and faculty supported performance improvement plans.

SETTING AND PARTICIPANTS: Penn State College of Medicine recently launched a four-year curriculum track for 12 students based in State College, Pennsylvania, featuring a longitudinal integrated clerkship (LIC) in the second year. 4 months into this first clerkship iteration, we implemented the NAP.

DESCRIPTION: To construct the semi-scripted narrative prompts, we asked clerkship directors to identify feedback opportunities (FOs) in their disciplines. These discipline specific FOs were combined with two prompts to be completed in reference to the FO: (1) "I really liked the way you..." and (2) "One thing that you could do take your performance to the next level is to..." Faculty were surveyed by email. Next each student filled out 1 FO and compared it to faculty statement. Then students met with the LIC director in a "Calibration Meeting", where this information was reviewed to recalibrate student and faculty observations about clerkship performance, and create an across clerkship goal. In a collaborative meeting, clerkship directors discussed how to best help the student fulfill their goal within each clerkship. To better understand the quality of the NAP, qualitative analysis of faculty narrative statements, student goals and student-specific performance improvement plan was performed.

EVALUATION: Response rate for faculty narrative statements was 77%. Narrative statements were primarily behaviorally based with limited judgmental or non-specific feedback. Initially, student goals were about improving presentation and clinical reasoning. The "Calibration Meeting" helped to improve these goals and the subsequent clerkship director's discussion was characterized by supportive conversation and helpful recommendations.

DISCUSSION / REFLECTION / LESSONS LEARNED: Using a sequence of faculty-identified feedback opportunities, semi-scripted narrative prompts, calibrated SMART goals, and collaborative clerkship director input, we were able to create a meaningful combination of narrative feedback and refined goals for LIC students. We feel that this approach to capturing narrative faculty feedback and supporting student learning and professional growth in the clerkships is promising.

ONE STEP FORWARD AND NO STEPS BACK! NBME SUBJECT EXAM SCORES AND TRANSITION TO AN INTEGRATED CLINICAL CURRICULUM

Laura Zakowski; Kirstin A. Nackers; Raquel Tartar; Eileen Cowan; Katharina Stewart; Sarah E. Ahrens; David Tillman; Laura Jacques; Shobhina G. Chheda. University of Wisconsin School of Medicine and Public Health, Madison, WI. (Control ID #3170282)

NEEDS AND OBJECTIVES: Recent AAMC data shows that two-thirds of medical schools are currently undergoing or planning substantial curriculum changes. During periods of curricular change, it is desirable to track assessment outcomes to inform leadership of possible negative impacts to students during the transition. We used NBME subject exam scores and pass rates to study how moving from a traditional clerkship model to integrated clinical blocks affected student acquisition of medical knowledge.

SETTING AND PARTICIPANTS: The Legacy Curriculum at University of Wisconsin School of Medicine and Public Health followed the standard medical school educational model, including traditional, department-based, clinical clerkships that students entered after 2 years of preclinical basic science curriculum. The school transitioned to the ForWard Curriculum in 2016 and this cohort of students entered new integrated clinical experiences in January 2018 following 18 months of integrated preclinical basic science curriculum. We integrated our Neurology and Psychiatry clinical experiences with Internal Medicine in a new course entitled Acute Care. Family Medicine and Ambulatory Internal Medicine are integrated in Chronic and Preventative Care. OBGYN and Pediatric experiences are integrated in Care Across the Life Cycle. Surgery, Anesthesia, and other procedural specialties are integrated in Surgical and Procedural Care. Finally, we integrated clinically oriented basic science curriculum with the clinical experiences.

DESCRIPTION: We compared NBME subject exam scores and passing rates between the final cohort of Legacy M3 students and first cohort of ForWard students for Adult Ambulatory Medicine, Medicine, Neurology, OBGYN, Pediatrics, Psychiatry, and Surgery. Institutional passing thresholds were not changed.

EVALUATION: NBME scores and passing rates to date for the ForWard Curriculum cohort demonstrate no statistically significant differences from those of the Legacy cohort ($p>0.05$). We do not find substantive negative effects to student acquisition of medical knowledge during the transition period to the integrated curriculum.

DISCUSSION / REFLECTION / LESSONS LEARNED: Medical schools undergoing substantial curricular transformation can be reassured that integration of specialties and reduction of preclinical curricular time does not affect NBME subject exam scores. We will continue to collect data comparing the ForWard and Legacy curriculum students, including NBME Step 1 score comparison, to provide more information about how our integration affects acquisition of medical knowledge.

OPIOID CRISIS: DIVERSIFYING MEDICAL SCHOOL CURRICULA IN RESPONSE TO THE CRIES OF OUR COMMUNITIES

Sandeep Kapoor^{1, 2}; Melissa Paweleczak²; Bruce Goldman^{3, 2}; Laura Harrison¹; Lauren Block^{1, 2}; Joseph Conigliaro^{1, 2}; R. Ellen Pearlman².

¹Northwell Health, New Hyde Park, NY; ²Zucker School of Medicine at Hofstra/Northwell, Hempstead, NY; ³Northwell Health-Zucker Hillside Hospital, Glen Oaks, NY. (Control ID #3185869)

NEEDS AND OBJECTIVES: We are amidst of a large-scale epidemic that impacts our patient population and communities with no sense of discrimination or short-term relief. The misuse and abuse of alcohol, illicit and prescribed opioids, has motivated important dialogue throughout the Nation, our State, our homes, our workplaces, our health system and medical school. Transparently inventorying health professional training, it is apparent that little time is dedicated to develop basic competencies, yielding discomfort, lack of training and experience, manifesting as barriers to addressing substance use.

SETTING AND PARTICIPANTS: The newly designed curriculum was delivered to third year (MS3) students in an allopathic medical school during an inter-clerkship themed week.

DESCRIPTION: We developed and incorporated an 11-hour "opioid epidemic" themed inter-clerkship week, part of a larger 4-year longitudinal "Addressing Substance Use Curriculum", within an allopathic medical school. The themed week included three first-person perspective panel discussions (1. patient in recovery; 2. families dealing with addiction/loss; 3. healthcare professionals in recovery), and six dynamic skills-based workshops (1. opioid overdose prevention/Naloxone rescue; 2. judicious prescribing guidelines; 3. alternatives to pain mgmt; 4. assessment/diagnosis of opioid use disorder; 5. medications for addiction treatment (MAT); 6. landscape of addiction treatment services). To cap off the week, a team-based interactive session was held to encourage learners to formulate better processes using quality improvement science/tools. With over 55 faculty/facilitators representing 25 clinical and non-clinical departments, the interprofessional interdisciplinary approach we were able to execute served to reinforce the reality that the current opioid crisis spans every discipline and aspect of healthcare.

EVALUATION: Learners: pre-/post- (n= 86/82) short-answer quizzes, and qualitative/quantitative surveys consisting of Likert scaled questions and open ended questions to assess knowledge, attitudes, and perceived skills. Quantitative survey data was analyzed using t-tests. Faculty/facilitator: post-session surveys to comment on quality and perceived effectiveness, and overall general feedback.

DISCUSSION / REFLECTION / LESSONS LEARNED: Learner post- 95% Know 2+ options for MAT (Pre: 27%); 95% Know 2+ DSM criteria for Opioid Use Disorder (Pre: 53%); 91% Know 3+ signs of an overdose (Pre: 65%) Learner: "Issues and problems facing the community were raised (opioid crisis) but we weren't left with a cliff hanger, we were brought through the process of diagnosing, recognizing, understanding the patient, and treatment." Faculty: "I was quite impressed and genuinely moved. The quality of the students was outstanding, and their commitment to the greater good was evident in their thoughtful participation. It was obviously a milestone in med school education, and you should be very proud."

OUR "RIGHT TO HEALTH": SELF-GUIDED EXPERIENTIAL LEARNING IMPACTS INTERNAL MEDICINE RESIDENTS ATTITUDES AND BELIEFS ABOUT OF SOCIAL DETERMINANTS OF HEALTH IN AN UNDERSERVED PRIMARY CARE SETTING.

Stacie Schmidt. Emory University, Atlanta, GA. (Control ID #3184907)

NEEDS AND OBJECTIVES: 1. Introduce learners to social determinants of health through experiential activities highlighting disparities in the healthcare experience. 2. Create opportunities for learner self-reflection about their knowledge and attitudes regarding social determinants of health. 3. Inspire learners, in a self-directed manner, to learn about local community resources that address social determinants of health.

SETTING AND PARTICIPANTS: Our Primary Care Center (PCC) is an academic, safety net, hospital-based clinic accommodating 70,000 visits a year to uninsured low-literacy patients. It serves as the main continuity clinic site for more than 130 Internal Medicine residents. Many disparities exist in managing chronic disease among poorer individuals, including decreased access to healthy foods, homelessness, low health literacy, and difficulty navigating large hospital systems. A survey of resident physicians found significant self-identified gaps in preparedness to provide cross-cultural care; education of residents is needed to promote consideration of patients' social and cultural barriers in managing disease and navigating the healthcare system.

DESCRIPTION: We designed an ambulatory experiential module to help Internal Medicine residents at an urban safety-net institution better understand how social constructs hinder the patients' health in the primary care setting.

During their ambulatory month, second-year residents attend an interactive one-hour introductory session on social determinants of health, taught by a faculty member implementing group discussion and social media. Experiential activities are then chosen by learners from a list of options, and carried out in small groups of residents during a half day of protected time. Reflective writing exercises at the end of the experience elicit resident attitudes and lessons learned from their experience.

EVALUATION: 39 second year residents participated in the module. 41% of residents submitted reflective statements about their experience. Reflective responses suggest (1) enhanced appreciation for social determinants of health (2) empowerment to advocate for patient resources (3) appreciation for systems-level factors that impact social determinants of health (4) demonstrated ability to learn about community resources in a self-directed manner.

DISCUSSION / REFLECTION / LESSONS LEARNED: A short, experience-based module can impact resident attitudes about social determinants and improve their advocacy around providing enhanced patient resources. We believe our module to be effective; while a resident response rate of 41% for submitting written reflective statements may seem low at the outset, we believe this to be a high response rate in the context of a busy clinical environment and minimal faculty oversight, thereby demonstrating a high degree of engagement in the module.

ONLINE RESOURCE URL (OPTIONAL): https://doi.org/10.15766/mep_2374-8265.10647

OUTPATIENT HANDOFF MATTERS, TOO! AN INTERVENTION FOR GRADUATING PGY-3 PANEL PATIENTS AND EFFECT ON RESIDENT PERCEPTION IN A SINGLE LARGE ACADEMIC PROGRAM SETTING

Vanessa Scowden, University of Michigan, Brighton, MI. (Control ID #3178376)

NEEDS AND OBJECTIVES: Much attention has been paid to transition of care upon hospital discharge, although outpatient transition of care is an area perceived by many of lesser importance. Graduating residents in primary care settings experience this cycle predictably, and a paucity of evidence exists to help guide programs in best practice. Goals were to establish handoff process and standardize documentation and improve resident satisfaction with close of clinic as well as perception of importance of ambulatory handoff.

SETTING AND PARTICIPANTS: Single continuity clinic site for large academic internal medicine residency.

DESCRIPTION: Graduating PGY-3 resident PCPs and their continuity attending at a single academic continuity site (resident n=5) were selected to review their panels. Patients subjectively identified as "higher risk" were then discussed individually to identify who was best served to undergo intervention- options were to transition to an established resident (rising PGY-2) or an attending panel, or to complete a formal transition of care process. Patients identified for formal transition of care process were identified for in-office return visit prior to resident graduating. This visit note was standardized, designed to remain in the medical record. To evaluate the impact on the residents, an anonymous retrospective pre-then-post survey was completed to assess perception and sense of value for handoff in the ambulatory setting with 100% of surveys returned (n=5). There were four questions designed to evaluate perception of importance for both inpatient and ambulatory handoff, and if the resident felt current curriculum provided adequate instruction for best practice in both settings.

EVALUATION: There were a total of 331 patients identified as having a PGY-3 as PCP and individually reviewed approximately 6 months prior to resident graduation. Of these patients, 39 (11.8%) were determined to be

medically or socially complex enough to be best served by intervention process. Regarding value for inpatient handoff, all PGY-3 agreed or strongly agreed that there is value. They also all agreed or strongly agreed that their current curriculum provides instruction for best practice. This study did not show any change in level of response after our intervention regarding inpatient handoff attitude or provided instruction. All respondents did also agree or strongly agree that there is value in ambulatory handoff, although 4 of the 5 disagreed or strongly disagreed that there was adequate instruction prior to this intervention regarding handoff in the ambulatory setting. After the intervention, 4 of the 5 did improve on ambulatory question metrics, ranging from one to three levels of improvement.

DISCUSSION / REFLECTION / LESSONS LEARNED: This study was created to address a need for improved formal handoff in an ambulatory setting during resident transition. This was formalized in recommendations both for review process, individual patient discussion as well as standardizing documentation.

PC TEACH: DEMONSTRATION OF A NOVEL PEER TEACHING TEAM MODEL IN RESIDENT PRIMARY CARE CLINIC

Katherine L. Chen; Mina Ma; Antonio M. Pessegueiro. UCLA, Los Angeles, CA. (Control ID #3183166)

NEEDS AND OBJECTIVES: Whereas residents regularly teach and mentor each other on the wards, they rarely collaborate with their peers in ambulatory practice. Continuity clinic represents a missed opportunity to use peer teaching to boost primary care skills and attitudes. The PC Teach pilot program aimed to assess the feasibility and impact of a novel outpatient teaching team model.

SETTING AND PARTICIPANTS: 5 residents, 6 interns, and 4 attendings in an internal medicine residency program participated in the pilot.

DESCRIPTION: One resident was paired with one intern in each PC Teach session. In the first 6 months, the resident directly observed the intern's clinic visits and helped the intern prepare for the presentation to the attending. In the second 6 months, the intern saw each patient independently and presented to the resident, who acted as preceptor; the attending supervised the teaching and then confirmed the plan. At the end of each session, participants used worksheets to guide self-assessment and feedback on the intern's clinical skills and the resident's teaching.

EVALUATION: Participants completed anonymous surveys pre- and post-intervention. The study was not powered to demonstrate statistical significance, but several trends were observed. After the intervention, interns and residents reported that they enjoyed working together in PC Teach. Interns also conveyed more positive attitudes toward primary care after PC Teach. Meanwhile, residents reported increased confidence as outpatient teachers and greater interest in pursuing primary care careers. After PC Teach, attendings were less confident in their ability to gauge residents' outpatient teaching abilities and less confident that graduating residents were ready to be outpatient preceptors. All participants agreed that future trainees would benefit from PC Teach. Trainees agreed that the impact on patient care was somewhat positive, and attendings reported that it was neutral.

DISCUSSION / REFLECTION / LESSONS LEARNED: The PC Teach pilot study demonstrated that an outpatient teaching team model was feasible and well received by trainees. Although any of the observed trends could reflect random error, attendings' decreased confidence in residents' outpatient teaching skills might imply that PC Teach gave faculty a novel glimpse of residents' teaching abilities, which previously they had overestimated. More rigorous evaluation of PC Teach will be possible as the program grows. Now in our second year of PC Teach, we have tripled the number of participants

and applied lessons learned from the pilot study, including a more robust orientation, continuity in resident-intern pairings, and improved worksheets for skills-based feedback and reflection.

PERCEPTION VERSUS REALITY IN USE OF TEACH-BACK BEFORE AND AFTER A ONE-HOUR SKILLS TRAINING

Kimberly C. Bates¹; Michelle Ogronick²; Iris Feinberg²; Robert Hendrick²; Kevin Johnson¹. ¹Gwinnett Medical Center, Lawrenceville, GA; ²Georgia State University, Atlanta, GA. (Control ID #3163132)

NEEDS AND OBJECTIVES: Physicians ask patients if they understand their diagnosis or instructions during clinic visits; patients often say yes. However, many patients leave with little idea of their medication and discharge instructions. Teach-Back (TB) is a health-literate technique that allows physicians to confirm patient understanding during clinic visits. The purpose of this pilot study was to evaluate perception vs actual use of TB by medical residents in primary care clinics; if the observed rate of TB was discordant with perception, we examined if a TB skills training intervention had any impact on use of TB. We were also interested in language used during TB and its relationship to patient demographics or health literacy level.

SETTING AND PARTICIPANTS: Participants were Family Medicine and Internal Medicine residents who provide patient care in two clinics in suburban Atlanta, Georgia. Residents were recruited at a regularly scheduled graduate medical education meeting. Residents were told that we would audiotape ten of their patient clinic visits- 5 before and 5 after a skills training intervention. Patients were recruited in waiting areas of the clinics prior to their encounter. Patients were over 18 and spoke English.

DESCRIPTION: Residents completed the "Always Use Teach-Back Confidence and Conviction Scale". Clinic visits were audiotaped and scored for TB. A one-hour TB skills training took place after the first five audiotaped visits. A second round of visits were audiotaped after the training. Content analysis was performed on TB language. Demographics and health literacy level were collected on patients.

EVALUATION: n/a

DISCUSSION / REFLECTION / LESSONS LEARNED: Despite high level of perception of TB (60%), TB was only used 2.5% of the time. Post-intervention, TB use increased to 53%. Findings may be critical to improving physician communication: a single one-hour intervention dramatically increased use of TB from 2 to 41 instances. Residents used more patient-centered and collaborative TB language after the training intervention. There is a range of how residents perform TB with no relationship to patient demographics or health literacy level.

PERFORMANCE AND CONFIDENCE OF MEDICAL RESIDENTS IN LEADING A RAPID RESPONSE TEAM: A QUALITY IMPROVEMENT PROJECT

Maythawee Bintvihok¹; Esilida Sula Karreci¹; Bertrand Jaber¹; Andrew Moraco². ¹St.Elizabeth's Medical Center, Brighton, MA; ²St. Elizabeth's Medical Center, Brighton, MA. (Control ID #3186993)

NEEDS AND OBJECTIVES: A rapid response team (RRT) is a team of providers that is summoned to the bedside to immediately assess and treat a patient demonstrating signs of imminent clinical deterioration, with the goal of preventing intensive care unit transfer, cardiac arrest, or death. RRT activation is associated with reduced in-hospital cardiopulmonary arrest and mortality. We reviewed the total number of RRTs activated at SEMC in 2016 and established a rate of 15.6 per 1,000 admissions, lower than rates of 20-40

reported in published literature. Prior studies have shown that RRT training can improve team confidence and ability.

SETTING AND PARTICIPANTS: We conducted a survey of 54 medical residents (63% response rate) to examine the level of comfort with activating and leading a RRT. Amongst PGY-1 residents, 6% had previously activated a RRT, only 12.5% felt comfortable leading a RRT, 81% never had formal RRT practice, and 25% were reluctant to call a RRT due to concerns with ineptitude. Amongst PGY-2 residents, 58% had ever activated a RRT, 66% felt comfortable leading a RRT, 25% never had formal practice, and 60% felt the need for orientation on how to lead a RRT. The survey results demonstrated that the concerns with ineptitude amongst residents in conducting a RRT were secondary to lack of training in common urgent scenarios. The goal of this quality improvement project was to improve resident performance and confidence in leading a RRT through education and training.

DESCRIPTION: We provided a series of 9 didactic sessions, conducted mainly by a staff neurologist, a cardiology fellow, and a pulmonary and critical care fellow (in March and May 2018). Each session included simulation-based training in common urgent scenarios that lead to RRT activation. We also provided a pocket information card with a brief algorithm for each scenario and a pocket sized list of hospital phone extensions to aid in reaching certain services during a rapid response.

EVALUATION: To assess the impact of our intervention, we conducted a post-implementation resident survey. Amongst PGY-1 residents, 93% had activated a RRT, which improved from 6% in the pre-intervention period. 64% felt comfortable leading a RRT, which significantly improved from 12.5% in the pre-intervention period ($P = 0.001$). Amongst PGY-2 residents, 78% reported activating a RRT, which improved from 58%. 100% felt more comfortable leading a RRT, an improvement from 66% in the pre-intervention period but did not reach statistical significance ($P = 0.157$). The RRT activation rate increased from 15.6 to 16.7 per 1,000 admissions following our intervention.

DISCUSSION / REFLECTION / LESSONS LEARNED: Formal instruction on RRT through didactic sessions and simulation-based training can potentially improve knowledge and confidence of medical residents in leading RRTs. This can lead to increased awareness of RRT activation to prevent intensive care unit transfer, cardiac arrest, and death. Future efforts will focus on coordinating with the Code Committee to implement mock RRT scenarios.

PGY-1 TO PGY-2 TRANSITION: LEADING RAPID RESPONSES

Emily Cetrone¹; Hallie Rozansky¹; Marina Zambrotta¹; Subha Ramani²; Matt Difrancesco¹; Tomas Cordova¹. ¹Brigham and Women's Hospital, Brookline, MA; ²Brigham and Women's Hospital, Harvard Medical School, Boston, MA. (Control ID #3178333)

NEEDS AND OBJECTIVES: When PGY-1 residents transition to PGY-2 year, they function as supervisors of junior trainees, teachers, and team leaders with scant training in these skills. One of their most challenging roles is leading management of clinically unstable patients in "rapid response" scenarios ("rapids"). In our new curriculum, PGY-1s will run simulated rapids and receive feedback on their performance. The curriculum will also help program leadership identify gaps for further training. Our curricular objectives are that residents will: 1) Demonstrate increased confidence in running rapids 2) Exhibit awareness of the roles of the various participating staff 3) Gain knowledge of criteria that trigger rapids 4) Be open to receiving feedback on performance 5) Demonstrate effective leadership and communication skills

SETTING AND PARTICIPANTS: In 2018, residents in the Scholars in Medical Education pathway implemented the first "Intern to Junior Transition Retreat" at our institution. The retreat included a didactic session on running

rapids and codes. Resident evaluation of the retreat indicated that further training in rapid responses was needed, and over one-third of respondents requested hands-on simulation training. The new curriculum will take place toward the end of intern year at our simulation center; each intern will have the opportunity to lead a simulated rapid, followed by feedback and debriefing.

DESCRIPTION: - Pre-simulation: Didactic teaching on clinical parameters for calling a rapid and the personnel who arrive. Emphasis will be placed on leadership and communication skills. - Simulation: Each intern will lead one scenario and participate in one scenario as a nurse. Both scenarios will use the same chief complaint with two different underlying causes and clinical trajectories. - Post-simulation: We will conclude with a debriefing guided by checklists outlining key leadership skills.

EVALUATION: Program evaluation will include: 1) A questionnaire to assess residents' self-reported confidence in running rapids before, immediately after and six months after simulation training. Results will be compared to data from the 2018 Transition Curriculum, where interns received didactic teaching only. 2) Achievement of specific leadership and communication endpoints during each scenario. This information will guide debriefing and identify areas for future curricular revisions. 3) Audio-recording of debriefing sessions and thematic analysis to identify areas for future training.

DISCUSSION / REFLECTION / LESSONS LEARNED: The planning team learned the following key lessons: needs assessment is key to successful planning of educational content and strategies and curriculum implementation; scholarly approach to curriculum design is important; and getting buy-in from key stakeholders, such as chief residents and the program director, is critical to success.

POLICY AND ADVOCACY FOR CLINICIANS: TEACHING SYSTEMS THINKING TO INTERNAL MEDICINE RESIDENTS

Jennifer B. Cowart¹; Michael Maniaci²; Jaimie Grega²; Michele D. Lewis². ¹Mayo Clinic, Jacksonville, FL; ²Mayo Clinic in Florida, Jacksonville, FL. (Control ID #3153766)

NEEDS AND OBJECTIVES: 1. Increase practical knowledge of the US healthcare system and the impact of healthcare policy on the daily work of internists. 2. Improve awareness of and comfort with physician advocacy. 3. Provide education in the ACGME Core Competency of Systems-Based Practice.

SETTING AND PARTICIPANTS: Year-long, monthly morning report series for residents in an academic internal medicine program.

DESCRIPTION: We created a curriculum in healthcare policy and physician advocacy for internal medicine residents, delivered in half-hour lectures during morning report. The course began in the 2018-2019 academic year. A pre-course survey was administered to all internal medicine residents in our program prior to the first lecture, and a post-course survey will be administered in June 2019.

EVALUATION: The pre-course survey identified gaps in self-reported knowledge of the healthcare system: low levels of ability to describe process of federal healthcare policy making, staying up to date on current healthcare policy news, familiarity with US healthcare payers, or comfort contacting elected officials about issues. Residents agreed that advocacy was important to the work of physicians, but most reported having never participated in an advocacy effort. Most residents agreed that voting was important and 90% reported having voted before.

DISCUSSION / REFLECTION / LESSONS LEARNED: Discussion: With current events showing continued changes in healthcare delivery and medical education, we identified a growing need for physicians to enter the policy and advocacy space. This course was designed to address gaps in

knowledge and awareness in these domains. Pre-course survey data confirmed these information gaps, while showing that residents agree that advocacy is an important part of their role as physicians. The curriculum is being administered currently as a series of monthly lectures, and will also include encouraging residents to participate in physician advocacy activities at the state or federal level with internal medicine professional societies, including "Hill Day". This type of curriculum can be implemented in a variety of settings, not exclusive to internal medicine or to postgraduate medical education. Reflections/Lessons learned: During the first year of curriculum development, a traditional lecture model is being used. The time constraints of the 30-minute morning report model limit the time for meaningful discussion around the topics, which are often new to the learners. Future iterations may employ other modalities, to potentially include a "flipped classroom". Written or video materials could be delivered to the learners in advance, so that lecture time may be spent discussing and interacting with the content. This material shares some commonality with patient safety and quality improvement, in terms of the systems-based practice focus, and some policy material could be incorporated into a quality-focused morbidity and mortality conference or into other lectures on purely clinical topics.

PREPARING FUTURE PHYSICIANS TO CARE FOR PATIENTS WITH OPIOID USE DISORDER - BUPRENORPHINE WAIVER TRAINING COURSE DURING MEDICAL SCHOOL

Irvin Lien¹; Jody S. Chou⁴; Diane L. Levine²; Eva Waineo³. ¹Wayne State University School of Medicine, Detroit, MI; ²Wayne State University, Detroit, MI; ³Wayne State University school of medicine, Detroit, MI; ⁴Wayne State University, Okemos, MI. (Control ID #3184545)

NEEDS AND OBJECTIVES: The opioid epidemic in the US has become a major issue in healthcare and is destructive to individuals, families, and communities. Despite the decrease in opioid prescriptions, an unintended consequence is increased use of illicit or dangerous opioids such as heroin and fentanyl. In 2017, there was an estimated 72,306 drug overdose related deaths and the Emergency Departments (ED) nationally saw a 30% increase in opioid related overdoses. Innovative programs can help ensure patients are offered optimal treatment options. Most primary care physicians self-report they lack the skills to identify and appropriately treat substance abuse disorders (SUDs). Studies have suggested that the best solution is to improve medical school curricula, which translates to better educated future physicians. Unfortunately, most curricula do not provide adequate education to identify and treat SUDs in the medical practice. Buprenorphine is a partial μ -receptor agonist that is utilized to treat opioid addiction. To prescribe buprenorphine, an 8-hour Medication Assisted Treatment (MAT) training must be completed. Only 808 of the 28,206 active physicians (<3%) in the state of Michigan are registered to prescribe buprenorphine. We developed an innovative approach to provide students with the skills to understand how to prescribe buprenorphine and build confidence to medically manage opioid use disorders in the future. By completing the training and obtaining their permanent license, students will have completed all requirements to prescribe buprenorphine as a physician.

SETTING AND PARTICIPANTS: Third year medical students on their internal medicine clerkship are offered the MAT training during their 8-week rotation.

DESCRIPTION: The MAT training is offered online by the American Osteopathic Academy of Addiction Medicine twice a month and is free of charge. Training consists of a 4.25-hr webinar and 3.75-hr online module. Students who complete the training can choose to take one day off their clerkship. A pre- and post-experience survey is completed to assess how the training has impacted perspectives on patients with SUDs.

EVALUATION: Preliminary data suggests medical students do feel there is a lack of SUDs education in the curricula. However students have a strong interest in learning how to prescribe and utilize buprenorphine in their medical practice. After completing the training, medical students report that they have a better foundation on when buprenorphine can be prescribed and how to recognize SUDs.

DISCUSSION / REFLECTION / LESSONS LEARNED: Medical students recognize opioid use disorders is an important issue within communities and want to help their future patients. This training has importance to all students regardless of their interested specialty. Offering the MAT training can supplement the school's curricula and is generalizable to use by other medical schools.

PRIMARY CARE BEHAVIORAL HEALTH INTEGRATION: USE OF A PSYCHOLOGIST IN RESIDENT DIRECT OBSERVATION

Lisa N. Kransdorf; Stephanie R. Young; Jessica M. Bernacki; Colin L. Robinson; Mina Ma; Alice Kuo. UCLA, Los Angeles, CA. (Control ID #3184754)

NEEDS AND OBJECTIVES: Structured direct observation is an important component of resident training to ensure achievement of core competencies. For residents who will eventually practice in primary care, mastering these core competencies as they pertain to behavioral health is especially important. Recognizing this need, a growing number of residency programs are incorporating integrated behavioral health clinicians (IBHCs) in clinical training sites. A study of residents in training programs by Hemmings et al. that currently incorporate IBHCs reported an increase in interpersonal communication skills awareness and a positive impact on patient care. We are not aware of existing literature, however, regarding the use of IBHCs in the direct evaluation of residents. As noted in a study of family medicine residents (Martin et al.), though trainees may understand the concepts behind behavioral health competencies, they may not have insight into their own knowledge and skill deficits without direct instructor feedback. IBHCs bring a unique perspective in the assessment of residents in behavioral health-related core competencies. At our institution, we will be using IBHCs in the assessment of residents in structured direct observation. We plan to compare resident core competencies in behavioral health in trainees who experience structured direct observation by both IBHCs and medical attendings compared to trainees exposed to direct observation by only medical attendings.

SETTING AND PARTICIPANTS: The study setting is a large academic medical center in a densely populated urban area. The study population will be Internal Medicine residents and Combined Internal Medicine-Pediatrics residents at UCLA. Location of the study will be their continuity clinic site. The behavioral health integration at these sites will be provided by doctoral level psychologists (PsyD and PhD).

DESCRIPTION: This will be a cross-sectional study of Internal Medicine residents in the UCLA-Olive View Primary Care track and Combined Internal Medicine-Pediatrics residents (IHBC + medical attending direct observation) compared to categorical UCLA Internal Medicine residents (medical attending-only direct observation).

EVALUATION: UCLA has a structured direct resident observation program with a templated evaluation form assessing specific core competencies for each resident. We will compare core competency scores with specific attention to interpersonal communication, professionalism and management of mood disorders between study groups over a 12-month academic year.

DISCUSSION / REFLECTION / LESSONS LEARNED: We hypothesize that the feedback provided by IBHCs in the structured direct observation of residents will result in improved core competencies with regard to

behavioral health. This specific area of core competencies is of special importance as the behavioral health care in our country becomes increasingly fragmented; our primary-care oriented graduates will need to be especially effective and engaged behavioral health advocates for their patients.

PRIMARY CARE PROFESSIONS PERCEPTIONS: A CURRICULUM TO CORRECT STEREOTYPES AND CLARIFY TEAM ROLES AMONG TRAINEES OF MULTIPLE HEALTH PROFESSIONS

Anna Golob^{1, 2}; Linda Pyke⁴; Mary-Catherine J. Kane³; Cassandra Song⁵; Diane Smith⁴; Joyce E. Wipf⁶. ¹VA Puget Sound Healthcare System, Seattle, WA; ²University of Washington, Seattle, WA; ³VA Puget Sound, Seattle, WA; ⁴Seattle VA Puget Sound Health Care System, Seattle, WA; ⁵VA Puget Sound Health Care System, Seattle, WA; ⁶VA Puget Sound, University of Washington, Edmonds, WA. (Control ID #3185610)

NEEDS AND OBJECTIVES: The Seattle VA Center of Excellence in Primary Care Education (CoEPCE) aims to transform primary care education out of professional silos and train physicians and other health professionals to be highly competent in providing team-based collaborative care. Even with shared CoE educational and clinical training experiences, we find our trainees may still have limited knowledge and misperceptions about skills and roles of their colleagues. Here we describe our curriculum, adapted from Case Western Reserve University's "Interprofessional Exercise," aimed at exploring biases and enhancing understanding of other professions' roles and expertise.

SETTING AND PARTICIPANTS: Our "Professions Perceptions" seminars are held in primary care once yearly when all participating CoE trainees ($n=35$ /year) are >3 months into their respective graduate training program. We include all CoE trainees and faculty based in primary care, including internal medicine MDs, nursing (NPs and RNs), psychology, pharmacy, social work, and psychiatry.

DESCRIPTION: In the seminars, trainees and faculty gather in a conference room with several large posters on the wall. Each poster has the name of one profession with two questions: 1) What are three things you think of when you hear this profession name? and 2) What are this profession's skills and roles on the primary care team? Trainees visit each profession's poster and write their perceptions. Next, trainees and faculty of each profession gather by their profession's poster and review/reflect on the perceptions recorded. Each profession then shares with the large group whether they feel perceptions and roles of their profession were accurately captured; corrects misperceptions; and reviews their team roles.

EVALUATION: We tracked perceptions poster data for the past two academic years and recorded faculty observations. For some professions, there was near consensus on descriptors: for example, social workers as "magicians" and RNs as "heroes." For other professions, there was a broad range of descriptors and more role confusion; for example, differences and commonalities between MD and NP primary care providers; and psychologists and psychiatrists. Our faculty observe that over time, trainees have increasing sophistication of understanding and appreciation of their interprofessional colleagues.

DISCUSSION / REFLECTION / LESSONS LEARNED: This curriculum provides a safe, intentional environment for trainees to share their perceptions and confirm or correct perceptions by others. Lessons learned include: 1) timing is crucial to maximize trainee participation and comfort: previous sessions held at orientation were less successful given trainees were still learning about their own professional roles and were less comfortable discussing biases; 2) this seminar builds on CoE trainees' shared training experience to better inform perceptions, and shows increasing knowledge of

others' expertise and roles; 3) misperceptions remain, particularly for professions with "overlapping roles" versus unique contributions.

PRIMARY CARE QUALITY IMPROVEMENT TEACHING FOR INTERNAL MEDICINE RESIDENTS TO IMPROVE CARE GAPS

kristin huang; Daniel Chandler; Deborah Blazey-Martin; Stacy Schwartz; Julie Tishler. Tufts Medical Center, Newton, MA. (Control ID #3185119)

NEEDS AND OBJECTIVES: Multiple care gaps between resident and attending patients exist in our academic primary care practice, including in colon cancer screening and HTN control. We sought to use quality improvement (QI) teaching and practice as one tool to decrease these disparities and improve health outcomes for residents' primary care patients. A systematic review of the literature has shown a paucity of data regarding effectiveness of residents' participation in QI efforts, particularly concerning patient outcomes (Patow *et al*). We sought to design an intervention that would improve both resident education around basic QI concepts and clinical outcomes. We hypothesized that this intervention would improve residents' familiarity with their patient panel as well as their comfort level with QI skills. We also hypothesized that this intervention would improve the residents' rates of colon cancer screening and HTN control.

SETTING AND PARTICIPANTS: Our internal medicine residency program includes 74 residents, all of whom have continuity clinic at a single academic primary care practice on the main teaching hospital campus. Residents' average panel size is 96 patients.

DESCRIPTION: Over the semester, junior and senior residents had one 3-week primary care rotation during which they participated in a 2-hour QI workshop and received individualized data on their panels regarding colon cancer screening and HTN control. They designed aim statements and plan-do-study-act (PDSA) cycles, and then implemented their PDSA cycles during their rotation. They were surveyed before and after this rotation regarding their attitudes and knowledge about QI.

EVALUATION: On a 5-point Likert scale, residents' comfort level with managing their panel rose from 3.85 (n=55) before the QI training to 3.92 (n=39) after it. Residents' comfort level with crafting an aim statement rose from 3.51 to 4.26; their comfort with designing and implementing a PDSA cycle rose from 2.80 to 3.92. Residents' interest in making QI a part of their career also rose from 3.35 to 3.56. Only 62% of residents had performed an intervention based on their panel report in the past, and this rose to 85%. 62% of residents knew the rate of HTN and colon cancer screening in their patient panels before the training, and this rose to 97% after. Only 45% of residents had performed a PDSA cycle prior to the QI training, and this rose to 77% after. Residents' baseline rate of colon cancer screening in January 2018 was 34%, which rose to 43% by July 2018. Residents' baseline HTN control rate was 65% in January 2018, and this stayed constant through July 2018.

DISCUSSION / REFLECTION / LESSONS LEARNED: A quality improvement workshop followed by implementation of individual, self-designed PDSA cycles focused on colon cancer screening and HTN control improved both residents' comfort with QI skills and colon cancer screening rates among resident patients.

PRIMER COURSE DURING RESIDENCY FOR IN-FLIGHT MEDICAL EMERGENCIES (PRIME): A SINGLE-CENTER RANDOMIZED CONTROLLED TRIAL

Yazan Daaboul; D. Alexander Morrison; Anupama Kumar; Joseph Rencic; Laura K. Snydman. Tufts Medical Center, Boston, MA. (Control ID #3176018)

NEEDS AND OBJECTIVES: Management of in-flight medical emergency remains absent from medical curricula among residents and is an unmet need. The PRIME study will be the first randomized controlled trial that will test the hypothesis that a multidisciplinary primer course, including video series and role playing, for in-flight emergencies will improve the fund of theoretical knowledge and confidence level among first-year residents when managing in-flight medical emergencies.

SETTING AND PARTICIPANTS: First-year resident physicians at Tufts Medical Center in Boston, MA are eligible to participate.

DESCRIPTION: First-year residents will be randomly assigned to receive either 1) an educational primer course including video series and role playing for in-flight medical emergencies [intervention arm] or 2) no educational material [control arm]. The videos and role playing content will include the approach to commonly encountered emergencies, as well as aviation physiology, medico-legal considerations, familiarity of medical kits, triaging techniques, and documentation. The course will not include pediatric or obstetric emergencies.

EVALUATION: The primary endpoint of the trial is pre-specified and is defined as the mean difference in the score of the MCQ test between the intervention vs. control arm. The 20-question multiple choice question (MCQ) assessment will evaluate subjects' fund of knowledge regarding relevant clinical pearls. In addition, a retrospective pre/post survey will evaluate learners' attitudes and comfort pre-exposure to the course (all subjects) vs. their comfort post-exposure (only intervention arm).

DISCUSSION / REFLECTION / LESSONS LEARNED: The results of this trial will be available April, 2019 by the time of presentation at SGIM. The required sample size is N=24, which was estimated based on the two-means Student's t-test to provide a mean difference of 20% in the primary outcome. The intervention of video series and role playing, as opposed to traditional teaching, was chosen to allow replicating the course elsewhere and minimize the effect of confounding, such as teacher techniques. If the differences between the study groups are statistically significant, this trial will be the first to provide a scientifically reliable, standardized means to help physicians address commonly encountered in-flight medical emergencies.

PROSPECTIVE VALIDATION OF HIV-ASSIST, AN ONLINE EDUCATIONAL TOOL FOR HIV TREATMENT DECISION SUPPORT

Nicky J. Mehtani¹; Manoj V. Maddali²; Jonathan Z. Li³; Maunank Shah.

¹Johns Hopkins University School of Medicine, Baltimore, MD; ²University of California San Francisco, San Francisco, CA; ³Brigham & Women's Hospital, Boston, MA. (Control ID #3177776)

NEEDS AND OBJECTIVES: The transformation of HIV into a chronic disease has increased demand for providers proficient in HIV management, yet the supply of such providers is declining. This is in part due to a perpetually evolving landscape of HIV with continual changes in clinical guidelines and an expanding repertoire of antiretroviral (ARV) drugs. Guidelines advocate for an individualized approach to ARV selection, but synthesizing the various factors pertinent to optimal regimen selection is complex and time-consuming. There is critical need for innovations that promote increased involvement of primary care physicians in HIV care and integrate efficient learning of HIV management principles into clinical practice.

SETTING AND PARTICIPANTS: Multi-criteria design analysis was used to construct HIV-ASSIST—a free, online interactive tool to inform clinical decision-making for ARV selection. Development included construction of a multi-attribute utility function drawing upon existing literature, guidelines, expert opinion, and focus groups to refine algorithms. A prospective survey of experienced HIV providers from Johns Hopkins, Brigham & Women's,

Massachusetts General Hospital, and UCSF was conducted to evaluate concordance of HIV-ASSIST with expert prescribing practices.

DESCRIPTION: An initial literature review identified 11 key attributes pertinent to ARV selection, including viral load, mutations, tropism, HLA-B5701 status, CD4 count, comorbidities, comedications, treatment history, and factors related to adherence. The HIV-ASSIST online interface allows user input of these attributes, across which the algorithm measures and ranks all potential ARV regimens, which are presented to users, along with dosing guidelines, drug interactions, clinical trial data, and an explanation of all decision-making steps to provide tailored educational support while simultaneously improving clinical care.

EVALUATION: Ten patient case scenarios of varying degrees of complexity were distributed to 15 HIV clinicians across multiple institutions, who were asked to recommend a specific ARV regimen for each case. Among 4 cases of ARV-naïve patients with and without comedications and comorbidities there was 100% concordance between provider free responses and the top 5 HIV-ASSIST ranked outputs when guideline-contradictory responses were excluded; among 3 cases of virally-suppressed ARV-experienced patients there was 93% concordance; and among 3 cases of viremic ARV-experienced patients there was 84% concordance. Concordance was under 93% for only two cases, and for each the 15 providers suggested 9 discrete ARV regimens—demonstrating heterogeneity in clinical practice.

DISCUSSION / REFLECTION / LESSONS LEARNED: HIV-ASSIST demonstrated a high degree of concordance with ARV selection by experienced HIV providers. Despite substantial variation in provider prescribing practices for ARV-experienced patients, the results suggest that HIV-ASSIST is a robust resource to aid clinical decision-making and educational support in primary care settings.

QUALITATIVE ASSESSMENT OF PRIMARY CARE EDUCATION IN AN INTERPROFESSIONAL TEAM: THEMES FROM THE IMPROVING PATIENT ACCESS, CARE, AND COST THROUGH TRAINING (IMPACCT) EXPERIENCE

Don-Andre Jackson¹; Lyndonna M. Marrast²; Alice Fornari¹. ¹Northwell Health, Great Neck, NY; ²Zucker School of Medicine at Hofstra/Northwell, Kew Gardens, NY. (Control ID #3178273)

NEEDS AND OBJECTIVES: This IP clinical training program requires integration of skills contributed by learners from across various disciplines: psychology, medicine, pharmacy and physicians assistant (PA). Now in the third year since its inception, we sought to identify the elements of this IP team that make the huddle and precepting experience effective. We anticipate this data will help design faculty development training material to improve IP participation of learners and faculty.

SETTING AND PARTICIPANTS: This is a qualitative study employing semi-structured interviews with 14 IP healthcare team members(4 pharmacists, 9 medicine attendings, 1 psychologist) to elicit experiences of conducting huddles, precepting in an interprofessional team, and educating learners of various disciplines in this model of care. Themes were identified using an iterative content analysis approach of the interviews, post transcription.

DESCRIPTION: Northwell Health has a federally funded grant from HRSA to develop and implement a longitudinal clinical program entitled Improving Patient Access, Care, and Cost through Training (IMPACCT). The goal is to provide interprofessional(IP) trainees with a mentored primary

care experience integrating education and clinical skills focused on patient-centered care, quality improvement and population health in an IP team-based clinical setting. Teams interact via patient interactions, precepting and huddles. Huddles are prepared pre-visit discussions to assess the unique needs of every patient prior to each clinical session.

EVALUATION: As our population ages and medical comorbidities become more complex, there is an increasing need for IP collaborative approach to patient centered care. This analysis has demonstrated several important themes:(1) Huddles as effective tools organize patient care in an IP setting, (2) Precepting in this model of care increases interprofessional communication and camaraderie. Further interviews from all IP team members are needed to develop these initial themes into faculty development content. We plan to use this as part of our continuous quality improvement effort for IMPACCT clinic.

DISCUSSION / REFLECTION / LESSONS LEARNED: Eight interviews were conducted with the IP attendings who precept the IP trainees. Participants described huddles as being resident driven, prone to tangents, more effective with defined leadership. Most important is that successful huddle leaders can be team members other than physicians. Additionally, participation of pharmacy and PA learners improved when they were assigned specific tasks. Study participants reported that this model of care had unique challenges and rewards when precepting. Common themes about the precepting experience were (1) increased need to balance work flow and efficiency while educating multiple learners, (2) deeper connections with other professionals, and (3) increased reliance on other IP clinicians on the team.

RED EYE ROUNDS: KNOWLEDGE IN THE CLOAK OF DARKNESS

Kimberly Indovina^{1, 2}; Chi Zheng^{1, 2}; Noelle Northcutt^{1, 2}; Anna M. Munoa^{1, 2}. ¹Denver Health, Denver, CO; ²University of Colorado School of Medicine, Denver, CO. (Control ID #3185975)

NEEDS AND OBJECTIVES: At our hospital, there has historically been little interaction between residents and hospitalists during the night shift. Residents reported inadequate communication with hospitalists overnight about patient flow and triage, and identified lack of faculty-led overnight education as a programmatic weakness. In designing Red Eye Rounds (RER), our goals were 1) to increase nighttime communication between residents and hospitalists, and 2) to add structured teaching to nighttime workflow using a high-yield, sustainable curriculum.

SETTING AND PARTICIPANTS: Hospitalists and internal medicine residents working night shifts at an urban academic safety-net hospital.

DESCRIPTION: RER is a meeting of night shift hospitalists and residents that occurs every night at midnight and lasts about 15 minutes. It provides a structured framework to troubleshoot patient care or flow issues and to discuss a clinical pearl. To help our faculty facilitate RER with minimal preparation, we created a curriculum of teaching resources consisting of: 1) high-yield board review questions using MKSAP and other resources, 2) brief summaries of key practice-changing articles, and 3) a guide to clinical reasoning for common cross-cover calls. We spent 6 months developing RER prior to its launch. We first surveyed residents to understand their preferences for nighttime teaching, then developed the RER curriculum, then piloted RER and made small changes based on initial feedback. We officially integrated RER into overnight workflow in fall 2017.

EVALUATION: To evaluate the impact of RER, we gather monthly attendance data and participant feedback. Tracking attendance has increased accountability and promoted RER as standard practice. While in the first

month RER occurred only 48% of nights, frequency of attendance has increased steadily, and has consistently been above our goal of 90% since month 7. Participant feedback has been overwhelmingly positive. Hospitalists commented, "It's a really good thing. It's changing the dynamic between us and the residents literally overnight!" and, "There is more of a sense that the residents should feel free to call us anytime they have questions or concerns." The chief resident noted, "The residents have really enjoyed the opportunity to ask faculty clinical questions and discuss admission flow. It's been the most successful project implemented this year."

DISCUSSION / REFLECTION / LESSONS LEARNED: We've found that RER improves resident-attending nighttime communication and encourages frequent dialogue, increases hospitalist awareness of unstable patients and logistic problems, facilitates high-yield learning, and boosts overall night shift satisfaction for both residents and hospitalists. We are now partnering with colleagues at our affiliated teaching sites (university and VA hospitals) to expand RER and standardize the curriculum across sites. Our framework could easily be adapted to other programs, and we hope that structured nighttime communication and education will become a national standard among internal medicine residencies.

RESIDENT INITIATIVE FOR AN ULTRASOUND CURRICULUM
Raymond Lam; Artin Galoosian; Ingeborg Schafhalter-Zoppoth; Iris Ma.
 California Pacific Medical Center, San Francisco, CA. (Control ID #3184673)

NEEDS AND OBJECTIVES: Internal medicine (IM) physicians are increasingly using point of care ultrasound (POCUS) to aid in bedside diagnostics. However, ultrasound education in IM residency programs is lacking. Only 25% of surveyed IM residency programs offer formal ultrasound training. We evaluate a resident-driven ultrasound curriculum to address this educational need.

SETTING AND PARTICIPANTS: IM residents and medical students at the California Pacific Medical Center participated in the ultrasound curriculum between October 2017 and May 2018. Two Sonosite X-Porte and two handheld GE Healthcare V-Scan ultrasound machines were used in the study. Motivated residents volunteered to develop workshops under the guidance of fellows and attending physicians with expertise in bedside ultrasound. These residents led weekly one-hour ultrasound rounds consisting of brief didactics followed by hands-on mentored scanning of inpatient volunteers. The curriculum included core topics in cardiac, pulmonary, hepatobiliary, venous, and renal ultrasound.

DESCRIPTION: Baseline knowledge of trainees was assessed anonymously through a written evaluation administered before and after each session. Each evaluation included the basics of ultrasound physics, scanning technique, and interpretation of clinically relevant ultrasound images. Residents were anonymously evaluated on a 10-point confidence scale at the start and end of the program. Qualitative feedback was also solicited. Our primary outcome was the change in performance in the written evaluation score assessing ultrasound knowledge, and a secondary outcome was the change in resident confidence level.

EVALUATION: A total of 56 residents and 9 medical students completed the ultrasound knowledge assessment. Their average score increased from 55.2% (standard deviation [SD] 27.4) before teaching to 83.6% (SD 18.5) after the teaching, with a significant increase of 28.5% ($p < 0.001$, paired t-test). There were 69 residents who completed the confidence assessment. Their average confidence score increased from 2.6 (SD 1.7) at the beginning of the year to 4.2 (SD 2.2) at the end of the year, with an increase in average confidence levels by 16% ($p < 0.001$, two-sample t test). The qualitative

feedback included a desire to keep attendance optional and to maintain the hands-on format of scanning patient volunteers. Trainees also expressed a desire to facilitate attendance by creating protected time for the ultrasound sessions.

DISCUSSION / REFLECTION / LESSONS LEARNED: A resident-driven ultrasound initiative was an effective educational model in IM residency as shown by a significant improvement in knowledge scores and confidence ratings globally across all training levels. Future directions for this program include integration with inpatient medicine rounds or morning report, studying the effect of POCUS on patient satisfaction, and testing residents for diagnostic accuracy.

RESIDENT REPRESENTATION ON HOSPITAL COMMITTEES: A MODEL FOR ADVOCACY, QUALITY IMPROVEMENT AND PROFESSIONAL GROWTH

Nathan C. Nowalk¹; June Kampangkaew¹; Diana Stewart²; Erica Lescinskas¹; Charlie Lan¹. ¹Baylor College of Medicine, Houston, TX;

²Baylor College of Medicine/Michael E. DeBakey VA Medical Center, Houston, TX. (Control ID #3186257)

NEEDS AND OBJECTIVES: Needs: Resident representation on hospital and institutional committees allows residents to learn how the leaders of their institution approach systems-based issues and implement change. We have developed a framework within our institution to increase resident representation at hospital committees to facilitate resident advocacy, involvement in quality improvement, and resident empowerment. Objectives: To provide residents opportunities to participate in quality improvement initiatives through committees To develop a sustainable model for meaningful resident participation on committees

SETTING AND PARTICIPANTS: Hospital committees were selected from four hospitals in the Texas Medical Center. Participants included all 2nd year residents from Baylor College of Medicine's Internal Medicine Residency ($n = 51$).

DESCRIPTION: There is a universal expectation for physicians to serve on institutional committees after their training. However, no similar expectation exists for the resident in training. Only recently did the Clinical Learning Environment Review (CLER) suggest training programs involve residents in committee participation to integrate trainees into quality improvement. When hospital committees involve residents, there is a mutual benefit between hospital leadership and the trainee. Thus, we aimed to develop a sustainable framework for ensuring residents have the opportunity to serve on hospital committees in an impactful way. Seventeen committees were identified among the VA, county hospital, private hospital and large oncology center. A group of 3 to 4 PGY-2 residents were assigned to one hospital committee with a committee administrator as a point of contact. Examples of some of these committees include: Code Blue committee, Quality Review, Infection Prevention, Pharmacy and Therapeutics and Antibiotic Stewardship. A monthly electronic survey was used to confirm attendance, receive feedback from residents, and demonstrate meaningful impact.

EVALUATION: Early qualitative data suggests our initiative is succeeding in involving residents in hospital processes. A Patient Flow Committee member has reported that the residents have been "very helpful in providing valuable insight into the process map for admissions from the emergency room." Other residents have standardized code blue notes while serving on the CPR committee. We continue to collect monthly surveys to monitor compliance, resident contributions, and obstacles encountered while serving on these committees.

DISCUSSION / REFLECTION / LESSONS LEARNED: We recognized an untapped potential in having residents participate on hospital committees. At a teaching hospital, residents offer a unique perspective as they intersect with multiple disciplines and work at the front line of patient care. Thus, for a hospital initiative to achieve the fullest success, the buy-in of the resident stakeholder is paramount. For the resident, committees offer an opportunity to practice leadership, network with specialists in their desired field, and contribute to hospital projects.

RESIDENT RESPONSE TO A SPECIALTY CLINIC SESSION FOR PATIENTS WITH CHRONIC PAIN ON OPIOIDS

Serena L. Roth¹; Laila Khalid¹; Aaron Burkenroad³; Joanna L. Starrels².

¹Montefiore Medical Center, Bronx, NY; ²Albert Einstein College of Medicine & Montefiore Medical Center, Bronx, NY; ³University of California, Los Angeles, CA. (Control ID #3184404)

NEEDS AND OBJECTIVES: Internal medicine (IM) residents have low confidence and satisfaction treating patients with chronic pain on chronic opioid therapy (COT). To address the dual aims of training residents about judicious opioid prescribing and providing guideline-adherent patient care, we developed a weekly resident teaching practice session for patients on COT, the Power Over Pain (POP) Clinic. We report on resident survey responses after completion of the 2-year curriculum.

SETTING AND PARTICIPANTS: POP Clinic is a weekly session at a large urban IM teaching practice in Bronx, NY that cares for 150 patients on COT. IM residents rotate through POP Clinic 8 times during their PGY2&3 years.

DESCRIPTION: Since 9/2016, all patients on COT must be seen in POP Clinic at least yearly. Residents in POP Clinic see 1-3 patients per session in hour-long visits precepted by two IM attendings with expertise in chronic pain and opioids. Residents receive 30-minute didactic lectures before each session on topics including opioid safety and efficacy, multimodal pain care, opioid use disorder, and interpreting urine drug tests. Precepting focuses on summarizing the risks and benefits of opioid therapy, optimizing medications and non-pharmacologic treatments, counseling patients, and naloxone provision.

EVALUATION: Residents completed an online survey prior to their first POP session during PGY2 (baseline) and at the end of PGY3 (post-POP). The survey assessed confidence and reward in managing patients on COT and experiences in the POP Clinic on a 5-point Likert scale from "strongly disagree" to "strongly agree." Paired t-tests were used to compare confidence and reward in the baseline and post-POP periods. Of 23 residents who received the full POP curriculum between 2016-2018, 21 (91%) completed both surveys and were included in the analysis. In the post-POP survey, residents agreed that POP Clinic improved their confidence in managing patients with chronic pain, their ability to perform comprehensive pain assessments and identify opioid use disorder, and their confidence in prescribing nonopioid pain medication (median response 4 for all items). Resident confidence in prescribing opioids significantly decreased from baseline (mean 3.8) to post-POP (mean 2.7, p<0.001). There was no significant difference in resident enjoyment in managing patients with chronic pain from baseline (mean 2.6) to post-POP (mean 2.3, p=0.23).

DISCUSSION / REFLECTION / LESSONS LEARNED: IM residents reported positive impact of POP Clinic on their confidence managing chronic pain and COT. However, confidence in opioid prescribing decreased and reward in managing patients with chronic pain was unchanged. The lack of improvement in confidence in opioid prescribing may reflect increased awareness of the challenges and risks associated with prescribing opioids

and may suggest a need to revise the curriculum. Even with improved skills, it is challenging to increase resident enjoyment of managing patients with chronic pain.

RESIDENT-LED EHR TRAINING IN AN ACADEMIC AMBULATORY CLINIC

Elizabeth Tran¹; Jacob Murray¹; Bernadette Miller²; Carmen Vesbianu²; Kristin Rodriguez². ¹The University of Oklahoma, Tulsa, OK; ²University of Oklahoma School of Community Medicine, Tulsa, OK. (Control ID #3178579)

NEEDS AND OBJECTIVES: Despite the widespread use of electronic health records (EHR), medical trainees continue to struggle with effectively navigating these systems. Evidence shows that the usual classroom training is insufficient for new EHR users, yet we found no studies that have evaluated or disseminated the effectiveness of alternative training methods. Consequently, we developed a comprehensive, "hands-on" training course for the incoming PGY1 residents with the aim of improving the competency and efficiency of their use with our EHR system.

SETTING AND PARTICIPANTS: Participants included all PGY1 Internal Medicine residents (n=12). The training sessions were led by PGY2 and PGY3 residents (n=18). Two faculty members administered pre- and post-EHR skill assessments independent from the training sessions.

DESCRIPTION: Each year, incoming interns participate in a 4-hour classroom EHR training taught by the on-campus EHR specialist during their orientation week. For this project, we administered an assessment to evaluate the interns' understanding and utilization of basic functions of Centricity EHR after the conventional training was completed. From these results, we identified common problem areas and deficiencies that required correction. We designed a comprehensive resident-led training that included placing orders, e-prescribing medications, reviewing labs and test results, etc. The training was delivered during the first week of +1 ambulatory block and consisted of a one-hour noon session from Monday to Thursday for a total of four sessions. The interns completed a post-assessment at the conclusion of the training.

EVALUATION: Twelve PGY-1 residents were evaluated using a 13-item workflow skills assessment tool. The assessment required the intern to demonstrate each function/skill in real-time with each skill graded based on the ability to complete tasks independently, with assistance, or needing additional training. Before the training, 27.9% of interns were able to perform basic EHR tasks independently. After the training, 90.5% of participants achieved competency. The overall difference between pre- and post-tests was statistically significant (p<.001).

DISCUSSION / REFLECTION / LESSONS LEARNED: While EHR systems are becoming a necessity in all clinics, training, specifically for residents, remains subpar. We demonstrated that conventional EHR training is insufficient and that resident-based training has a significant impact on the effective utilization of EHR in every day clinical situations.

RESIDENT-LED REVIEW SESSION FOR THE INTERNAL MEDICINE CORE CLERKSHIP

Shradha A. Kulkarni, Baylor College of Medicine, Houston, TX. (Control ID #3187019)

NEEDS AND OBJECTIVES: Every year, over 20,000 students matriculate to medical schools in the United States. Every one of these students are required to complete the core clerkships including Internal Medicine (IM).

The National Board of Medical Examiners (NBME) subject examinations remain a staple of undergraduate medical education (UME) core clerkships in North America due to their established standardized and objective assessment of medical knowledge. While there are widely accepted review materials such as NBME self-assessments, question banks, and Step up to Medicine and the Board Review Series texts, no standardized oral shelf exam reviews are recognized among medical students. At Baylor College of Medicine, feedback from students on the IM clerkship revealed a need for improved review content for the NBME exam. The following innovation was developed to address this need.

SETTING AND PARTICIPANTS: This innovation involved medical students on the IM clerkship at Baylor College of Medicine, and took place as an after-hours, voluntary session on campus.

DESCRIPTION: A voluntary, resident-led review was held during the middle of each IM clerkship for an 18-month period. The review was 2 hours in duration, led by a senior IM resident, and structured as a content-based PowerPoint (with intermittent audience participation questions) covering all major organ systems. Additionally, tools and strategies for studying were provided to the students.

EVALUATION: Anonymous surveys were distributed before and after the session to examine the effect on the students' perceived level of preparedness. The surveys consisted of qualitative questions with a 5-point Likert scale (with 5 being the most positive).

DISCUSSION / REFLECTION / LESSONS LEARNED: Six review sessions were held and over 80% of clerkship students attended the sessions. Results showed a statistically significant increase (using a t-test) in perceived knowledge of the content and structure of the exam (2.6 to 4.0), confidence studying for the exam (3.7 to 4.2), and overall preparedness for the exam (3.2 to 3.5). The overall rating for the session had a mean of 4.8. This innovation increased medical student confidence and perceived preparedness for the NBME IM exam. The high attendance rate and positive reviews likely indicate effectiveness and potential for continued success. Given the standardized content and structure of the NBME exam, this shelf review session is likely applicable to any clerkship at any medical school that administers the NBME exam.

RESIDENTS AS TEACHERS IN MEDICAL STUDENT CLINICAL SKILLS COURSE EFFECTS ON BEDSIDE TEACHING

Hector H. Gonzalez¹; Lisa C. Martinez². ¹FAU Charles E. Schmidt College of Medicine, Delray Beach, FL; ²Florida Atlantic University, Boca Raton, FL. (Control ID #3184633)

NEEDS AND OBJECTIVES: There has been a decrease in bedside teaching in both undergraduate and graduate medical education. Our objective was to implement a clinical skills curriculum where internal medicine residents served as teachers for first year medical students. We wish to explore the influence of faculty development in residents as teachers by analyzing bedside teaching following participation in clinical skills course sessions.

SETTING AND PARTICIPANTS: We implemented the curriculum during first semester clinical skills course at our medical school's simulation center. The study population consisted of 10 PGY-2 or PGY-3 residents randomly selected based on their clinic schedules. Sixty residents who did not participate in the teaching sessions were used as controls during the survey. The course consisted of bedside clinical skills teaching with first year students incorporating history taking, and whole organ system physical examination.

DESCRIPTION: Residents were assigned afternoon teaching sessions at the simulation center, participating on average in 3-4 sessions. On assigned days

residents attended faculty development at 12:15 focusing on properly performing clinical skills and effectively teach them. Teaching followed this from 1:20-4pm with medical students. This course focused on teaching communication, physical exam techniques, professionalism, and clinical reasoning. Residents observed students, providing verbal coaching and feedback. To assure resident teaching was equivalent to using faculty, residents were assessed by student evaluation of residents and end of course OSCE of students.

EVALUATION: An anonymous survey link was sent via email to all residents for completion. This study was approved by the institutional IRB. The survey evaluated resident's previous teaching experience, interest in teaching and personal comfort with bedside teaching. Residents participating were asked about their perceived improvement in clinical skills teaching and comfort with bedside education following completion of the course.

DISCUSSION / REFLECTION / LESSONS LEARNED: This study sought to be more than just an adaptation to local needs. An important lesson was the important correlation between the symbiotic benefit of medical student and resident teaching. We sought to determine whether involvement in first year medical student clinical skills teaching increases resident comfort in teaching at bedside. We have created a formalized curriculum where the needs of satisfying course objectives can be accomplished by our residents, while providing the courage to lead their clinical teams at bedside.

RESTRUCTURING AMBULATORY CURRICULUM

Jasmine Omar; Danielle L. Heidemann; Alexis C. Hafika. Henry Ford Health System, Detroit, MI. (Control ID #3186315)

NEEDS AND OBJECTIVES: During the 2017-2018 academic year, the curriculum for ambulatory medicine consisted mainly of discussion of clinical trials from scholarly journals. Results of both the mid-year and end of the year survey administered to residents showed dissatisfaction with the educational session, due to emphasis on clinical trials and lack of discussion regarding medical management of common outpatient pathology. This prompted restructuring of the curriculum with the goal of improving resident satisfaction, providing more management guidelines, and better preparing residents for board exams.

SETTING AND PARTICIPANTS: Ambulatory education in our institution takes place prior to our residents' traditional half-day continuity clinic. Small groups of up to 10 residents and 4 faculty participate in a "flipped classroom" format.

DESCRIPTION: In the 2018-2019 academic year, our ambulatory curriculum underwent several key changes. First, educational sessions were shifted to focus more on guidelines and medical management of outpatient conditions. Second, each month a subspecialty topic was assigned that paralleled our inpatient educational noon conference. In this format, the outpatient curriculum built on concepts and topics addressed in our inpatient curriculum. Third, we utilized our in-training results to help optimize topic selection to help residents focus on areas where scores tend to be lower. At the end of each month we had a resident-lead board review session to review key points and answer questions as a group.

EVALUATION: Mid -year surveys identical to the previous academic year were used to assess the resident and preceptor response to changes in the curriculum. 77% of residents rated the curriculum as good or excellent, a 30% increase from the year prior. 23% of residents rated it as fair/poor, a 30% decrease from the year prior. When asked about board review content, 56% of residents felt there were enough board review questions, a 38% increase from the year prior. Preceptors also felt their residents were more engaged during the sessions then they had been previously. Direct resident feedback has been

positive, including comments that they appreciate the synchrony of the inpatient and outpatient curriculum.

DISCUSSION / REFLECTION / LESSONS LEARNED: Resident satisfaction with the ambulatory curriculum has improved with the recent curriculum changes, leading to increased engagement in our educational sessions. Residents prefer broad discussions about clinic management rather than discussing clinical trials. By organizing these discussions to supplement the inpatient curriculum, residents felt they had a more structured educational experience. Board review questions help to reinforce the monthly topic while simultaneously preparing the residents for the ABIM. Choosing topics that are relevant and enjoyable to the targeted learners help enrich the ambulatory educational experience through increased participation and learning opportunities.

RETHINKING THE MEDICINE SUB-INTERNSHIP: TARGETING CRITICAL SKILLS THROUGH ACTIVE LEARNING AND MENTORSHIP

Alice Tang¹; Sydney Katz²; Stephanie J. Tang³. ¹Weill Cornell Medical College, New York, NY; ²Weill Cornell, Brooklyn, NY; ³Weill Cornell Medicine | NewYork-Presbyterian Hospital, Long Island City, NY. (Control ID #3184749)

NEEDS AND OBJECTIVES: While sub-internship rotations are typically viewed as a capstone experience prior to internship, most lack a formal curriculum. Students are often expected to become competent in essential clinical skills by passively observing others; however, clinical teachers are varied in their skills and observation may not be the most effective means for learning these skills. Furthermore, students often do not receive sufficient observation-based formative feedback. To address these needs, we created a new sub-internship rotation with key objectives to: (1) Hone essential clinical skills and entrustable professional activities (EPAs) through interactive workshops, (2) Stimulate weekly self-reflection, feedback, and goal-setting, and (3) Provide frequent high quality feedback on core clinical skills.

SETTING AND PARTICIPANTS: Fifteen fourth year medical students completed a novel medicine sub-internship rotation at an affiliate hospital of a major urban academic medical center between July 2017 and September 2018.

DESCRIPTION: Our four-week sub-internship rotation was designed to foster students' mastery of the EPAs through integrating direct faculty observation, collaborative feedback, and a clinical skills-based "Foundations" curriculum. High quality real-time feedback was facilitated by the team structure of one attending, one PA, and one sub-intern. Self-reflection, feedback, and goal-setting were facilitated by weekly meetings with faculty reviewing a collaborative feedback form. Clinical skills were developed through interactive workshops that targeted essential skills necessary for residency.

EVALUATION: All students completed an anonymous course evaluation comprised of free response and Likert-type items. Mean confidence in starting internship improved significantly after completing the rotation (from 2.2 to 4.3 on a 5-point scale). Students rated autonomy, coaching and mentorship, observation and feedback, and culturally sensitive care highly (mean ratings ranging 4.9 to 5 on a 5-point scale).

DISCUSSION / REFLECTION / LESSONS LEARNED: Our innovative sub-internship rotation highlights the benefits of direct observation and mentorship, collaborative feedback, and a skills-based curriculum. Our rotation demonstrates the value of a 1:1 attending to learner ratio. Future directions include expanding the curriculum and the collaborative feedback form across all other medicine sub-internships sites. Our preliminary data is limited

by the small sample size. We acknowledge the challenges in maintaining quality assurance as we expand this rotation to other sites. We recognize how crucial faculty development will be to ensure students receive the same high-quality coaching and mentorship across sites.

RISKY BUSINESS: ON THE ROAD TO ELIMINATION OF HCV THROUGH IMPROVED RISK ASSESSMENT

Dawn Fishbein²; Shari Sawney²; Stephen Fernandez²; Emily Paku²; Sara Miller¹. ¹Med-IQ, Baltimore, MD; ²MedStar Health Research Institute, Washington, DC. (Control ID #3185129)

NEEDS AND OBJECTIVES: Hepatitis C virus infection (HCV) represents a major public health threat that continues to grow, largely due to the increased use of injection drugs. A focus on patients at high risk for HCV is a critical part of the public health effort to identify, cure, and eliminate this disease. The rise in HCV rates demonstrates a continued need for risk-based testing and requires a more informed and educated clinician compared to birth cohort testing. This educational initiative was employed to improve risk-based HCV testing and linkage to care.

SETTING AND PARTICIPANTS: We implemented an iterative and multifaceted HCV quality improvement initiative beginning in February 2018 that included multiple educational opportunities and continuous sharing of data regarding clinical practice patterns. This initiative included clinicians in 8 primary care and/or women's health clinics across the MedStar Health, a large regional healthcare system in Maryland and Washington, DC.

DESCRIPTION: Education was delivered live in-person, online, and through short evidence-based text publications distributed on a bi-monthly basis. Data evaluating baseline practice and changes included survey evaluation of perceptions, attitudes, and barriers and quantitative assessment of practice patterns from March 2018 through the intervention period as documented in the EHR. Changes in practice patterns before and after the intervention were compared with a chi-squared test; a Z test was used to calculate the odds ratio across groups.

EVALUATION: In the baseline provider survey, 64.2% of clinicians (n=53) ranked their ability to identify candidates for HCV testing based on risk as a 3 or 4 on a 4-point Likert scale (4 = highest); 58.5% ranked their ability to elicit an accurate social history to evaluate behavioral risks as a 3 or 4. Among clinicians who had been in the same location for 3 or more years (n=42), 28.6% reported increased use of injection drugs among their patients. EHR data demonstrate low levels of risk evaluations as well as HCV testing for those with documented high risk among both the intervention and non-intervention groups at baseline. Improvement in the proportion of evaluations were observed in the intervention group (18.6% to 20.5%) as compared to the non-intervention group (8.5% to 8.78%) (OR: 1.094 [CI 1.025-1.166]). When high-risk behaviors were documented, HCV testing improved in both groups (21.8% to 24.1% intervention and 22.01% to 24.6% non-intervention groups), the improvements were not statistically significantly better among the intervention group (OR .983; CL .715-1.351).

DISCUSSION / REFLECTION / LESSONS LEARNED: Improving clinical practice within contemporary overtaxed healthcare settings requires well-designed, continuous, and iterative interventions which include both education and data sharing. Even in the context of such initiatives, improvements are frequently slow. If HCV elimination is to become a reality, particularly in a climate of increased risks associated with the ongoing opioid epidemic, initiatives such as this one are critical.

SGIM LEADERSHIP IN HEALTH POLICY CURRICULUM INITIATIVE

Molly A. Fisher¹; Sarah G. Candler²; Susan Lane⁴; Colin Robinson³; Latonya Riddle-Jones⁵; Michi Yukawa⁶. ¹University of Pittsburgh Medical Center, Pittsburgh, PA; ²Baylor College of Medicine, Houston, TX; ³UCLA, Los Angeles, CA; ⁴Stony Brook Medicine, Stony Brook, NY; ⁵Wayne State University School of Medicine, Farmington Hills, MI; ⁶University of California San Francisco, San Francisco, CA. (Control ID #3185098)

NEEDS AND OBJECTIVES: 1. Conduct a Delphi survey of health policy and education experts to determine which health policy topics to teach to internal medicine residents 2. Create four one-hour lessons that focus on Medicare, Medicaid, social determinants of health, and private insurance and the healthcare marketplace 3. Implement and evaluate a pilot curriculum at participating institutions 4. Disseminate this curriculum to medical training programs to adapt to their home institutions
SETTING AND PARTICIPANTS: This curriculum is to be taught to internal medicine and med-peds residents. We have designed the curriculum so that it can be taught in either small group or large lecture settings. There are four separate one-hour lessons that can be taught independently or as a complete curriculum.

DESCRIPTION: Several major healthcare organizations have stated the importance of educating physicians to learn about health policy. However, there are no current guidelines on what information should be taught to physicians or trainees, and how this content should be delivered. Based on a Delphi survey of health policy experts conducted by the authors, four major topics were identified as essential components of a health policy curriculum for internal medicine residents: Medicare, Medicaid, social determinants of health, and private insurance and the healthcare marketplace. Members of the SGIM Leadership in Health Policy (LEAHP) fellowship worked to create four one-hour lessons based on these topics. Each lesson consists of a didactic component and a group activity. The authors of this curriculum plan to pilot the curriculum at their home institutions during the 2019-2020 academic year. Once the pilot year is complete, a standardized evaluation tool that assesses attitudes and knowledge will help to inform the authors on how to alter the curriculum prior to dissemination. Once edited, we intend to disseminate this curriculum through the Society for General Internal Medicine Health Policy Committee. Future plans include teaching the curriculum at the medical student level and creating additional modules to teach if more curricular time is available.

EVALUATION: We developed a standardized evaluation tool that will assess the knowledge and attitudes of the residents participating in the program. It is a pre-survey and post-survey that we will administer shortly after completing the program.

DISCUSSION / REFLECTION / LESSONS LEARNED: Creating this curriculum has been a large multi-institutional effort with faculty members from a wide variety of backgrounds. Through the pilot project, we intend to find areas of improvement in the way the content is delivered as well as adapting the activities as needed.

SHOW ME THE MONEY! RESULTS FROM A PILOT FINANCIAL WELLNESS PROGRAM FOR INTERNAL MEDICINE RESIDENTS

Patricia Ng; Rachel Wong. Stony Brook University School of Medicine, Port Jefferson Station, NY. (Control ID #3160604)

NEEDS AND OBJECTIVES: Financial wellness has become a topic of interest, with a 2012 study showing that higher educational debt is associated with lower quality of life and increased burnout rates. Our initial needs assessment identified several resident profiles with varying financial capabilities and concern for personal debt. Our aims were to pilot and assess the efficacy of a tailored financial wellness program in improving the finance planning behaviors of internal medicine residents.

SETTING AND PARTICIPANTS: Our pilot program was offered to 84 categorical and 10 preliminary internal medicine residents at a university-based program in Stony Brook, NY during the 2017-2018 academic year.

DESCRIPTION: Our pilot program was created by faculty champions and an institution hired financial advisor. The program included 90-minute interactive workshops and a mandatory mid-year financial wellness check-in with program directors. Workshops were given during intern orientation to capture new interns and in the evening to target seniors. Program topics included loan repayment, budgeting, retirement planning, and income protection. During mid-year check-ins, program directors inquired about financial stress during overall wellness screening and ensured that all residents were aware of local financial resources. Residents also received educational handouts and simplified financial planning to-do lists created by faculty developers.

EVALUATION: Residents completed surveys immediately before and after the workshop, and a follow-up survey at the end of the year. Surveys included modified questions from the FINRA National Financial Capability Survey and feedback about the intervention. Fifty-three (56.4%) residents completed the pre-workshop survey, 49 (52.1%) completed the post-workshop survey, and 40 (42.6%) completed the follow-up survey. Majority (97.9%) rated the workshops "Good/Excellent" and all requested additional didactics. At the end of the year, residents reported improvements in several positive financial planning behaviors. For debt management, more residents reported creating a student loan repayment plan (43.4% vs 58.8%) and consolidating to the public service loan forgiveness program (29.4% vs 74.1%). For savings and retirement, there was a statistically significant increase in residents being aware about their employers' retirement plans (73.6% vs 94.2%, p=0.0113) and contributing regularly to retirement (11.3% vs 35.3%, p=0.0214). Lastly for catastrophic planning, there was a statistically significant increase in residents having rainy day funds (30.8% vs 65.0%, p=0.0007).

DISCUSSION / REFLECTION / LESSONS LEARNED: Our results suggest that a tailored financial wellness program may improve financial planning behaviors of internal medicine residents. When planning a financial wellness program, interventions should include local financial experts, simplified to-do lists, and multiple didactic sessions. We plan to assess for generalizability of our program by implementing similar financial wellness programs at 2 other internal medicine residency programs.

SMARTPHONE DEVICE FOR OPHTHALMOSCOPY SIMULATION TRAINING IN UNDERGRADUATE MEDICAL EDUCATION.

Patricia Nelson²; xin lu²; Marah Hamdan²; Akaanksh Shetty²; Jessica R. Hungate²; Thwe Htay¹. ¹Texas Tech University HSC El Paso, El Paso, TX; ²Texas Tech University Health Sciences Center, El Paso, TX. (Control ID #3184781)

NEEDS AND OBJECTIVES: The objective of this study is to measure the effectiveness of using a reproducible smartphone imaging for ophthalmology simulation training in enhancing learners' confidence and skill technique in imaging the retina.

SETTING AND PARTICIPANTS: The setting of this study involved surveying 96 second year medical students new to the study of observing the eye during clinical skill training.

DESCRIPTION: The students were asked to compare the proficiency and ease of use of a traditional direct ophthalmoscope versus a new smartphone enabled imaging device. Each student was given pre-recorded instructional videos and directions prior to the use of both devices in order to ensure proper understanding of observing methods. The students were given pre-training surveys prior to the instructions on how to use the Ophthalmoscope and the imaging device, as well as a similar post training survey. The survey measured confidence on a 5 point scale. 88 responses were included in the study analysis.

EVALUATION: There was a low pre-survey confidence in imaging the retina, including obtaining the red reflex. "Not all confident" was ranked 42% for using a direct ophthalmoscope, 56.8% for identifying the red reflex, 58% for focusing on the optic nerve head, 63.6% for focusing on the fovea, 48.9% for focusing on an artery or vein, 63.6% for apertures and filters, and 35.2% for differentiating healthy vs. pathologic retina. Post training surveys showed a significant improvement in confidence. "Not at all confident" was ranked 0% for using the direct ophthalmoscope, 2.3% for identifying the red reflex, 0% for focusing on the optic nerve head, 4% for focusing on the fovea, 1.1% for focusing on an artery or vein, 57% for apertures and filters, and 2.3% for differentiating healthy vs. Pathologic retina.

DISCUSSION / REFLECTION / LESSONS LEARNED: Ophthalmoscopy allows for the non-invasive evaluation of patients eyes microvasculature, permitting direct detection of end organ pathology. Given its importance, it is a difficult skill for medical students to learn. Medical students often have a few contact hours of training on the direct ophthalmoscope throughout the undergraduate medical education. In addition, our questionnaire showed that 82 students (92.3%) did not own a direct ophthalmoscope, which limits the opportunity of further independent skill development. This study shows that simulation training in ophthalmology appears to be an effective method in increasing learners confidence in skill technique and identifying retinal structures. Additionally, 47% of students preferred the smartphone imaging device to the direct ophthalmoscope. The imaging device is 3-D printed, inexpensive, and allows for direct retinal photography that could be used to educate the patient. This indicates that this method could be used in undergraduate medical education in conjunction with the traditional ophthalmoscope.

SOCIAL DETERMINANTS AND HOME VISITS

Achilia Morrow¹; Amy Baldwin²; Laurel B. Murrow³; Suzanne H. Lester¹.

¹AU/UGA Medical Partnership, Athens, GA; ²AU / UGA Medical Partnership, Athens, GA; ³Mercy Health Center, Athens, GA. (Control ID #3163251)

NEEDS AND OBJECTIVES: Social determinants play a major role in health and many medical schools have introduced curricula to teach these principles. However, early on, students may not connect the material to actual patient care. This year patient care was introduced into the award-winning community health course at the AU/UGA Medical Partnership to facilitate student understanding of the role of social determinants in patient management.

SETTING AND PARTICIPANTS: The community health course is a service-learning course that occurs during the first year of medical school. Students are placed in groups of 8-9, assigned 2 faculty preceptors (one clinical, one non-clinical), and then paired with a community organization. Our community partner, Mercy Health Center, is a free clinic serving uninsured patients in Athens-Clarke and surrounding counties.

DESCRIPTION: Students conduct home visits for selected patients. Visits include taking a history inclusive of the social determinants of health, developing a plan with guidance from their preceptors, and adding a note about the encounter to the patient's chart. Templates and prompts were provided to help students gather this information. Students completed reflective writing and presented "exemplar" patients to the entire class.

EVALUATION: Workshops and reflections have revealed that students have identified factors beyond patient control, have broadened their view of "who uninsured patients are," recognized the role of family/social support, and appreciated patient difficulties navigating the health care system. Surveys conducted at the beginning and end of the course will be used to formally gauge changes in student perspectives.

DISCUSSION / REFLECTION / LESSONS LEARNED: In addition to allowing students to identify social determinants that affect their patients' health, these visits have also provided early learning opportunities for the management of chronic diseases, including depression, role of specialty referrals, and how fragmentation of care can affect health. Additionally, promotion of a team approach has led to the investigation of legal assistance, transportation solutions, and assistance from community agencies. These early experiences will allow students to continue to recognize and incorporate these factors into patient care as they progress through their careers.

SPANISH FOR MEDICAL PROFESSIONALS (INTERMEDIATE LEVEL).

Josune N. Iglesias. Rush University, Chicago, IL. (Control ID #3185744)

NEEDS AND OBJECTIVES: Objectives: 1-Communicate in Spanish with Spanish speaking patients at an intermediate level. 2- Students will be able to communicate in simple Spanish using mainly the present tense with the 3rd person "usted" and different expressions to indicate past and future actions. They should be able to utilize specific medical terms learned in class. 3- Students should be able to communicate with Spanish speaking patients and take a chief complain, history of present illness, past medical history, medication list and allergies.

SETTING AND PARTICIPANTS: The elective course runs throughout the M1 year (first year) in small groups (10-16 students) with an intermediate level of knowledge of Spanish. Two hour per small group session and one hour online work per week of classes. Taught with lectures and in small group activity by a native Spanish speaker faculty. The course is organized with emphasis to integration of topics covered in the new organ based curriculum.

DESCRIPTION: This course addresses the needs of medical students with intermediate experience in Spanish. Students participate in language tasks through listening, reading, writing, and conversation. Classes will be taught in Spanish in order to immerse students in the target language. This medical Spanish Course consists of: a. Formal instruction: There are in-class activities, such as role-playing and history taking. Students also expand their Spanish vocabulary with an emphasis on medical terminology. I- Introduction to the patient. II- Chief complaints III- History of Present Illness IV- Chest pain V- Shortness of breath and Past medical history VI- End Stage Renal Disease and Past medical history VII- amenorrhea and Urinary Tract Infection VIII- Mid term exam IX- Rash and Itching/ Medication list X- Angioedema and medication list XI- New patient and allergies XII- Upper respiratory tract infection XIII- Ear pain XIV- Headache XV- Abdominal pain XVI- Final Exam/ Oral test b. Extracurricular activities and independent study via internet resources This course also includes a series of cultural extracurricular activities and Spanish language websites for students to practice Spanish independently outside of the classroom. By visiting a

hispanic neighborhood near our institution and watching movie sessions, students will be able to engage in Spanish learning activities.

EVALUATION: I. Daily class participation (4 x 10 points each) 40% II. Attendance (10points) 10% III. Quizzes (100 points) 10% IV. Midterm exam (100 points)10% V. Oral exam (100 points) 15% VI. Final exam (150 points) 15%

DISCUSSION / REFLECTION / LESSONS LEARNED: This is the first Intermediate Medical Spanish course in our institution driven by the need to learn spanish and communicate with our community in their native language. The eagerness of our medical students and leadership to learn medical Spanish has been instrumental. This course will improve by practicing history taking with Standardized Spanish speakers patients

STEMMING THE RED TIDE: DESIGN OF AN INEXPENSIVE MANNEQUIN TO TEACH TEAMS TO MANAGE MASSIVE VARICEAL BLEEDING.

Jorge Lara-Gutierrez; Erika L. Hoffman; Mary Ellen Elias. VA Pittsburgh, Pittsburgh, PA. (Control ID #3182929)

NEEDS AND OBJECTIVES: Variceal hemorrhage is an example of the type of medical emergency that requires efficient care provided by a rapid response team. Teams must simultaneously ensure hemodynamic stability, airway protection, prevention and treatment of complications, and management of the bleeding. Balloon tamponade is an option for temporarily stopping bleeding from esophageal or gastric bleed while definitive treatment is being arranged. Simulation can be used to teach nursing staff to gather the appropriate equipment, to maintain the device after insertion, and to set up the traction and weights needed. It can also be used to help teach clinicians how to insert the tube and to inflate the balloons in the correct order to decrease potential complications. This type of simulation was felt to be essential for employee development to increase comfort with the equipment. We were not able to find a mannequin that possessed the desired capabilities. Our objective was to create a mannequin to facilitate team-based training and to provide the opportunity to practice responding to this scenario in a safe learning environment.

SETTING AND PARTICIPANTS: Training will take place in a simulated emergency department at the VA Pittsburgh Healthcare System. A scenario was created in which a patient with cirrhosis presents with massive hematemesis. Participants will be attending physicians, fellows, residents, and nurses from the emergency department and the intensive care unit.

DESCRIPTION: To address the need for a specialized mannequin a multidisciplinary planning team was formed. Participants included critical care & ER attending, a simulation fellow, dentists, speech pathologists, and a biomedical engineer. The team identified that the simulator needed to allow faculty to teach teams to intubate the patient & to insert and inflate tamponade tubes in the correct order during active bleeding. An old Laerdal mannequin was modified.

EVALUATION: A checklist has been created for each type of learner. Physicians will be assessed on treatment priorities in this clinical scenario including airway management, and balloon tamponade insertion. Nurses will be assessed on the ability to gather the correct supplies needed for insertion and to secure and maintain the balloon tamponade tube. They will learn safe set up of the over the bed traction and how to use the massive transfusion pump.

DISCUSSION / REFLECTION / LESSONS LEARNED: To create the level of fidelity deemed important by a multidisciplinary team, a full body mannequin was built utilizing an old Laerdal mannequin, a rebuilt upper airway and GI tract, a water pump, and a soda bottle. We can simulate

massive upper GI bleeding. The mannequin can be intubated, and a balloon tamponade tube can be inserted & inflated. The trainer can be replicated and at the cost of less than 200.00 USD. A team-based employee development curriculum has been created to help improve comfort with handling massive upper GI bleeding which is a low-frequency high-risk event. We are training our initial team and collecting data.

STICKING TO THE SCRIPT: USING ILLNESS SCRIPT GRIDS TO SCAFFOLD LEARNING FOR PRE-CLERKSHIP MEDICAL STUDENTS

McKinsey M. Pillsbury¹; Sirisha Narayana^{1, 1}; Susannah Cornes^{1, 1}; Denise M. Connor^{1, 2}. ¹University of California, San Francisco, San Francisco, CA;

²University of California, San Francisco and San Francisco VA Medical Center, San Francisco, CA. (Control ID #3181351)

NEEDS AND OBJECTIVES: Pre-clerkship medical students lack the clinical insights needed to structure their growing knowledge in ways that will optimize clinical reasoning. We sought to: • Establish the feasibility of using illness script grids to reinforce and structure early medical students' clinical knowledge • Determine pre-clerkship students' acceptance of illness script grids as a way to crystallize small group learning • Explore the feasibility of using freely available mobile software to create illness script libraries to encourage use in clerkships

SETTING AND PARTICIPANTS: All pre-clerkship UCSF medical students participate in a longitudinal diagnostic reasoning curriculum. In first year, reasoning workshops introduce illness scripts and compare/contrast (vertical) learning. In second year, students take a deep dive into clinical reasoning through a capstone course, the Diagnostic Reasoning (DR) Block.

DESCRIPTION: Students review an online module describing the illness script grid format and create grids for clinical syndromes discussed in reasoning workshops as wrap-up work. Key and differentiating features of diagnoses relevant to a clinical syndrome (e.g. acute chest pain) are entered in an illness script format (predisposing factors, clinical features, time course, pathophysiology). Model grids are released to students, who also receive personalized feedback on one grid. Students use free, mobile-based software (e.g. GoogleDocs) to construct grids with an illness script template. This system (ScriptSmart) enables students to construct an illness script library organized around core clinical problems. Students can access, modify, and share this library in multiple settings, and can enrich scripts during clerkships.

EVALUATION: Students complete a survey after the DR Block, including questions evaluating their impression of illness script grids. We will analyze responses to determine acceptability and feasibility of using grids to structure learning. An IRB proposal is underway to enable us to disseminate this data, and we anticipate including this analysis if accepted at SGIM. Future work will include study of clerkship students to assess the impact of early exposure to illness script grids, and optimization of ScriptSmart using human-centered design.

DISCUSSION / REFLECTION / LESSONS LEARNED: In medical schools across the United States, students are entering clinical settings earlier in training, requiring new approaches to support early integration of clinical and classroom-based knowledge. Solidifying learning using compare/contrast illness script grids has the potential to help students build mental frameworks that support their clinical reasoning. ScriptSmart is a practical way to scaffold clinical knowledge and reinforce clinical reasoning concepts. The use of freely available software to create a personalized, searchable, and modifiable mobile illness script library represents a novel way to model knowledge acquisition and encourage integration during clerkships.

ONLINE RESOURCE URL (OPTIONAL): ScriptSmart module: <https://ucsf.box.com/s/z2gga2iuuwpul183sooly6krtmj3ggi>

STRETCHING BEYOND CLERKSHIPS: A LONGITUDINAL POST-CLERKSHIP COURSE IN SOCIAL MEDICINE

Michelle Cleeves¹; Margaret Tomcho²; Jennifer Adams². ¹Denver Health and Hospital Authority, Denver, CO; ²Denver Health, Denver, CO. (Control ID #3183888)

NEEDS AND OBJECTIVES: The University of Colorado Denver Health Longitudinal Integrated Clerkship (DH-LIC) is based at an urban safety-net hospital. Nationally, there is variability in how post-clerkship students and medical schools structure learning,¹ and debate over best utilization of this time. A needs assessment of DH-LIC students (n=12) demonstrated high interest in a post-clerkship elective. Based on these results, the Longitudinal Social Medicine Elective (LSME) was implemented and encompasses a mentored project and a course in social medicine. Primary goals were to allow students to continue mentorship relationships with faculty, engage in mentored scholarly work, and further develop knowledge and skills in social medicine.

SETTING AND PARTICIPANTS: Students in the DH-LIC were eligible to enroll in the LSME during their fourth year. Currently, the elective is in its second year and has enrolled nine students over two years (from 16 eligible LIC students).

DESCRIPTION: Students identify a capstone project in the umbrella areas of medical education, community engagement, or quality improvement (QI). The course also includes a week-long intensive course in social medicine encompassing topics such as trauma-informed care, implicit bias, correctional care, and health care for the homeless, as well as service learning and reflective writing. The capstone of the course is student presentations of project work to peers, faculty and health system and community leaders. Illustrative examples of projects include: utilization of palliative care in the SICU, a qualitative study of impact of LIC students on patient satisfaction, development of a radiology curriculum for LIC students, implementation of a service learning curriculum for LIC students, and a collaborative QI project to improve primary care engagement for patients with serious mental illness.

EVALUATION: Students rated their overall satisfaction with the course as high to very high (100%) and all students felt this elective filled an important gap in their education. 100% reported their interest in practicing at Denver Health after residency was high or very high at completion of the longitudinal immersive course. To assess long-term impact on career focus on underserved care, scholarly work and advocacy, graduates of the program will be surveyed annually.

DISCUSSION / REFLECTION / LESSONS LEARNED: Strengths of this innovation include meaningful projects that serve the Denver Health community and allow students to produce scholarly work. Student participation strengthened student commitment to the underserved and understanding of social medicine.

STUDENT-DIRECTED COMMUNITY ENGAGEMENT PROJECTS AS A LEARNING LABORATORY FOR PHYSICIAN LEADERSHIP - A SIX-YEAR EXPERIENCE

Brent C. Williams¹; Joy C. Williams¹; Jason Bell¹; Katherine L. Hughey¹; Patricia Mullan¹; Andrew J. Haig². ¹University of Michigan, Ann Arbor, MI; ²The University of Michigan, Ann Arbor, MI. (Control ID #3185312)

NEEDS AND OBJECTIVES: Two challenges facing medical schools in fostering students as leaders in community-engaged healthcare are: a) few

leadership curricula include content based on medical students' perceived needs, and b) true collaborations between students and community-based organizations (CBOs) (as opposed to service-learning) are difficult due to student turnover and full curricula. Our objective was to design a community-based 'learning laboratory' to promote leadership skills in academic-community collaboration through reflection-on-action.

SETTING AND PARTICIPANTS: Second year medical students in an elective co-curriculum in health disparities at University of Michigan Medical School from 2012 to 2017.

DESCRIPTION: Each year, teams of 4-6 students were tasked to engage with a CBO of their choice over 5-7 months to complete a 'Mini Field Project'. Initially the assignment was kept small, requiring only structured interviews or site visits. Later, the task was expanded to require collaborating with a CBO to design and complete a project resulting in a 'deliverable' to the CBO. At the mid- and endpoints of the assignment teams wrote structured reflective narratives on physician leadership and organizational collaboration. After completion teams presented their projects to each other using persuasive, creative formats. Over the six years, 174 students formed 45 teams to engage with 38 CBOs. 15 projects consisted of interviews only; 5 were site visits; and 25 were projects, 21 of which were completed.

EVALUATION: In early years, students' observations on physicians as leaders included traditional features of leadership (e.g., strategic vision) along with non-traditional domains (e.g., professional identity development, work-life balance). In later years prompts related to the non-traditional topics were included in the reflective narrative reports. Annual student feedback on the value of the Mini Field Projects was highly positive. Feedback on work burden for this extracurricular activity informed the size and scope of projects over time. A one-time survey of CBO experience (Year 2) was highly positive.

DISCUSSION / REFLECTION / LESSONS LEARNED: Mini Field Projects are now a standard component of the health disparities co-curriculum, and have been highlighted by the medical school as exemplary community engagement by our students. Our next goals are to continue projects at individual sites over several years, and involve students in other health professions schools to promote interprofessional education in community settings.

SUCCESSFUL IMPLEMENTATION OF A REFLECTIVE PRACTICE CURRICULUM IN AN INTERNAL MEDICINE RESIDENCY TRAINING PROGRAM

Julie M. Chen²; Joseph Maciuba¹; Joan B. Ritter¹; Sarah Ordway¹. ¹Walter Reed National Military Medical Center, Bethesda, MD; ²Kaiser Permanente Mid-Atlantic States, Rockville, MD. (Control ID #3167936)

NEEDS AND OBJECTIVES: Redesign of internal medicine programs has led to the transformation of the ambulatory experience to block scheduling systems. However, block schedules decrease continuity between learners and teachers with consequent challenges in developing longitudinal relationships that contribute to professional identity formation. Additionally, burnout during residency has led to an increased need for a forum to discuss factors that lead to burnout and its mitigation. This presentation outlines a novel approach using reflective practice to cultivate professional identity formation and promote continuity for faculty and trainees. It provides one platform to foster resilience, joy and meaning in medicine through an innovative curriculum.

SETTING AND PARTICIPANTS: The participants were 75 internal medicine residents and 30 faculty. Novel reflective practice tools were used successfully in a large internal medicine residency. There were 15 reflective practice groups, each consisting of 5 trainees/2 faculty facilitators. The reflective practice curriculum included readings, videos and TED talks, artwork and

different scenarios that promote reflection/discussion of pertinent topics (burnout, caregiver fatigue, etc.).

DESCRIPTION: It is imperative to address professional identity development and resiliency during residency training. However, the challenges to implementation are ever-increasing with productivity demands on clinician-educators. Over one academic year in this IM residency, reflective practice groups held 2-hour sessions every 10 weeks during duty hours. Sessions were mandatory, and residents had no clinical responsibilities during this time. Reflective practice groups followed a curriculum for one year, using several tools for creating a safe environment that fostered camaraderie and dedicated time to introspection and shared reflections between faculty and trainees.

EVALUATION: Residents and faculty surveys on the effectiveness of the reflective practice sessions were administered at the 12- and 20-month mark after implementation of the curriculum. The response rate was 60% overall. Results include the perceived value of sessions (quantitative ratings and qualitative feedback), and topics that the residents found to be most beneficial or would like added. Data includes ratings of attitudes regarding the helpfulness of this curriculum.

DISCUSSION / REFLECTION / LESSONS LEARNED: Reflective practice helped guide residents and physicians in this residency program to become more aware of their personal context, biases and reactions while addressing significant topics such as providing equitable care. It also addressed personal feelings of physician burnout and fatigue, as well as how to continue fostering joy and meaning in medicine. Data after one year revealed that medicine residents surveyed rated compassion fatigue, resilience, mistakes and guilt/shame as the most important topics, and the majority would choose to continue the reflective practice curriculum.

ONLINE RESOURCE URL (OPTIONAL): <http://reflectivepractice.net/institution/walter-reed-internal-medicine-residency/>

SURVEY OF LEADERS OF U.S. PRIMARY CARE INTERNAL MEDICINE TRAINING PROGRAMS: EXPLORING GRADUATE CAREER PURSUITS

Robin Klein²; CAITLIN ANDERSON¹; Samantha Alonso²; Nour Chams²; Anu Kurl¹; Katrina Lim³; Caitlin Taylor²; Akanksha Vaidya³; Stacy Higgins³. ¹Emory University School of Medicine, Atlanta, GA; ²Emory, Atlanta, GA; ³Emory University, Atlanta, GA. (Control ID #3185275)

NEEDS AND OBJECTIVES: There is a critical shortage of primary care physicians in the United States. To address this need, specialized Primary Care Internal Medicine (PC IM) residency programs provide dedicated training in ambulatory medicine. Literature assessing the ultimate career pursuits of PC IM graduates is limited. We aimed to explore the career choices of PC IM graduates and to identify program features that were associated with more graduates remaining in General Internal Medicine (GIM).

SETTING AND PARTICIPANTS: We conducted a cross sectional survey of Program Leaders of PC IM training programs or tracks in the United States.

DESCRIPTION: We identified PC IM programs via the National Resident Matching Program, the American Medical Association's Fellowship and Residency Electronic Interactive Database, and individual program websites. Forty-five of the 70 programs identified as PC IM training programs or tracks completed the survey (64% response rate).

EVALUATION: Program leaders report that 55.8% of graduates within the last 5 years pursued PC or GIM careers, 23.1% pursued subspecialty fellowship training (i.e. cardiology) and 10.3% pursued primary-care oriented fellowship (i.e. geriatrics). Amount of training time in ambulatory settings, but not the number of continuity clinic sessions, was mildly associated with PC IM graduate career choices. Less ambulatory time was associated with more

graduates pursuing subspecialty fellowship training (correlation coefficient -0.38, p value 0.02). There was no significant association between careers in PC or GIM and program size, age of program, number of continuity clinic sessions, number of continuity clinic sites, number of patient visits per continuity clinic session, breadth of subspecialty ambulatory rotations required or widely available, or breadth of topics included in PC curriculum.

DISCUSSION / REFLECTION / LESSONS LEARNED: Dedicated PC IM programs serve a critical role in addressing the shortage of primary care physicians in the U.S. We found that more than half of PC IM residents choose careers in PC or GIM. Less ambulatory time, but not less continuity clinic exposure, was associated with more graduates pursuing subspecialty fellowship training. This suggests that increasing ambulatory exposure across subspecialty clinics may be more effective at increasing the PC workforce than increasing time in continuity clinic. Future research could identify specific features of ambulatory exposure and of continuity clinics that are associated with more graduates pursuing careers in GIM.

TEACH THE TEACHER MODEL: AN INNOVATIVE METHOD FOR DEVELOPING A POINT OF CARE ULTRASOUND CURRICULUM WITHIN A LARGE ACADEMIC INSTITUTION

Christopher T. Kelly¹; Felix J. Nau¹; Casey Glass²; Chaudry N. Majeed¹. ¹Wake Forest, Winston Salem, NC; ²Wake Forest, Winston-Salem, NC. (Control ID #3183781)

NEEDS AND OBJECTIVES: Point-of-Care Ultrasound (POCUS) enhances the physical exam and is emerging as a necessary skill in modern medicine. Designing an Internal Medicine (IM) resident POCUS curriculum is difficult with limited faculty who are trained and comfortable using ultrasound. Our objective is to circumvent this obstacle and promote a cultural shift towards embracing bedside ultrasound by creating a "teach the teacher model" as the foundation of our IM POCUS curriculum.

SETTING AND PARTICIPANTS: In July 2018, 105 IM residents were in need of ultrasound training and only 1 inpatient POCUS trained IM faculty was available for teaching. 25 upper level residents received early structured POCUS training from July through September to be "POCUS champions." They went on to be peer instructors alongside faculty during workshops and in the clinical setting the remainder of the year.

DESCRIPTION: Training begins with POCUS lectures on the lung, heart, and IVC followed by hands on workshops with standardized patients. POCUS champions participate in gel rounds, where they perform 25 lung, heart, and IVC exams on real patients under trained faculty supervision. They must demonstrate proficiency before training other residents. In the multiplier phase, POCUS champions become mentors for 4-5 untrained residents and are allowed to supervise exams. All untrained residents are expected to complete 25 supervised lung, heart, and IVC exams by the end of the academic year. The rising PGY2s and PGY3s with the most interest and skill are selected to be the new POCUS

champions the subsequent year. The current curriculum focuses only on cardiac and pulmonary imaging. It will expand to cover other organ systems and POCUS education will be further augmented through additional training methods.

EVALUATION: A survey prior to implementing the curriculum showed that over 70% of residents felt uncomfortable or very uncomfortable performing POCUS exams. 21 of the initial 25 residents received their POCUS champion teaching privileges at the faculty's discretion. The curriculum is still in its early stages so compiled data is limited. We plan to evaluate the curriculum and resident POCUS proficiency in the following ways: 1) annual surveys to assess resident comfort; 2) tracking exams to measure POCUS use; 3) remote

image assessment to evaluate quality; 4) tests to assess knowledge, image interpretation, and clinical application.

DISCUSSION / REFLECTION / LESSONS LEARNED: POCUS is not meant to replace radiology or cardiology expertise, but using POCUS as an extension to the physical exam is becoming an essential skill in general medicine. Our "teach the teacher" model overcomes the obstacle of having limited faculty who are comfortable using and teaching ultrasound by distributing the responsibility for POCUS education to the stakeholders themselves. Upper level residents perpetuate a continuous cycle to teach POCUS and interns have the opportunity to learn while simultaneously taking care of their hospitalized patients. This helps produce a cultural shift towards using POCUS within IM.

TEACHING DIGITAL PROFESSIONALISM AND ASSESSING PHYSICIAN BEHAVIOR CHANGE

Katherine Wrenn; Kelly L. Graham. Beth Israel Deaconess Medical Center, Boston, MA. (Control ID #3181078)

NEEDS AND OBJECTIVES: Social media use has rapidly grown and is high among medical trainees. Their use raises privacy issues and concerns about boundaries in the patient-physician relationship. There is an emerging body of literature about social media use among medical trainees and physicians, leading the AMA, ACP, and FSMB to publish guidelines on appropriate use. However, there is minimal evidence or guidance about how best to teach medical trainees about digital professionalism. Therefore, we aim to (1) develop a novel curriculum for IM residents on digital professionalism, and (2) assess whether participation in the curriculum leads to changes in attitudes, behavior, and social media use among this population.

SETTING AND PARTICIPANTS: All residents in the IM Residency Program at Beth Israel Deaconess Medical Center were invited to participate in our study, which took place during their ambulatory medicine curriculum. While attending the didactic session was required, participation in the study was voluntary.

DESCRIPTION: The case-based curriculum is delivered in a 90-minute small group session. Residents discuss cases related to patient and physician privacy, the patient-doctor relationship, and professionalism. During discussion, we present guidelines on digital professionalism and social media use, along with data on unprofessional behavior among medical trainees and its implications. Prior to participating, residents complete a pre-survey, which includes demographic information, confounding variables such as previous exposure to digital professionalism training, an assessment of specific behaviors relating to digital professionalism, and attitudes about these behaviors. Following the session, residents complete a post-survey. This presents the same checklists of attitudes and behaviors, and asks whether they are likely to change their behavior after participating in the curriculum. Two months later, residents receive a second post-survey, asking them to identify whether or not they changed these specific behaviors. The BIDMC IRB deemed the study exempt.

EVALUATION: Data collection is ongoing. We will compare responses from pre- and post-surveys to determine if residents' attitudes about social media use and digital professionalism change after participating in the curriculum, and how likely residents feel they are to change behaviors after participating. By incorporating a delayed post-survey, this will also be a durability study, to assess whether residents indeed changed their behaviors. We will conduct analysis of attitude and behavior change pre/post using McNemar's test for paired data.

DISCUSSION / REFLECTION / LESSONS LEARNED: With a growing number of studies citing unprofessional behavior among medical trainees,

there is a need for enhanced training in digital professionalism. We developed and implemented a novel, case-based curriculum for residents to help meet this need. Initial feedback has been positive, and we will perform an analysis to determine if residents' attitudes and behavior change after participating in the curriculum.

TEACHING HAND OFFS TO JUNIOR MEDICAL STUDENTS: IMPACT OF AN EDUCATIONAL INTERVENTION

Diane L. Levine; Omar M. Saaed. Wayne State University, Detroit, MI. (Control ID #3185930)

NEEDS AND OBJECTIVES: Handoff is the process of transferring medical information from one healthcare provider to another and is crucial for safe patient care. A survey of Medicine Program Directors found an important skill for incoming interns was the ability to provide a prioritized and organized written hand off and conduct an organized verbal hand off. This provides impetus to educate medical students and provide opportunities to practice and develop handover skills. Although studies on handovers have been published (Acad Med.2009;84,1775-87), few focus on students. We delivered educational training to medical students to prepare them to handover independently.

SETTING AND PARTICIPANTS: Students on the Medicine clerkship viewed material about handovers including the importance of sign-out, consequences of inadequate sign-out, content of oral and written sign-out, and use of I-PASS. They completed a formal written sign-out using I-PASS, observed resident's handovers, and completed surveys about their perceptions of the safety of handovers and how prepared they felt to provide a handover in the future. Student written sign-outs were evaluated using a scoring system we developed; 2 points were assigned for each component of IPASS (0-missing/inadequate/non-actionable; 1-unnecessary, nonspecific information, limited detail, hard to follow; 2- appropriate detail, specific information, actionable, easy to follow,) for a potential score of 8.

DESCRIPTION: 123 students rotated on the clerkship. Sign-outs were submitted by 123; 2 were illegible; 121 were analyzed. 19% scored 8, 5% scored 7, 17% scored 6, 35% scored 5, 11% scored 4, 7% scored 3, and 2% scored 2. Analyzing only by Action List (AL) and Situation Awareness (SA) resulted in 23% scoring 4, 61% scoring 2, 7% scoring 1 and 6% scoring 0. Students who scored 2 on AL all scored 2 on SA. 93% of students who scored 2 AS scored 2 on AL. Average sign-out scores were calculated by rotation block. Students on the first 8 week block scored 5.2, 5.4 on the second block and 5.8 on block 3. 117 completed the sign-out observation survey; 108 completed sign-in survey. Approximately one third observed handovers that had elements that decreased safety (distractions, interruptions). More than half felt prepared or very prepared to provide a handover. Approximately 40% felt somewhat prepared, 3% did not feel prepared.

EVALUATION: Introducing students to hand overs during a clinical clerkship is feasible, however, students require additional practice to develop competency in this skill.

DISCUSSION / REFLECTION / LESSONS LEARNED: An educational intervention to teach junior students to handover and perform sign-outs demonstrated students were able to complete sign-outs using IPASS. Although most felt prepared to perform sign-outs only a quarter included crucial information necessary for safe handovers. A single educational intervention was sufficient to train students to perform sign-outs but was not sufficient to ensure competency for all students. Performance increased with each block possibly due to clinical experience.

TEACHING PRACTICAL RESPONSES TO SEXUAL HARASSMENT IN MEDICINE: REFLECTIONS FROM A NATIONAL WORKSHOP

Emmanuelle B. Yecies^{1,2}; Amy H. Farkas³; Melissa McNeil⁴. ¹University of Pittsburgh School of Medicine, Pittsburgh, PA; ²VA Pittsburgh Healthcare System, Pittsburgh, PA; ³Medical College of Wisconsin, Milwaukee, WI; ⁴University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #3185065)

NEEDS AND OBJECTIVES: In the wake of the #MeToo movement, it is imperative that the medical field address sexual harassment rapidly to improve the work environment of our physicians and trainees. Little has been done to provide guidance and training on appropriate responses when experiencing or witnessing harassment, leaving many physicians feeling powerless and unsure of how to proceed when such instances do occur. Compounding the difficulty, harassment in medicine comes from a multitude of sources, with patients complicating the traditional colleague hierarchical paradigm. We aimed to develop a workshop providing a repertoire of responses to incidents of experienced and witnessed sexual harassment that participants would find useful and applicable to academic Internal Medicine settings.

SETTING AND PARTICIPANTS: The workshop was presented at the Association of Program Directors of Internal Medicine (APDIM) national meeting in Orlando, Florida in October 2018. Approximately 50 participants were in attendance from across the country.

DESCRIPTION: We began the workshop with a review of the current data on sexual harassment in medicine. We then reviewed guiding principles and provided a handout of approximately 40 sample responses, organized by situation and source. Examples of responses included "I prefer to be addressed as...." and "Let's keep things professional." In small groups, participants had the opportunity to develop skills and practice responses to different scenarios including experienced and witnessed instances of sexual harassment, from both patients and colleagues. Evaluations were submitted through the standardized APDIM system.

EVALUATION: Twenty-eight evaluations were returned. For "relevance of content to your job," "quality of speaker as a content leader," and "overall satisfaction with the session," participants rated the workshop 4.76, 4.68, and 4.75, respectively (1-5 Likert scale, average for conference 4.40). Free-text comments included: "This was a great session! Being able to walk out with scripts for a variety of situations [as] both a target and observer made the entire conference worthwhile!!! Thank you" and "Challenging, yet clearly and well presented. I have tangible practical takeaways that I am planning to start implementing with my residents. Thank you for doing this!" The content has been requested for dissemination by three institutions.

DISCUSSION / REFLECTION / LESSONS LEARNED: The workshop was very well received by all in attendance and promoted lively discussion. Multiple participants expressed the desire to implement these educational methods at their institutions, and formal dissemination is already in process. Continued efforts are needed to incorporate these communication drills into the standard residency curriculum, explore their applicability to other settings, and evaluate their impact on real-life communication skills and confidence.

TEACHING SAFE AND EFFECTIVE OPIOID PRESCRIBING TO IM CLERKSHIP STUDENTS

Mim Ari; Amber Pincavage. University of Chicago, Chicago, IL. (Control ID #3184966)

NEEDS AND OBJECTIVES: Managing acute and chronic pain with opioids should optimally address the morbidity and mortality associated with

the opioid epidemic. A 2016 AAMC statement highlighted that for teaching on this topic to be most effective, experiences must be "reinforced throughout the continuum of medical education." Our objective was to update our current IM clerkship curriculum on pain management with evidence-based principles of safe and effective opioid prescribing.

SETTING AND PARTICIPANTS: Participants were IM clerkship students at the University of Chicago. The workshop was part of their required didactic experience.

DESCRIPTION: A 1-hour case-based workshop was created to discuss concepts that guide chronic opioid prescribing, recognize red flags for opioid misuse, learn how to screen for opioid use disorder, and manage acute pain appropriately. A pre-post survey was administered to assess the impact of the workshop on experiences, knowledge and confidence caring for patients on opioids during the IM clerkship.

EVALUATION: Forty-three students have participated in our workshop and completed pre-post surveys (100% response rate). During the IM clerkship, 81% and 75% of students care for patients on acute and chronic opioids respectively once per week or more. Seventy-nine percent cared for patients with opioid use disorder once per month or more. Despite frequent exposure, the majority of students were not familiar with guidelines for prescribing chronic opioids (79%), and not confident in determining appropriate acute pain regimens (90%) and identifying patient at risk for opioid use disorder (60%). On 5-point Likert scales of familiarity and confidence, completion of the curriculum was associated with increases in familiarity with guidelines (2.0 pre, 3.8 post, p <0.0001), confidence in determining acute pain regimens (1.6 pre, 3.4 post, p <0.0001) and identifying patients at risk (2.4 pre, 3.8 post, p <0.0001). Performance on 3 knowledge questions improved from 46%, 11% and 60% correct to 90% (p<0.001), 100% (p<0.001) and 90% correct (p=0.006). Ninety-five percent felt the workshop was helpful in practicing effective opioid prescribing and 98% reported gaining new knowledge

DISCUSSION / REFLECTION / LESSONS LEARNED: Implementing a workshop for third year medicine clerkship students focused on safe and effective opioid prescribing improved students' knowledge, familiarity and confidence. This limited and feasible curricular innovation shows promise, although more in-depth curricula throughout the continuum will be critical to address the opioid epidemic.

TEAM-BASED LEARNING: AN AMBULATORY CURRICULUM TO INSTILL COMPETITION, FUN, AND SELF-DIRECTED LEARNING INTO INTERNAL MEDICINE RESIDENCY EDUCATION

Siew May Wang; Marianne Reeves; Kelsey Black; Atsuko Yamahiro. MetroHealth System, Cleveland, OH. (Control ID #3183934)

NEEDS AND OBJECTIVES: Traditional lecture-based didactics are commonly used for educational conferences in internal medicine (IM) residency programs but remain a passive form of learning. Team-based learning (TBL) is commonly used in undergraduate medical education, as it is interactive and it promotes self-directed learning. We created a modified TBL curriculum at our residency program to foster active resident learning and to augment resident knowledge in common ambulatory topics.

SETTING AND PARTICIPANTS: All residents (n=68) participated in the TBL ambulatory curriculum at the MetroHealth System IM residency program. The residents follow a "4+1" schedule. During their fifth ambulatory week, residents have an educational half-day. Residents attended a two-hour TBL session during their educational half day. There were up to 18 residents per session. The TBL session occurred every week, and 10 topics rotated throughout the year.

DESCRIPTION: Each TBL session reviewed a common ambulatory topic. One week prior to each TBL session, residents received a relevant article to read based on the topic of the week (known in TBL as *pre-class preparation*). At the start of each TBL session, each resident completed a timed-quiz related to the topic, similar in format to the ABIM exam (*individual readiness assurance test*). The residents were then assigned to a team, to discuss the same questions to reach consensus answers (*readiness assurance test*). Following this, the facilitator led an inter-team discussion of the questions. Finally, a clinical vignette based on the topic was presented with questions for team discussion. Points were given to teams for each correct answer. Each session had a total number of points possible, and points were tracked for the all teams throughout the academic year. The point system is a modification from traditional TBL, as grades were not instituted.

EVALUATION: We administered anonymous surveys prior to the TBL sessions to all resident participants, measuring resident perceptions of lecture-based versus TBL-based teaching methods. Three months after the implementation of the TBL curriculum, we conducted post-TBL surveys to the same participants to gauge resident completion of pre-class reading assignments and their perception of TBL.

DISCUSSION / REFLECTION / LESSONS LEARNED: Most residents agreed or strongly agreed (93% to 98%) that TBL was well-suited to their learning style, felt engaged during the TBL sessions, and believed that TBL improved their clinical decision-making skills. The majority of residents (96% to 98%) also reported that this method nurtured positive interactions between peers. This study showed that most residents (87%) completed the pre-lecture reading most or all of the time, with the most common reason of self-directed reading as "being a valuable team player." Our data demonstrates that TBL is an effective teaching format to improve resident engagement in didactic sessions, team work, and motivation for self-directed learning.

THE ADVOCACY AND COMMUNITY HEALTH CHIEF RESIDENT: A NOVEL POSITION TO ENHANCE COMMUNITY ENGAGEMENT

Benjamin A. Howell¹; Sanjeet Baidwan¹; Lacey R. Whitmire²; Ross B. Kristal¹; Julie R. Rosenbaum³; Stephen J. Huot³; Tracy Rabin³. ¹Yale School of Medicine, New Haven, CT; ²Iora Primary Care, New Haven, CT; ³Yale University School of Medicine, New Haven, CT. (Control ID #3185657)

NEEDS AND OBJECTIVES: Effective community engagement enables physicians to collaborate with populations to improve health. To address these barriers to in residency training to learn about community engagement we created a chief resident position geared towards advocacy and community engagement and function as nidus for curricular and community-based experiential innovations. In 2015, we designed a novel position, Chief Resident for Advocacy and Community Health. The objectives for this chief resident are to: collaborate with the community to better understand local priorities, develop an integrated curriculum for physician advocacy and social justice, serve as a mentor to residents interested in advocacy and community engagement projects.

SETTING AND PARTICIPANTS: The setting is an academic medical center-based internal medicine-primary care residency program located in a mid-size northeast city. The local community is made up of a majority racial/ethnic minorities with ~25% living below the poverty line. The majority of patients served by the resident practice have Medicaid.

DESCRIPTION: The novel chief resident position, an addition to the existing chief resident group, was created with funding provided by the sponsoring institution. Primary roles include working with faculty to develop and co-lead a three-year, mandatory, longitudinal community engagement and

advocacy curriculum, develop a conference series on social justice topics, and function as a liaison between housestaff and the community. The chief resident also collaborates with non-profit organizations, and actively fosters relationships with community through regular attendance at community meetings. In addition, the chief resident shares clinical, administrative and teaching responsibilities with the other chief residents. The chief resident also delivers a grand rounds to the Department of Medicine on an advocacy or community engagement topic. The chief resident also leads a committee of residents to facilitate and mentor residents in self-directed advocacy projects such as collaboration with local farm programs around health promotion and local providers of diabetes prevention programs. At the end of the 2018-2019 academic year, four individuals will have served in this role.

EVALUATION: The creation of this position has resulted in an expansion of curricular offerings on community engagement and advocacy, including specific knowledge of community-based resources. The chief residents' collaboration with faculty supporting this role has also enhanced the continuity and depth of relationships with community organizations despite the transient nature of residency training.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our residency program has successfully integrated a Chief Resident in Advocacy and Community Health. Through this role, the residency has fostered a deeper understanding of the community which has helped to inform and guide care in the clinic. The position has also provided additional support for residents interested in advocacy, community engagement and social justice.

THE ART OF BALANCE: CARING FOR PHYSICIAN AND PATIENT

Mukta Panda²; Paul Chelminski¹; Angela Dittmar³. ¹University of North Carolina at Chapel Hill, Chapel Hill, NC; ²University of Tennessee, Chattanooga, TN; ³UTC, Chattanooga, TN. (Control ID #3182902)

NEEDS AND OBJECTIVES: Medical students and residents often recite the Hippocratic Oath (or its equivalent) at their white coat ceremonies. Oaths enjoin physicians to care for patients with sincerity, empathy and kindness. Some have suggested that these same values should apply to the physician's self-care as well. That is, repurposing the Hippocratic Oath to emphasize a reciprocal interaction benefiting the servant and the served. Given the alarming prevalence of physician burnout, there is a growing need for resilience training in medical education. Medical education often includes texts in the form of case studies as a way to develop ethical reasoning and diagnostic skills. Building resilience requires similar explicit training. Our work showcases the Hippocratic Oath as a text repurposed to enhance professional wellbeing and undergird ethical and compassionate practice.

SETTING AND PARTICIPANTS: We will share our curriculum, *The Art of Balance: Caring for Physician and Patient*, which is designed to build physician resiliency by emphasizing teamwork, reflection and empathy as catalysts for overcoming physician burnout.

DESCRIPTION: *The Art of Balance: Caring for Physician and Patient* was developed in partnership among The University of Tennessee, Hunter Art Museum Southeast Center for Art Education. There is practical emphasis on developing strategies for overcoming physician burnout. Sessions are comprised of two to three main sections: group engagement and discussion with a work of art; a transitional activity involving individual museum exploration or small group activity; reflective collaboration on a creative prompt. This presentation unpacks a sample session and how the program supports varying needs related to physician burnout.

EVALUATION: This program has served over 150 learners. Each session has a theme but remains organic and responsive to learner needs as they

emerge. Some learners have returned frequently and many remark that their appreciation surpassed their expectations. Qualitative evaluations will be shared.

DISCUSSION / REFLECTION / LESSONS LEARNED: Time to interpret through guided questions has been a success factor of the richness of conversation during discussion. The significance of the relationship between interpreting art and emotional intelligence and been documented. In the *Art of Balance*, individuals develop and refine their emotional intelligence. Students find the experience *de-isolating*, realizing they are not alone in their professional struggles. De-isolation results from conversations catalyzed by observations and reflections on art. Individual interpretations are woven together to become a shared tapestry of thoughts and feelings. This shared construction of meaning lead to empathy. Emergent expression and dialogue is a critical tool in combatting burnout. Loss of autonomy and agency are frequently cited contributors to burnout. Emergent discovery promotes autonomy and agency in a social profession such as medicine.

THE CSI (CLINICAL SCHOLARS IN INFORMATICS): A NOVEL INTERNAL MEDICINE (IM) RESIDENT-DRIVEN APPLIED INFORMATICS PATHWAY

Ajay Dharod^{1, 1}; Hal H. Atkinson^{2, 1}; Gary Rosenthal². ¹Wake Forest School of Medicine, Winston Salem, NC; ²Wake Forest School of Medicine, Winston-Salem, NC. (Control ID #3183877)

NEEDS AND OBJECTIVES: In the changing landscape of healthcare, applied informatics shapes clinical workflows and decision making. It is important to train physicians leaders in applied informatics allowing for novel locally-relevant workflows targeted to improve healthcare effectiveness, efficiency, equity, and patient engagement.

SETTING AND PARTICIPANTS: A single academic medical center, IM residency program. All PGY1 IM residents are eligible. Each year, two PGY1 residents are selected for the pathway to begin their PGY2 year.

DESCRIPTION: The CSI is a two-year applied educational and mentorship pathway for IM residents to develop skills in applied informatics. At residency completion, CSI residents are prepared to tackle most health-system challenges with additional comprehensive understanding of informatics (CDS, workflow, change management, IT systems, EHR, database structures, SQL, regulatory issues, Security/Privacy, etc.). The pathway translates a resident derived project (addressing system pain points) into reality. The presenter will elucidate details of the CSI curriculum, timeline considerations, resources required, budgetary considerations and journal club structure in the presentation (please see online resource URL).

EVALUATION: Of our inaugural class of CSI residents, both completed EHR certification, IRB protocol, workflow analysis, intervention design, baseline data analysis and intervention implementation. One CSI project has been presented at a national meeting. Projects range in scope from predictive analytics to clinical decision support to alert systems to data visualization (please see online resource URL for project details). Of our second class of CSI residents, both are in the design phase. Additionally, we received the following message excerpt from a CSI resident: *"I am blown away by the enthusiasm fellowship programs have shown learning about CSI. They are excited about the skill set of a potential future fellow and are all amazed by the structure of CSI. When I applied for CSI, I had no idea the training received would be this valuable to my career; both now and long-term. Interviewers have been very impressed by the project that we have implemented. Informatics has dominated the conversation in almost all of my interviews."*

DISCUSSION / REFLECTION / LESSONS LEARNED: One resident plans to continue informatics-related work in the Hem-Onc and one resident

plans to join general IM faculty to pursue the practice pathway clinical informatics board certification. CSI has been cited as successful by residents, mentoring faculty, and residency/departmental leadership. We continue to evaluate the impact of CSI projects and draft and disseminate CSI resident-driven innovations. CSI is overall low-cost with \$20,000 in direct costs. Personnel considerations include collaboration with ITS and faculty time. CSI can be leveraged as a residency resident recruitment tool.

ONLINE RESOURCE URL (OPTIONAL): <https://school.wakehealth.edu/Education-and-Training/Residencies-and-Fellowships/Internal-Medicine-Residency/Curriculum-Overview/Clinical-Scholars-in-Informatics-Pathway>

THE DENVER HEALTH LONGITUDINAL INTEGRATED CLERKSHIP (DH-LIC): AN INNOVATION FOSTERING PATIENT-CENTERED ADVOCATES FOR SOCIAL JUSTICE AND HEALTH EQUITY

Jennifer Adams^{1, 2}; Vishnu Kulasekaran¹; Gretchen Guiton²; Kristina Oatis²; jennifer gong². ¹Denver Health, Denver, CO; ²University of Colorado, Aurora, CO. (Control ID #3183687)

NEEDS AND OBJECTIVES: The DH-LIC was established in 2014 to pilot this model at the University of Colorado School of Medicine (CUSOM) and demonstrate feasibility and comparability to rotation based clerkships (RBC). The DH-LIC aimed to increase observation and feedback, create opportunities for meaningful contribution to patient care, and maintain patient-centered values in students. The curriculum focused on social justice and health equity, reinforced by locating this program at an urban safety net hospital with a fully integrated community health system.

SETTING AND PARTICIPANTS: The DH-LIC selects 10 students each year based on their commitment to underserved patients, career aspirations related to health equity, and leadership potential. Students spend one year at DH completing all core clerkships in an LIC model.

DESCRIPTION: LICs share foundational elements of 1) comprehensive care of patients over time, 2) continuous learning relationships with preceptors, and 3) meeting core clinical competencies across multiple disciplines simultaneously. DH-LIC students attain all core clinical competencies expected of CUSOM students and academic achievement has met or exceeded RBC students.

EVALUATION: The DH-LIC has remained the highest rated course at the CUSOM since its inception. Students rate their value as team members, experience with faculty, and ability to impact patient care especially high. Focus groups reveal themes related to the importance of longitudinal relationships with patients, mentorship and role modeling from preceptors, and sustained idealism and commitment to serving vulnerable patients. Post-graduate surveys examine career paths and durability of desire to work with the underserved. 91.3% of DH-LIC graduates report high/very high commitment to working with the underserved and 43.5% plan careers in primary care.

DISCUSSION / REFLECTION / LESSONS LEARNED: Focus groups have led to a deeper understanding of how the DH-LIC model and its curricular focus on social medicine influence attitudes towards caring for vulnerable patients, students' professional identity, and the career paths of student participants. Students are not selected based on an interest in primary care (PC), but chose PC fields disproportionately due to role modeling and ability to follow patients longitudinally. Students who did not choose PC careers or who describe themselves as less likely to work with the underserved described how the DH-LIC experience led them to better understand the care coordination role of primary care and recognize the importance of advocating for disadvantaged patients.

ONLINE RESOURCE URL (OPTIONAL): <http://medschool.ucdenver.edu/dhlc>

THE GIMBOREE EXPERIENCE: STRENGTHENING PRIMARY CARE CAREER INTEREST AND COMMUNITY IN RESIDENCY

Deborah G. Freeland²; Paul O'Rourke¹. ¹Johns Hopkins University, Baltimore, MD; ²Johns Hopkins University School of Medicine, Baltimore, MD. (Control ID #3185885)

NEEDS AND OBJECTIVES: There is a shortage of primary care physicians in the United States, and traditionally internal medicine residency training has focused on inpatient care. To address this growing need, residencies must find ways to emphasize the importance of primary care and support residents who are interested in the fields of general internal medicine (GIM) and geriatrics. We developed a monthly primary care community night for residents and faculty called "GIMboree" with the goal of increasing resident sense of community and interest in primary care careers through a tripartite model: 1) exposure to GIM and geriatrics role models; 2) strengthening medical knowledge related to outpatient medicine through journal club; and 3) fostering a community in which residents feel supported in their outpatient interests.

SETTING AND PARTICIPANTS: We invited Johns Hopkins Bayview Medical Center primary care track residents and GIM/geriatrics faculty to attend voluntary GIMboree events held at either a faculty member's or resident's home. In the first 6 months of implementation (July to December 2018), attendance has ranged from 4 to 8 residents (of 18 total residents) and 2 to 5 faculty per evening.

DESCRIPTION: GIMboree meetings are held monthly and last about 2 hours. The structure includes dinner, primary literature journal article discussion, a faculty member's career story, and time for reflection about GIM clinic. Articles focus on outpatient medicine and were published within the last year. A resident volunteer leads the group through analysis of the evidence, and faculty members volunteer to share their story with prompting questions. Clinic reflection allows residents to obtain feedback about an encounter or to discuss joys and challenges specific to outpatient medicine.

EVALUATION: At each meetings' end, residents and faculty were surveyed with Likert scale and open-ended reflection questions. The short-answer responses were assessed for common themes across meetings and data collection is still ongoing.

DISCUSSION / REFLECTION / LESSONS LEARNED: Preliminary results reveal three main themes from the open-ended reflection questions: excitement about a career in primary care medicine ("Love that you can have a long-term relationship with patients and fulfill a role that no one else is able to for the patient"), growing sense of community ("Having the faculty share joys and difficulties made the community feel tighter"), and goals for self-improvement ("I will be more brave about discussing risks with patients and building a network of colleagues").

THE HIDDEN CURRICULUM: A RESIDENT-LED PILOT PROGRAM TO INCREASE CONFIDENCE AND EXPERTISE IN THE TRANSITION TO CLINICAL PRACTICE

Leah B. Kosyakovsky; Michael Ruiz; Jonah Himelfarb. University of Toronto, Toronto, ON, Canada. (Control ID #3185668)

NEEDS AND OBJECTIVES: The entrance into clinical clerkship is a challenging and intimidating transition. Given the gap between the goals of the preclinical curriculum and the practical skills necessary to begin patient care, this transition presents a challenge unique to this stage of training. In order

to facilitate this new phase of training, we created a resident-led pilot initiative focused on developing the areas often under-represented in the preclinical curriculum. These topics included documentation, medical communication, and applied clinical reasoning.

SETTING AND PARTICIPANTS: This longitudinal program was run as a combination of large and small-group sessions over the course of the academic year. 96 second-year medical students participated in our first session.

DESCRIPTION: Our pilot session involved an interactive case focused on the process of an initial patient assessment and admission. Students completed a pre-survey regarding their confidence in different clinical domains. Students rated their confidence in performing several skills on a scale from 1 (not confident at all) to 5 (very confident). After the session, students completed a similar post-session survey re-assessing their confidence in the taught skills.

EVALUATION: The pre-program survey, completed by 68 students, demonstrated that students had low perceived confidence in several critical skills. In particular, students reported the lowest scores in admitting an inpatient (1.73/5), creating a management plan (1.95/5), and assessing patients in the Emergency Department (2.09/5). After the session, 25 students responded to the post-session survey. 100% of these students reported the session was helpful or very helpful. 96% felt more comfortable documenting an inpatient consultation, 84% felt more comfortable performing an admission, and 96% reported an improvement in their confidence in beginning clerkship.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our study indicates that pre-clerkship students have low confidence in performing several of the critical skills needed in clinical practice. Our program was designed to surmount these gaps through practical, small-group sessions focused on the development of these key competencies. This pilot session demonstrated an improvement in students' confidence in performing and documenting inpatient admissions, as well as allaying fears regarding the transition to clerkship. Further quantitative and qualitative data will be collected throughout future sessions as we continue to shape and refine this preparatory program for clinical practice.

THE HOOFBEATS / COREIM SERIES: PODCASTING AS A PROMISING MEDIUM TO EXPLORE THE LANGUAGE OF CLINICAL PROBLEM-SOLVING.

John I. Hwang^{4, 1}; Shira A. Sachs⁵; Amy Ou³; Shreya P. Trivedi⁴; Martin Fried⁶; Neil Shapiro^{2, 4}; Cindy Fang⁴. ¹Bellevue Hospital Center, New York, NY; ²Dept. Of Veterans Affairs, New York, NY; ³NYU School of Medicine, New York, NY; ⁴New York University, New York, NY; ⁵Weill Cornell Medicine, New York, NY; ⁶Ohio State University Wexner Medical Center, Columbus, OH. (Control ID #3183711)

NEEDS AND OBJECTIVES: Superior clinical reasoning is a hallmark of the expert clinician. However, to a passive listener at a traditional case conference, the process by which this expert arrives at a diagnosis may not be obvious. Discussion often focuses on medical knowledge, rather than on the methods the expert uses to reach a conclusion. Experts vary in their ability to describe how they approach a case, and it is debatable whether narratives produced in this manner are in fact reliable representations of their mental processes. Teaching clinical reasoning can thus be challenging even for experienced faculty. In response, we designed a podcast series using actual cases to explore the conscious and unconscious habits and strategies used by physicians. Our intention was to immerse listeners in the language of clinical problem solving in an accessible and interactive way.

SETTING AND PARTICIPANTS: *Hoofbeats* is one of several series that comprise the CoreIM podcast. It is targeted at trainees and medical professionals across all specialties within internal medicine.

DESCRIPTION: *Hoofbeats* listeners play the role of the clinician, as a difficult case is presented in stepwise fashion with pauses to allow revision of an impression or differential. Listeners hear a discussant work through the case, accompanied by commentary from the show's hosts, who interpret and elaborate on the discussant's reasoning behaviors. Clinical pearls, useful schema, and biases are highlighted. To reinforce the challenge, a visual representation of the case is sent out via social media. In some episodes users can solve an interactive version of the case on the online database HumanDx; the resulting collective differential is then explored within the episode.

EVALUATION: From March to December 2018 we released six *Hoofbeats* episodes, with over 64,000 total downloads by listeners across 170 countries. In our descriptive analysis of feedback, we found that listeners valued the explicit analysis of the problem-solving behavior of experienced clinicians. Interactive elements successfully engaged our listeners, who actively attempted cases and reflected on their reasoning. Through role modeling from the hosts, listeners reported greater confidence articulating and teaching clinical reasoning concepts. Interestingly, commentary on particularly challenging points in a difficult case led our listeners to appreciate the honesty and humility of our hosts and experts, who frequently recognized their own shortcomings.

DISCUSSION / REFLECTION / LESSONS LEARNED: Decades of research into clinical problem-solving have produced a terminology now familiar to many trainees and medical professionals, such as the practice of "problem representation" or the concept of the "availability heuristic." Many of these abstract concepts originated in behavioral science and artificial intelligence programming, and do not lend themselves naturally to book or lecture-based learning. However, our experience with *Hoofbeats* suggests there is significant interest among learners in the practical application of these constructs.

THE HUMAN DIAGNOSIS PROJECT: AN OBJECTIVE, REAL-TIME, AND SCALABLE WAY TO MEASURE CLINICAL REASONING

Marc Rabner; Seiji Hayashi. The Human Diagnosis Project, Washington, DC. (Control ID #3184948)

NEEDS AND OBJECTIVES: Medical errors are the third leading cause of death. Roughly 40,000-80,000 of these deaths stem from errors in diagnosis, and nearly every American will experience a diagnostic error in their lifetime. Despite this magnitude, efforts to reduce medical errors have typically focused on medical treatment and not diagnosis. The largest contributor to diagnostic error is failures of clinical reasoning. Despite the emphasis on the importance of diagnosis and clinical reasoning in medical education today, current approaches to assess and improve clinical reasoning skills are resource intensive and/or subjective, which limit their impact and reach.

SETTING AND PARTICIPANTS: The Human Diagnosis Project (Human Dx) is an online tool for measuring and training clinicians' diagnostic reasoning. Basic access to Human Dx is free and accessible to anyone via a mobile app for iPhone and Android, and on the web at www.humandx.org. Over 15,000 medical professionals and trainees have solved Human Dx's interactive clinical case simulations nearly 250,000 times. Participants are from over 500 institutions, in 80 countries, and from 40 specialties. About 45% are trained in internal medicine. Approximately 30% are attending physicians, 30% are graduate medical trainees, and the remainder are medical students and other health professionals (e. g., NPs, PAs, RNs).

DESCRIPTION: Human Dx has over 3,500 brief, interactive case simulations. Each case is designed to be highly engaging to the practicing physician in order to ensure critical thinking about each case. Cases include clinical information based on a real patient encounter (de-identified) and promote the

evidence-based clinical decision-making found in real patient care. Learners can solve the case simulations in less than 5 minutes and enter their responses in free-text, instead of multiple choice, mimicking real-world practice. Learners' responses are automatically scored by the Human Dx system in real-time - allowing for immediate feedback on learner diagnostic performance.

EVALUATION: A cohort study published in JAMA Open investigated the performance of 1,728 physicians and trainees in over 11,000 Human Dx case simulations. Three measures of Clinical Quotient (CQ), a metric Human Dx uses to estimate clinical competency, were used to assess physicians' diagnostic performance: accuracy, efficiency, and a combined score called the Diagnostic Acumen Precision Performance. The study found that medical professionals with more experience and training demonstrated higher CQ scores on Human Dx case simulations.

DISCUSSION / REFLECTION / LESSONS LEARNED: The Human Diagnosis Project introduces an objective and scalable way to measure diagnostic reasoning. Physicians and trainees anywhere can now use an open, online system to quickly and easily assess and develop their clinical reasoning skills.

ONLINE RESOURCE URL (OPTIONAL): www.humandx.org

THE HUMANISM POCKET TOOL: FINDING THE JOY IN TREATING COMPLEX PATIENTS

Michael Soh¹; Andrew Shaner¹; Lillian Gelberg²; Margi Stuber¹; Kristin Kopelson³; Carole Warde⁴. ¹Greater Los Angeles VA, Los Angeles, CA; ²UCLA, Los Angeles, CA; ³VA, Los Angeles, CA; ⁴Greater Los Angeles VA Health System, North Hills, CA. (Control ID #3186183)

NEEDS AND OBJECTIVES: Your brain is equipped with automatic, emotional responses biased to protect you from people who *might* be dangerous, infectious, or time-consuming. These emotions can sneak up on you and replace compassion with fear, disgust, or anger. Existing practices to counteract these emotions can be time and labor intensive and challenging to implement. The Humanism Pocket Tool (HPT) emphasizes simple yet explicit strategies and techniques designed for providers to promote patient-centeredness by counteracting reflexive, dehumanizing responses to patients with challenging behaviors.

SETTING AND PARTICIPANTS: Our IP practice/training site is in a large VA clinic for homeless Veterans (~3,000 patients). The clinic provides primary care, mental health, and social work services within a patient-centered medical home. To date, we have over 30 trainees and a dozen faculty from five different professions in primary and mental health care.

DESCRIPTION: The HPT pulls from the realms of appreciative inquiry, storytelling, active listening, and mindfulness and integrates intra/interpersonal techniques into common clinical interactions. Via our HPT, clinicians and trainees learn to (1) coach themselves; (2) be warm; (3) listen actively; (4) condense each patient's personal story into a highly compact form, termed a *vivid vignette*; (5) use the Vivid Vignette to identify the patient in progress notes and in conversations with colleagues, so as to inspire and coordinate care; (6) appreciate differing professional perspectives on the patient; and (7) know their team members as people. Each technique builds upon each other to create and enrich the patient's story in order to prioritize their quality of care.

EVALUATION: The HPT is still a work in progress and we intend to learn more about how different teams teach and practice and the various obstacles they run into during patient care. To date, we have over 15 collaborators across the country that have begun piloting the HPT at their respective sites and we've begun a process of reaching out to these providers to learn more about how they utilize the HPT and what can be done to improve it.

DISCUSSION / REFLECTION / LESSONS LEARNED: The HPT has been a product of, and catalyst for, strong collaboration and interdisciplinarity. The *vivid vignette*, a strategy designed to illuminate both the person and their goals, rather than just their problems - has become a fundamental part of case presentations. Additionally, the explicit nature of the HPT has put humanism at the forefront of how our trainees interact with their patients and colleagues and how our clinic culture has defined itself.

THE HYPOTHESIS-DRIVEN PHYSICAL EXAM FOR COMMON INPATIENT PRESENTING SYMPTOMS

Allison Kanakis¹; Deborah DiNardo²; Eliana Bonifacino³; Melissa McNeil¹.

¹University of Pittsburgh Medical Center, Pittsburgh, PA; ²University of Pittsburgh School of Medicine, Pittsburgh, PA; ³UPMC, Pittsburgh, PA. (Control ID #3185516)

NEEDS AND OBJECTIVES: The declining emphasis on the physical exam in medical education and in clinical practice has been widely recognized. More recently, there has been a renewed interest in physical diagnosis as an essential component medical decision-making. As opposed to the complete "head-to-toe" physical exam, the hypothesis-driven physical exam (HDPE) involves predicting and recognizing specific physical exam findings to refine differential diagnoses. However, there is a lack of consensus regarding the essential elements in a HDPE across a spectrum of disease processes and learner levels. We therefore aimed to develop a rubric for assessing the medical student HDPE for common inpatient presenting symptoms.

SETTING AND PARTICIPANTS: We reviewed 248 admission notes submitted by 67 medical students for documentation of the chief complaints. The admission notes were gathered from students rotating on their third year internal medicine clerkship at the University of Pittsburgh Medical Center who submit notes for grading to a faculty facilitator.

DESCRIPTION: We selected the 3 most common chief complaints as presented in the students' admission notes. The 3 most common chief complaints were shortness of breath (32 patients), abdominal pain (23 patients), and chest pain (21 patients). These 3 chief complaints comprised 76 (31%) of submitted admission notes. For each of these 3 selected symptoms, four clinical reasoning experts generated a list of the most common associated diagnoses and the relevant diagnostic physical exam maneuvers based on clinical experience and literature review.

EVALUATION: We created a survey to administer to a group of clinical reasoning and physical diagnosis experts. In the first part of the survey, participants are provided with potential physical exam maneuvers for each symptom and are asked to rank how important each maneuver is to be performed on initial assessment using a Likert scale. In the second part of the survey, participants are asked to identify whether or not an exam maneuver should be performed only if a specific diagnosis is being considered using a dichotomous scale. We plan to conduct a two-round Delphi to establish a consensus list of essential physical exam maneuvers for the HDPE for the 3 selected symptoms. Based on literature review and expert group consensus as described, we will consolidate the list into physical exam maneuvers that (1) should always be performed for a particular presenting symptom and (2) should be done in a hypothesis-driven manner if a specific diagnosis is being considered.

DISCUSSION / REFLECTION / LESSONS LEARNED: By developing a rubric for common inpatient presenting symptoms, the teaching and evaluation of the inpatient HDPE in medical students can be standardized. This tool has the potential to help students learn the pertinence of physical exam findings and enhance their clinical reasoning skills.

THE I-TOPC CASE-BASED CURRICULUM: A NOVEL APPROACH TO TEACHING PRIMARY CARE TOPICS TO INTERPROFESSIONAL LEARNERS.

Timica Campbell¹; Megan McNamara²; Andrew T. Harris³; Elizabeth Painter⁴; Kristina Pascuzzi⁴; Pamela Lynch⁴; Mary A. Dolansky^{5, 4}. ¹Louis Stokes VA Medical Center, Cleveland, OH; ²Louis Stokes Cleveland VAMC, Cleveland, OH; ³Louis Stokes Cleveland VA Medical Center, University Heights, OH; ⁴Louis Stokes Cleveland VA Medical Center, Cleveland, OH; ⁵Case Western Reserve University, Cleveland, OH. (Control ID #3185511)

NEEDS AND OBJECTIVES: Traditional teaching of primary care concepts usually takes a physician-centered approach to diagnosis and management. With the advent of the Patient Centered Medical Home, we recognize the need for teaching cases that model the team-based approach that ideally happens in workplace learning. Currently, there is a paucity of ambulatory curricula that address interprofessional primary care management. Therefore, the objective of the teaching innovation was to develop and implement modules that engage learners in the collaborative nature of primary care.

SETTING AND PARTICIPANTS: The Cleveland VA Medical Center is one of five original Centers of Excellence in Primary Care Education (COE-PCE) established in 2010 with funding from the Veterans Health Administration's Office of Academic Affiliations. The curriculum is an innovative interprofessional program that focuses on training future health care professionals to manage chronic condition. The program includes Medical (MD) residents, Nurse Practitioner (NP) residents, Pharmacy residents, Psychology residents, Social Work and NP students.

DESCRIPTION: A core group of interprofessional faculty from medicine, advanced practice nursing, pharmacy, behavioral health and social work developed and implemented a case-based curriculum that emphasized a team-based approach to primary care topics. In the development of this Interprofessional Transforming Out-patient Care (i-TOPC) case-based curriculum, we used an agreed upon framework and an iterative process to create modules that included interprofessional learning objectives, a content specific case, guiding questions, and a facilitator guide. Examples of topics covered included fibromyalgia, headaches, and dizziness. A team of interprofessional learners were assigned to facilitate the session. Prior to the conference, learners were coached on techniques of presenting to an interprofessional group. Following each case conference, learners were provided with real-time feedback from the core group faculty. At the end of each session all learners were provided with a copy of the facilitator guide.

EVALUATION: After each conference, audience members completed an online evaluation. The evaluation consisted of a combination of Likert-scale questions and short answer questions that rated presentation style, delivery, and the interprofessional nature of the presentation. The average overall rating for the sessions was 4.69 on a 5-point scale. Examples of some of the short answer feedback include: "Fantastic! Love the new i-TOPC format." "No better way [to present information]!"

DISCUSSION / REFLECTION / LESSONS LEARNED: Over the course of the development and implementation of i-TOPC cases, we learned that maintaining a small, core group of faculty members was key. After identifying the core group, we solidified into an efficient and committed team. We also recognized the utility of interprofessional faculty members attending case presentations to facilitate discussion, gauge case effectiveness and for future case improvement.

THE INPATIENT ACADEMIC HALF DAY; THE WHYS AND HOWS IN A LARGE MULTI-SITE PROGRAM THAT USES AN X+Y SCHEDULING SYSTEM

Jasmyn Miller¹; Roberto O. Diaz Del Carpio²; Scott Guarin³; Regina Makdissi⁴. ¹Jacobs School of Medicine and Biomedical Sciences at University at Buffalo, Niagara Falls, NY; ²University at Buffalo, Buffalo, NY; ³Jacobs School of Medicine and Biomedical Sciences, Buffalo, NY; ⁴State University of New York at Buffalo, Buffalo, NY. (Control ID #3185127)

NEEDS AND OBJECTIVES: Delivering high quality conferences at 3 sites is challenging given the lack of standardization, difficulty finding speakers, and video broadcasted conferences felt impersonal and passive. Daily clinical work prevents active trainee participation with the lack of true protected time for meaningful education. Objectives: 1. To increase the quality of inpatient educational teaching sessions. 2. Provide the trainees with high quality, evidence-based content to use during their clinical rotations within a protected educational time. 3. To enhance camaraderie and teamwork amongst all trainees. 4. To increase trainee satisfaction with their educational activities. Create a venue where trainees are accountable for their active learning and can interact with their core faculty in an encouraging, judgment free environment.

SETTING AND PARTICIPANTS: A large multi-site (3 major teaching hospitals) with 4+1 scheduling.

DESCRIPTION: Sessions are topic guided: We based the objectives on the Society of Hospital Medicine Curriculum. One separate half day for the residents and interns: 1st Hour: Case discussion with questions to be researched and presented by the trainees next conference day 2nd Hour: Topic review with board-review questions at the end to test for retention. 3rd Hour: Evidence-based medicine presentation by trainees.

EVALUATION: We surveyed 23 Academic Hospitalists prior to implementation, 50% rated the noontime conferences as average or below average, 50% did not know. Trainee surveys by ACGME and our Wellness Committee showed overall poor satisfaction with their education and poor professional satisfaction with noontime conference. Focus group discussions identified the lack of protected time, constant interruptions for calls from the nursing staff, and the lack of active learning as major limitations to their education. This redesign is part of a trainee-led initiative supported by the Back to Bedside Grant awarded by the ACGME. After implementation, we administered ABIM style quizzes and brief evaluations of the conferences quarterly. We also administered a follow up wellness survey in June 2018. Thirty six trainees completed these questions with an overwhelmingly positive response to the new academic half day. Close to 90% of trainees looked forward to the academic half day with the remaining percent neutral. Over 85% agreed that the new half day was better than the previous noontime conferences. A high majority of trainees believed the topics were tailored to their education level/needs, were satisfied with the topics and length of presentation. A high majority also disagreed that having team members leave for the academic half day negatively affected patient care.

DISCUSSION / REFLECTION / LESSONS LEARNED: Major changes require anticipation, culture change and buy-in from all parties. It requires careful planning to find the balance between patient care and education where neither is compromised. Reaching out to other programs to learn from them was an important part of our planning.

THE MASTER CLINICIAN'S ELECTIVE: INTEGRATING EVIDENCE-BASED PHYSICAL EXAMINATION (EBPE) AND POINT OF CARE ULTRASONOGRAPHY (POCUS) IN MODERN CLINICAL MEDICINE

Maria G. Frank¹; Cason Pierce²; Noelle Northcutt³; Joseph W. keach⁴; Gerard Salame¹; Rebecca Allyn⁵. ¹Denver Health Hospital Authority, Denver, CO; ²Denver Health, Denver, CO; ³Denver Health, Aurora, CO; ⁴Denver Health Medical Center, University of Colorado School of Medicine, Denver, CO; ⁵Denver Health Medical Center, Denver, CO. (Control ID #3186385)

NEEDS AND OBJECTIVES: The program aims to create a reproducible elective that combines physical exam and bedside ultrasound as a method of improving resident skills in these techniques. The objectives for learners include: understand the utility and evidence behind physical exam maneuvers, exhibit the ability to execute an EBPE, confirm or challenge clinical diagnosis by skillfully performing POCUS and utilize POCUS to increase the success and safety of medical bedside procedures.

SETTING AND PARTICIPANTS: Our program is offered as an elective rotation at an academic, safety-net hospital in Denver, CO. The course is open to up to six senior Internal Medicine residents per year. Since inception, 9 residents have participated and over 20 are currently on the waitlist for the elective this year.

DESCRIPTION: The two-week curriculum has been offered since 2016 and combines teaching EBPE skills and POCUS. Six faculty members (four for physical exam and two for POCUS) from the division of Hospital Medicine teach the course. Faculty rely upon published literature to determine the highest yield exam maneuvers and bedside ultrasound techniques for establishing commonly encountered diagnoses. Additionally the limited diagnostic value of certain commonly performed exam maneuvers is highlighted. Teaching is done in interactive, small group sessions. To ensure integration, each instructional day provides morning physical exam teaching and afternoon ultrasound training sessions which are focused on a common theme. Enrollment is capped to optimize the trainee to attending ratio.

EVALUATION: Residents perform a practical pre-test and a post-test under direct observation by course faculty. Each resident is measured on the ability to perform pre-determined EBPE maneuvers and POCUS skills. Thus far, in the pre-test, participants have correctly performed an average of 40% of expected physical exam maneuvers and 32% of expected POCUS skills. At the conclusion of the elective, all participants have been able to effectively demonstrate 100% of the highest yield physical exam and ultrasound maneuvers.

DISCUSSION / REFLECTION / LESSONS LEARNED: In the era of high value care, we believe it is imperative for all practitioners to master EBPE and POCUS. Trained faculty and ultrasound resources are limited. While our elective is a collaboration of 4 exam-focused and 2 POCUS providers, it could be run with as few as 1 of each with enrollment limited to four participants. Challenges encountered include faculty availability due to competing clinical duties, accessibility of bedside ultrasound technology and faculty with a level of expertise to teach bedside ultrasound applications.

THE OTHER SBP - TEACHING RESIDENTS FUNDAMENTALS OF NAVIGATING COMPLEX CLINIC AND COMMUNITY SYSTEMS VIA A SYSTEMS BASED PRACTICE CURRICULUM

Arash Nafisi; Sahar Soleymani. Olive View - UCLA Medical Center, Encino, CA. (Control ID #3184765)

NEEDS AND OBJECTIVES: Medical education in residency programs has often consisted of curriculum that primarily emphasizes traditional medical knowledge, such as the medical treatment of diabetes and obesity. However,

the changing nature of medicine has required physicians to become increasingly familiar with coordinating patient care within larger health care systems. Thus, it is more important than ever that programs highlight Systems Based Practice as a core competency to emphasize an interdisciplinary approach to chronic disease management and to teach residents how to effectively navigate clinic and community resources for treatment chronic disease and addressing underlying social determinants that impact patient health.

SETTING AND PARTICIPANTS: We developed an outpatient Systems Based Practice (SBP) curriculum for interns in our internal medicine residency program at Olive View - UCLA Medical Center, a safety-net hospital in Los Angeles that cares for vulnerable, underserved patients.

DESCRIPTION: Our yearlong curriculum begins during orientation, where the concept of SBP is defined, key members of the Patient-Centered Medical Home team are introduced and their roles are reviewed. Subsequent sessions occur at the start of each outpatient block for all 10 blocks during intern year. The curriculum is presented in small groups by clinic faculty and includes topics such as inbox management, clinic/community resources and Quality Improvement. Sessions are interactive and often include guest presenters such as social workers (SW), community health workers (CHW) and dietitians.

EVALUATION: To evaluate the effectiveness of this curriculum, we developed a survey that was administered to interns before and after our intervention. We found that at the end of the intervention, interns subjectively reported significantly increased confidence in their ability to navigate system complexities ($p < 0.01$) and utilize both clinic and community resources to help meet patient needs ($p < 0.001$). Residents were also objectively found to navigate clinic and community systems significantly better, correctly identifying resources for alcohol use disorders ($p < 0.001$), food and transportation insecurity ($p < 0.001$), behavioral health ($p = 0.002$) and referrals to community health workers ($p < 0.001$).

DISCUSSION / REFLECTION / LESSONS LEARNED: We have developed an SBP curriculum to emphasize the importance of effectively navigating clinic and community resources for treatment of prevalent chronic diseases. After our intervention, interns subjectively reported increased confidence in navigating the system and objectively demonstrated significant gains in understanding and utilizing clinic and community resources to provide optimal care for patients. We also found that interns were more engaged when guest speakers were present. Though we do not have a comparison group, we believe this format has been effective in highlighting this core competency; we plan to continue adapting our SBP curriculum to engage our learners and teach them how to advocate for patients in our community.

THE ROLE OF NARRATIVE MEDICINE AS A MEANS OF REFLECTION AMONG INTERNAL MEDICINE INTERNS

Louisa W. Whitesides; Meredith McAdams; Sheila Quinn; Farah Hussain. Hospital of the University of Pennsylvania, Philadelphia, PA. (Control ID #3184568)

NEEDS AND OBJECTIVES: Narrative Medicine (NM) is an activity shown to have positive effects on the emotional and professional development of healthcare professionals and has even been shown to decrease burnout. Yet, few sustainable curricula have been developed for residency-level trainees. This study integrates a longitudinal NM curriculum during intern year of an internal medicine residency program with aims to explore its role in fostering empathy and social connectedness among interns. Objective 1: to determine the feasibility and acceptability of incorporating a pilot NM curriculum into existing learning modules for internal medicine (IM) interns. Objective 2: to explore the role of NM in the development of empathy and social connectedness among IM interns.

SETTING AND PARTICIPANTS: Each intern participated in a total of 3 one-hour NM sessions embedded in protected didactic time during outpatient blocks over 6 months. Sessions included approximately 12-15 IM interns and were facilitated by a project leader. Forty-four total interns participated in the curriculum.

DESCRIPTION: Each session focused on 2-3 different pieces of media selected by the investigators (prose, poetry, visual art, or video clips). Interns were provided with the excerpts one at a time. Each excerpt was read or viewed together and followed by a group discussion of salient themes. Interns spent 5-7 minutes writing in response to a prompt. Participants then shared their writing in small groups. Each session focused on a different theme or perspective, for example, the transition from student to intern; characteristics of a "good" doctor; the Inner Critic vs Inner Coach.

EVALUATION: Participants completed an evaluation form after each session. Semi-structured in-depth Interviews are underway to study NM's role in empathy and social connectedness among interns.

DISCUSSION / REFLECTION / LESSONS LEARNED: This curriculum was easily integrated into the intern didactic plan, demonstrating feasibility. Forty-four interns rated the overall quality of the sessions with a mean score of 4.4/5 on a Likert scale of (1) *not at all useful* to (5) *extremely useful*. Interestingly, writing was considered to be the least useful component of the session (3.9/5), while group discussion was considered to be the most useful (4.5/5). Although this is a relatively small sample in a single setting, preliminary findings suggest that protected time for reflection and discussion among peers is an effective method of processing the challenging experiences in medical training. Reflective writing may also be useful, but preliminarily appears to be a less favorable method. We aim to further understand this concept in the qualitative portion of our study, which is currently underway.

THE TOPSY-TURVY AND WONDERFUL WORLD OF FLIPPED CLASSROOMS. UTILIZING FLIPPED CLASSROOMS IN THE INTERNAL MEDICINE CLERKSHIP AS A CURRICULAR INTEGRATION TOOL

Sherine Salib¹; Beth Nelson². ¹Dell Medical School, University of Texas at Austin, Austin, TX; ²Dell Medical School at UT Austin, Austin, TX. (Control ID #3168241)

NEEDS AND OBJECTIVES: Curricular integration of pre-clerkship and clinical material can be challenging. We review one tool that we have found to be effective in facilitating this.

SETTING AND PARTICIPANTS: At Dell Medical School, students follow a non-traditional 4 year curriculum, entering the clerkship year in the second year (MS2) after an accelerated one year pre-clerkship (MS1) curriculum. The MS1 curriculum actively uses problem based learning and interactive large group learning. Students take the USMLE step 1 exam at the end of the second year with an average of five weeks of dedicated study time.

DESCRIPTION: All core clerkships were charged by the Curriculum Committee to incorporate active learning techniques into the clerkship didactics. During our 8-week Internal Medicine Clerkship, we utilize an interactive, case-based "flipped classroom" model to both highlight high-yield clinical curricular components, as well as vertically integrate material from the pre-clerkship and clinical years. Clinician-educators, several of whom have experience teaching in both settings, help lead these sessions. To make the flipped classrooms effective, students review pre-class material, including the systems-related items from the pre-clerkship year. Additionally, faculty who facilitate these classrooms incorporate questions and cases that help students integrate learning from the pre-clerkship and longitudinal courses such as interprofessional education, population health, and social determinates of health.

EVALUATION: Our data indicates very good student evaluations of these sessions. For the academic year 2017-2018, the flipped classroom sessions received an overall score of 4.7 out of 5.0, compared to a score of 3.9 out of 5.0 from the prior year when a more traditional didactic set-up was utilized. Students' mean equated percent correct score on the Medicine NBME exam was 74.9, which is within one point of the national mean, further supporting that there is certainly no harm in the flipped classroom model. Additionally, our early experience with curricular integration, of which these flipped classrooms are just one tool amongst many others utilized in other courses, has resulted in robust step 1 scores. Every member of the 2017-2018 student cohort earned a passing score on the USMLE Step 1 exam, with a mean score of 244.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our data support better student outcomes in both satisfaction and board exam performance, demonstrating that our students have excelled in this curricular model. Embedding an intentional integration model to align learning goals from the pre-clerkship and clinical years, in the form of flipped classrooms, is one tool which may help achieve this. Traditional faculty believe they must instruct students in everything they need to learn, whereas in the flipped classroom there is an assumption of trusting our learners to come prepared, taking responsibility for their learning. Ongoing faculty development, as well as robust communication between the various courses are imperative for the success of this model.

TRAINING HEALTH PROFESSIONALS TO BE INSTRUCTORS OF INTERPROFESSIONAL PRACTICE: A NOVEL APPROACH

Rachel Jantea; Victoria Hornyak; Cassandra Leighton; Teresa Pacella; Rosemary Hoffmann; Sandra Engberg; Susan Meyer; Subashan Perera; Benjamin Reynolds; David M. Elnicki; Debra K. Weiner; Alton E. James; Rollin M. Wright. University of Pittsburgh, Pittsburgh, PA. (Control ID #3175044)

NEEDS AND OBJECTIVES: Interprofessional (IP) collaborative practice is essential for older adults with complex medical problems and improves health outcomes. Interprofessional education (IPE) is required for students across the health professions, but many preceptors remain untrained in IP practice and instruction. After formal needs assessment, we designed an integrated IP practice + IPE instructor skills training to prepare preceptors to teach IPE competencies to health profession students in the clinical setting.

SETTING AND PARTICIPANTS: Ten health professionals (5 nurse, 2 physical therapy, 2 occupational therapy, 1 speech therapy) at a major academic medical center neurotrauma unit [designated the Interprofessional Dedicated Education Unit (IPDEU)] were trained as IPE instructors in Jul-Aug 2018.

DESCRIPTION: IPE Instructor training focused on IP practice skills and IPE-specific instructor skills. IP practice training included 1) a 1-hour web-based skills module based on the 2016 Interprofessional Education Collaborative Core Competencies, and 2) a 2-hour simulated physician colleague interaction for IP skill practice. IPE-specific instructor training included 1) a 1-hour web-based module emphasizing skills to facilitate active IPE-directed observation by students, and 2) a 2-hour simulated IP student interaction for instructor skill practice.

EVALUATION: We measured pre-post change in IP practice and instructor knowledge (multiple-choice test), IP attitudes [Interprofessional Collaborative Competency Attainment Scale (ICCAS) & Assessment for Collaborative Environments (ACE15)], and IP practice/instructor skills (simulation skill checklists). Composite scores for each measure were analyzed using paired t-tests. Nine participants had complete data. ICCAS & ACE15 scores increased after training (diff 7.8, $p=0.011$; 12.2, $p=0.049$, respectively). Both IP

practice and IP instructor skill use increased after training, with a greater increase in instructor skills (diff 1.86, $p=0.0626$; 2.99, $p=0.026$, respectively). Knowledge test scores were unchanged.

DISCUSSION / REFLECTION / LESSONS LEARNED: All measures improved after training, with the exception of knowledge test scores, which were unchanged. Improvement in IPE instructor skills suggests IPE-specific teaching is a new skill that improves with training. Baseline self-rated IP competencies (ICCAS) were higher than was reflected in baseline skill use, indicating a discrepancy between confidence and competence. Both self-rated IP competencies and skill use improved with training. The training was feasible for this small sample. Next steps include evaluation of student outcomes and implementation on a larger scale.

TRAINING MEDICAL RESIDENTS TO BE PHYSICIAN ADVOCATES IN IMMIGRATION DETENTION HEALTH

Chanelle Diaz¹; Tanuja Devaraj¹; Robyn Winsor¹; Nathaniel Kratz¹; Lauren Quijano²; Shruthi Rajashekara³; Matthew Anderson¹. ¹Montefiore Medical Center, Bronx, NY; ²New York Lawyers for Public Interest, New York, NY; ³Baylor College of Medicine, Houston, TX. (Control ID #3184927)

NEEDS AND OBJECTIVES: Every day U.S. Immigration and Customs Enforcement (ICE) detains over 40,000 people in detention facilities where substandard medical care has resulted in poor health outcomes and in-custody deaths. Medical providers can play an important role in advocating for the release of detained immigrants by partnering with lawyers to document health inequities in detention facilities. Medical residents developed a pilot community-based track focused on immigration detention health advocacy. The objectives of this track were to: 1. Train residents in medical advocacy on behalf of individuals who need medical attention and are at risk of deportation. 2. Expose residents to the realities of mass deportation and its impact on community health. 3. Empower residents to use their voices in public spaces to advocate for immigrant rights.

SETTING AND PARTICIPANTS: Third-year medical residents in a primary care residency program in Bronx, NY. In-person medical assessments took place at local detention facilities under the supervision of an attending physician. Visits to detention facilities were facilitated through an existing immigration-focused community-medical-legal partnership.

DESCRIPTION: Four residents participated in the pilot track, consisting of approximately six half-day sessions. Residents were required to complete a training workshop that provided knowledge and skills in the medical evaluation of individuals in immigration detention, standards of care in detention, unique health needs and barriers to care, and writing affidavits. Residents were expected to complete 1-2 evaluations, either through review of medical records alone or in-person assessment depending on the nature of the request made to us by our legal partners. Based on these evaluations, residents wrote medical affidavits that lawyers used to advocate for the individual's release or access to needed medical care. Residents also met with community-based legal and advocacy organizations that work with individuals at risk of deportation. Completion of an additional advocacy project was optional.

EVALUATION: There are 10 third-year primary care residents; 4 listed the immigration detention health track as their first choice out of 4 options. Four listed it as their second choice. Participating residents completed a 2-hour training workshop. A total of 9 medical evaluations were completed (1-3 per resident). Residents visited 3 community-based organizations (75% attendance), and rotated at a community-based clinic that serves undocumented minors and families, including families who were separated at the border. One resident published an opinion editorial on medical neglect in immigration detention as an advocacy project.

DISCUSSION / REFLECTION / LESSONS LEARNED: We report the successful launch of a residency track to develop physician advocates with skills in immigration detention health. Residents gained an in-depth understanding of mass deportation as a public health issue, as well as the impact of immigration status on the mental and physical health of individuals.

TRAINING PROVIDERS FOR THE FUTURE: INTERDISCIPLINARY CARE OF CHRONIC PAIN AND OPIOID MANAGEMENT IN THE AGE OF TELEHEALTH

Rachel Wong; Patricia Ng; Tracey Spinnato; Kimberly Noel; Erin Dainer; Mark Lerman; Amit Kaushal; Alice Fernan. Stony Brook University School of Medicine, Stony Brook, NY. (Control ID #3160786)

NEEDS AND OBJECTIVES: Patients with chronic pain, who have a high rate of anxiety and depression, are challenging to manage in primary care. Given the complex biopsychosocial nature of chronic pain, we need to train physicians to provide interdisciplinary care using tools such as telehealth to reduce barriers to care. Our aim is to create and implement an interdisciplinary, longitudinal simulation which integrates team-based telehealth care of complex patients with chronic pain. We will develop metrics for evaluation of residents in synchronous and asynchronous communication skills with patients and relevant specialties. We also aim to study the effect of this interdisciplinary telehealth simulation on the knowledge, attitudes and self-reported behaviors of residents in caring for patients with complex chronic pain.

SETTING AND PARTICIPANTS: The training will be offered to 56 PGY1 and PGY3 Internal Medicine residents at a university-based program in Stony Brook, NY during the 2018-19 academic year.

DESCRIPTION: We developed a longitudinal, 5-week simulation with 1) a virtual tele-visit Observed Standardized Clinical Evaluation (OSCE) with a patient with chronic pain, opioid use and comorbid psychiatric disease, 2) post-visit asynchronous care of the patient using electronic messaging between nursing, social work and subspecialty consultants to manage clinical deterioration and 3) a virtual, interdisciplinary tele-conference to discuss patient care and decision-making.

EVALUATION: Resident knowledge and attitudes regarding telehealth will be measured using pre- and post-simulation surveys. Resident skills will be evaluated through assessment of 1) standardized patient checklists during tele-visit patient encounters, 2) post-visit written electronic consultation and communication between residents with specialists and patients 3) a post tele-conference message from the resident to the patient that summarizes and conveys tele-conference recommendations for management.

DISCUSSION / REFLECTION / LESSONS LEARNED: The educational simulation will be implemented from February to April 2019, with plan for data analysis and reporting in May 2019.

TRAINING THE FUTURE GENERATION OF PRIMARY CARE

Nautam Ganatra, Michael E DeBakey VA Medical Center, Houston, TX. (Control ID #3186099)

NEEDS AND OBJECTIVES: The estimated shortage of primary care physicians will be between 8,700 - 43,100 by 2030. Primary care residency positions are increasing less rapidly than other positions. Lower reimbursements are often cited as the reason for shortage of primary care physicians. ACGME requires 130 half days of continuity clinic during 3 years of residency, which is less than half a day a week. Majority of training during the residency is focused towards the hospital medicine, and subspecialties. Residents' continuity with their patients and preceptors is challenging concept.

It can improve the educational experience in ambulatory care and may lead to more trainees to choose primary care as their career choices.

SETTING AND PARTICIPANTS: Presented here are the findings from the academic primary care practice at the New Orleans VA. The practice comprised of four academic internists, who supervised more than 80 residents across all PGY levels, from Tulane University School of Medicine. They were dedicated to the teaching and precepting 8 half days week, and 2 half days week they were provided with administrative time, with 3300 veterans assigned. Non-academic providers had combined 9400 veterans. They were scheduled for 9 half days of direct patient care, and one half a day of administrative time.

DESCRIPTION: Continuity rate for the residents with their patients in academic clinic were compared to the national average. Diabetes and Hypertension outcomes were compared to the non-academic veterans' panel at the New Orleans VA. This comparison was made during the first four months of second half of the academic year.

EVALUATION: During the year 2017, from January to April, continuity with residents was between 56-59% at our site, while national average during the same time for residents' continuity was between 43-45%. HTN : BP > 150/90 mm of Hg; (goal < 15%) [Jan 2017- April 2017] - (Lower The Better) - EPRP review The % of patients who had inadequate BP control were higher in resident clinic at 19.4%, while non academic teams had 17.5% of patient with poor BP control. Chi square = 0.0213, p value = 0.999 Diabetes: % A1c > 9 Or Not Done: [Jan 2017- April 2017] - (Lower The Better) - EPRP Review The % of poorly controlled DM were better in academic continuity team, 21.30%; compared to non-academic teams combined, at New Orleans VA were 23.30%. z score = 3.2944, p value = 0.001 Diabetes: % DM - BP < 140/90, goal 75 % or more [aggregate: Jan 2017- April 2017] - EPRP Review BP control in patients with DM, academic continuity team were at 76.70%, compared to non-academic teams combined at New Orleans VA were 74.90%. z score = 6.9783, p value = 0.00001

DISCUSSION / REFLECTION / LESSONS LEARNED: This observational data shows better performance of academic clinic in Diabetes care. Hypertension control were better in non academic teams in diabetic patients. In non diabetics, there were better trends in non academic teams. Despite having better than average continuity experience for the residents, the quality metrics outcomes are inconsistent in academic primary care settings.

TRUST ME, I'M AN INTERNAL MEDICINE DOCTOR - A COLLABORATIVE PROCESS TO DEVELOP SPECIALTY-SPECIFIC EPAS

Shanu Gupta¹; Kevin E. O'Brien¹; Kellee Oller¹; Robert Ledford¹; Cuc Mai²; Deborah DeWaay¹. ¹University of South Florida, St Petersburg, FL; ²USF, Tampa, FL. (Control ID #3184954)

NEEDS AND OBJECTIVES: Since the early 2000s, the medical education community has developed competency-based education to identify the professional roles of a physician in training. Measuring competency requires several steps: identification of tasks, implementation of curricular activities to teach these tasks, and development of measurement tools to determine competence. The AAMC has packaged tasks into generalizable EPAs. Little is known about what evidence GME programs would need to agree with a UME program's decision of entrustment. At our institution, we sought to foster a closer alliance between UME and GME in developing EPAs that deliver an entrusted professional ready to take on specialty-specific tasks at the start of Internal Medicine residency. Our objectives were to: 1. Identify Internal Medicine specific Entrustable Professional Activities (EPA) 2. Develop a process for implementing, assessing and evaluating an innovative EPA-based curriculum

SETTING AND PARTICIPANTS: The primary stakeholders in the development process were Internal Medicine Clerkship Directors, the Acting Internship Director, the residency Program Directors and the Chair of Internal Medicine.

DESCRIPTION: Ten percent (10%) faculty effort was procured to develop EPAs. Department chairs committed to invest in upstream efforts because 20% of our medical students matriculate into our residencies. Currently, 4th year learners participate in a specialty-specific curriculum. The internal medicine faculty champion worked in partnership with department, clerkship and residency program leadership to describe specialty-specific EPAs using the AMEE EPA guide. Each IM EPA was mapped to AAMC EPAs and core competencies. Assessments for entrustment were interwoven into 4th year track requirements.

EVALUATION: The first year goal is to assign the EPA lead, establish joint meetings with clerkship and program directors, and identifying specialty specific UME EPAs for competency assessment. The 3-5 year goal is to develop a specialty specific EPA program that would be cited on the students' MSPE.

DISCUSSION / REFLECTION / LESSONS LEARNED: We are challenging the idea that all graduating medical students should be general practitioners. This EPA-based curriculum is specialty specific - a strength and a weakness. We gained stakeholder buy-in as 20% of graduates remain at our institution. For our learners the link between medical school and their specific experience on July 1 is clearer. Although this pilot represents a small cohort, a focused skill set improves feasibility. Institution specificity may reduce generalizability. The collaborative process of developing EPAs opens a channel for true educational continuity. Moving entrustment from a theoretical model to a pragmatic curricular blueprint is a paradigm shift for most clinician educators. We anticipate the need for faculty training in establishing a frame of reference for entrustment in Internal Medicine.

TWITTER REPORT: A NOVEL APPROACH FOR TEACHING CLINICAL REASONING ON SOCIAL MEDIA

Casey N. McQuade¹; Michael G. Simonson¹; Kristen A. Ehrenberger^{1, 2}; Amar Kohli². ¹University of Pittsburgh Medical Center, Pittsburgh, PA; ²UPMC, Mars, PA. (Control ID #3178107)

NEEDS AND OBJECTIVES: Social media is increasingly popular for disseminating educational material to busy trainees. Resident report-style learning is particularly valuable, but cases take 30-60 minutes to conduct. We adapted report-style, case-based teaching into an asynchronous format using the Twitter social media platform.

SETTING AND PARTICIPANTS: We developed a Twitter profile, @MedEdPGH, starting in February 2018 to disseminate educational material. Unconditional email invitations were sent to Internal Medicine residents (n=200) and faculty (n=165) at our institution to encourage participation. The profile was viewable by any Twitter user, including those not at our institution.

DESCRIPTION: Each Friday, the authors posted a brief clinical vignette followed by the question, "What else do you want to know?" to the @MedEdPGH profile. Twitter users responded to the post asking for additional details, and the authors replied in real-time. Participants were asked to explain their clinical reasoning, when applicable, and the authors emphasized clinical reasoning pearls in reply. The authors moderated the discussion so all pertinent aspects of the case were explored, including eliciting summary statements and a differential diagnosis. After the correct answer was elucidated, the case was concluded with relevant teaching points. Online engagement was assessed using Twitter Analytics. Resident

and faculty attitudes after 6 months were assessed at our institution using a post-intervention survey instrument.

EVALUATION: Over the 6-month intervention period, the 11 Twitter Report cases were viewed 21,845 times and were engaged by users 1,773 times. A total of 86 Twitter profiles spanning 22 U.S. states and 6 countries contributed to Twitter Report discussions. Participants from all training levels were present, including faculty. The most common clinical reasoning topics discussed were cognitive biases, test characteristics, and diagnostic frameworks. Moderators required 30-90 minutes of total screen-time spaced over a 24-48 hour period to lead each discussion. Of 86 trainees who responded to the post-intervention survey, 22 (15 residents, 7 faculty) reported interacting with Twitter Report. 15 of 22 respondents at least somewhat agreed that participation in Twitter Report increased their clinical reasoning skills. 16 of 22 at least somewhat agreed that Twitter Report increased their clinical knowledge.

DISCUSSION / REFLECTION / LESSONS LEARNED: Twitter Report is effective for engaging learners of all levels in a clinical reasoning discussion on social media. It reached a global audience using a case-based format. Participants reported favorable effects on their clinical reasoning and knowledge. The intervention required time and effort similar to in-person report-style teaching, but the asynchronous format allowed time commitments to be distributed favorably throughout the day for busy trainees and educators. Future iterations will leverage the multimedia capabilities of social media to further illustrate clinical reasoning teaching points.

ONLINE RESOURCE URL (OPTIONAL): <https://twitter.com/MedEdPGH>

UCONN IMMIGRATION RIGHTS INITIATIVE: THE DEVELOPMENT OF A STUDENT RUN ASYLUM CLINIC AND AN AVENUE FOR REFUGEE ADVOCACY

susan levine. University of Connecticut, Farmington, CT. (Control ID #3175910)

NEEDS AND OBJECTIVES: There are over 68 million individuals displaced globally due to human rights abuses. Of these 262,000 applied for asylum in the United States in 2016. As the caps for refugee resettlement continue to diminish and the criteria for asylum status become more restrictive, it is increasingly important that physicians become trained to advocate for this vulnerable population. An individual's likelihood of successfully attaining asylum increases from 38 to 89% when an affidavit incorporates a trained medical or psychiatric forensic evaluation. A student run asylum clinic is a way to provide critical medical testimony, to teach trainees essential clinical skills for recognizing signs of abuse, and to advocate for vulnerable populations.

SETTING AND PARTICIPANTS: The UConn Immigration Rights initiative is the advocacy arm of a 3 part entity, UConn Immigrant Health. UConn Immigrant Health also includes a faculty run refugee and Immigrant Health clinic as well as a medical student and resident curriculum in refugee health. The UConn Immigration Rights Initiative is a student run asylum clinic wherein medical student trained by Physicians for Human Rights (PHR) perform pro bono forensic evaluations for attorneys representing clients seeking asylum. In addition to providing forensic affidavits, students work directly with community partners to advocate on a wide variety of immigrant and refugee issues. Students apply the advocacy skills they learn within their medical school community.

DESCRIPTION: The asylum clinic is a collaboration between UConn Law school, PHR and UConn Health. Medical students and supervising faculty attend PHR training which reviews: legal aspects of asylum,

conduct of an evaluation for physical and psychological symptoms of torture in order to correlate consistency between symptoms and abuse allegations, as well as drafting of an affidavit based on the Istanbul protocol. Student follow cases through to their adjudication, attending case hearings. Student leadership roles in the clinic include executive director, director of education, director of outreach, director of asylum services and board of advisors. Student meetings review pending and upcoming cases, plan community events and provide educational updates in a mini journal club format.

EVALUATION: Asylum affidavit drafts are submitted to PHR for review and then revised with the attorney. Ultimately the success of this clinic will be determined by case records. To date our 2nd case is awaiting hearing. Our first case resulted in asylum being granted.

DISCUSSION / REFLECTION / LESSONS LEARNED: UConn is one of a small number of medical schools in the country with a student run asylum clinic. What is particularly unique is the integration of this clinic with the education and clinical care components of UConn Immigrant health. Thru this integration students learn first hand the power of advocacy and contextualize learning to care for a particularly vulnerable population.

UNTANGLING INPATIENT CARE FROM POLICING: TRAINING TO ADDRESS CARING FOR HOSPITALIZED PATIENTS IN CUSTODY

Jo Henderson-Frost; John Weems; Rachel Simon. Massachusetts General Hospital, Newton, MA. (Control ID #3186318)

NEEDS AND OBJECTIVES: Patients who are unable to fully communicate his or her clinical or social history due to fear of legal repercussions, stigmatization or threats may receive inferior medical care, despite best intentions of providers. Typical medical education includes discussion of HIPAA and patient privacy, but not necessarily clinical examination of patients in custody and maintenance of patient confidentiality in the presence of correctional officers. We have observed challenges providing confidential medical care in the presence of the correctional officers. We aim to develop and disseminate a training module to educate staff on clinical care and the rights of detained patients.

SETTING AND PARTICIPANTS: To best formulate the training, we are evaluating baseline knowledge, attitudes and practices of resident physicians in internal medicine and emergency medicine at Massachusetts General Hospital. We chose this population because physicians in the emergency room and the internal medicine wards are the most likely to care for hospitalized patients in custody.

DESCRIPTION: In an online survey, participants will be asked about their knowledge on the privacy rights of hospitalized patients in custody by the Department of Corrections; their attitudes toward caring for patients in custody; and their observations of comparative clinical practice in the care of patients in and not in custody. The survey results will be used to develop a training to be offered to all internal medicine and emergency medicine residents physicians.

EVALUATION: In the preliminary phase to design the survey, we asked a smaller group of residents to describe their interactions with correctional officers. In these anecdotes, officers were sometimes asked to step outside of the patient's room and on other occasions remain present during the clinical encounter. With this survey, we will evaluate the knowledge of providers, e.g. does HIPAA applies equally to all patients, to design the content of the training module. We will also evaluate attitudes to address fears and concerns, and experience to design a training that addresses current practices in our hospital. An evaluation of the training module will

be subsequently designed with a comparison of pre- and post- knowledge, attitudes and practices.

DISCUSSION / REFLECTION / LESSONS LEARNED: To our knowledge, there are no published studies that evaluate providers' knowledge, attitudes towards and preparation to care for hospitalized patients in custody. This survey evaluates if and how care of patients in custody differs from those not in custody from the perspective of the provider. The survey results will directly inform design of our training module. Participation in this study may also provide space for residents to reflect on their care for patients in custody, particularly if and how the presence of law enforcement personnel in the patient room affects the care they provide.

USE OF SIMULATION TO IMPROVE RESIDENT CONFIDENCE DURING RESPONSE TO IN-HOSPITAL CARDIAC ARREST

Razia Jayman-Aristide¹; Sadia Arshad¹; craig hertz²; Erica Beauplan¹.

¹Southside Hospital, Bay Shore, NY; ²Northwell Health, Lake Success, NY. (Control ID #3184913)

NEEDS AND OBJECTIVES: In-hospital cardiac arrests (IHCA) occur about 200,000 times per year in the United States with an 18-20% survival rate. While resident physicians are expected to competently lead an IHCA code team, restrictions on residency duty hours decreases exposure to IHCA. Research suggests that simulation improves resident confidence, communication and quality of care during IHCA through deliberate practice in a supportive learning environment. The objective of this study is to evaluate the effect of IHCA simulations on residents' perceived confidence in assuming critical code team roles as well as their perception of the effectiveness of the multidisciplinary code team.

SETTING AND PARTICIPANTS: Six IHCA simulations were conducted over a four-month period on medical floors from January to April 2018. Family medicine residents responded as they would during actual codes as a part of their inpatient service curriculum. Faculty physicians observed the event, giving immediate feedback via a debriefing. Anonymous confidence surveys were sent to residents prior to and after the intervention. Respondents to Simulations included: On Call Residents, Nurses, & Respiratory Therapists

DESCRIPTION: Simulations were developed in one of two ways - from ACLS (Advanced cardiac life support) protocol scenarios or from true occurrences within the hospital. ACLS protocols such as identifying ventricular tachycardia vs. ventricular fibrillation, identifying PEA (pulseless electrical activity), and various other arrhythmias were the focus of a portion of the simulations. 'True occurrences' within the hospital were used as reflective teaching during simulations.

EVALUATION: Surveys were created using Qualtrics software. A link to surveys was sent to the residents to complete over two-weeks. Pre- and post-intervention data were calculated by Qualtrics. PGY-1s felt most comfortable in their "assumed" role as a compressor. Only 25% of PGY-3 respondents felt comfortable as a team leader. The remaining 75% felt somewhat comfortable. Approximately 56% of the PGY-2 respondents felt uncomfortable in the role of a team leader, whereas 33% felt somewhat comfortable. Post-intervention, across all years of training, overall comfort in every role increased. PGY-1 and PGY-3 residents felt more comfort as team leader, ventilator and medication administrator. PGY-1 residents felt no difference as a defibrillator. PGY-2's noted less overall comfort as the team leader, medication administrator or defibrillator with an unchanged comfort level as the ventilator.

DISCUSSION / REFLECTION / LESSONS LEARNED: Simulation can help address residents' perceived lack of confidence, comfort and

knowledge in IHCA responses. In this study, it was noted that residents do not feel comfortable assuming the role as team leader. This poses a significant implication in an inpatient setting where residents are in fact expected to be able to lead code blue scenarios. This lack of comfort in assuming the role of a leader can ultimately affect performance during real-time scenarios

USING A GROUP OBSERVED STANDARDIZED CLINICAL EXPERIENCE (GOSE) TO TEACH MOTIVATIONAL INTERVIEWING

Barbara Porter¹; Kelly J. Crotty²; Sarah J. Moore³; Joanna Dognin⁴; Margaret Horlick⁴. ¹NYU SOM, New York, NY; ²New York University, NY, NY; ³NYU School of Medicine, New York, NY; ⁴NY Harbor VA Healthcare Center, Brooklyn, NY. (Control ID #3185304)

NEEDS AND OBJECTIVES: Didactic training in motivation interviewing (MI) lacks efficacy, because opportunities to practice skills while being directly observed are rare. The goal of our educational innovation was to train interns in the advanced communication skills of motivation interviewing through a group observed standardized clinical experience (GOSCE). Our learning objectives were as follows: After an experiential learning session on MI, interns will be able to: 1. Identify opportunities to use MI with patients 2. Recognize "change talk" from a patient as an opportunity to use MI techniques 3. Use MI techniques when discussing behavior change with a patient

SETTING AND PARTICIPANTS: 46 internal medicine interns in an academic internal medicine residency program.

DESCRIPTION: Each session began with a 20 minute review of MI for behavior change given by a psychologist trained in Motivational Interviewing. Then, interns participated in a 3 station, one-hour long Group Observed Standardized Clinical Exercise (GOSCE). Interns worked in teams of 3, and for each station, one of the 3 interns was the active physician, while the other 2 observed the encounter. Each intern had an opportunity to be the active physician for a case. Each case was observed by one or two faculty members, one of whom was a psychologist trained in MI. After a 10 minute interaction with the standardized patient, the active physician received feedback on their MI skills and debriefed the encounter with the faculty and their peers. After the 3 cases, the session concluded with a group debrief and summary of the experience. Interns completed a retrospective pre/post survey to assess the impact of the session.

EVALUATION: Residents reported statistically significant improvement in all domains, including confidence with identifying opportunities to use MI, comfort using reflective and summary statements during MI, and likelihood of using motivational interviewing in future patient encounters. Qualitative comments after the session reflect that residents developed an appreciation for silence as a tool during MI, felt comfortable with tools such as decisional balance, and recognized the value of patient centeredness during MI.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our inter-professional educational team (psychologists and internists) provided different perspective for both learners and our internal medicine faculty. Our residents appreciated practicing skills and receiving feedback in real time. This academic year (one year after the intern GOSCE), these same learners will participate in an OSCE that includes a case requiring motivational interviewing skills, and we will evaluate the durability of motivation interviewing skills taught during this session. We are interested in expanding opportunities to use GOSCE as a low stakes skills practice and development tool.

USING OBJECTIVE STRUCTURED TEACHING ENCOUNTERS (OSTES) TO PREPARE RESIDENTS FOR CLINICAL TEACHING ON THE WARDS

Jacob H. Johnson¹; Madeleine Matthiesen^{2, 2}; Zoë Gottlieb²; Caitlin N. Li²; Arielle Medford²; Nilay Patel²; Anna K. Rubin²; Ariel Frey-Vogel²; Kerri Palamara². ¹Brigham and Women's Hospital, Boston, MA; ²Massachusetts General Hospital, Boston, MA. (Control ID #3183724)

NEEDS AND OBJECTIVES: Education of peers, students, and health professionals is an important role for residents during their graduate medical training. However, formal methods to improve trainees' clinical teaching are lacking. An Objective Structured Teaching Encounter (OSTE) is a simulated scenario in which participants teach scripted standardized trainees (actors). We previously developed a realistic and accurate 4-case OSTE for summative assessment of resident clinical teaching. This project's objective is to adapt the OSTEs for formative assessment by adding in structured debriefs after each case with the goal of improving clinical teaching.

SETTING AND PARTICIPANTS: Medicine and pediatric residents who lead clinical teams were invited to participate. Multiple sessions were offered in 2017-2018.

DESCRIPTION: The OSTE curriculum contains four cases: Teaching on Rounds, Teaching at the Bedside, Giving a Chalk Talk, and Giving Feedback on an HPI. Cases have up to 3 actors to simulate clinical teaching. The clinical content was adapted based on specialty. A 1-page debrief guide was developed for each case based on a literature review and iteratively updated based on expert opinion. Faculty and actors received 15 minutes of training. For each case, the resident read the prompt and then taught for 8 minutes followed by a 10 minute debrief with the faculty observer and actor(s). The 4-case session lasted 80 minutes.

EVALUATION: Forty-four residents participated, 21 in medicine and 23 in pediatrics; 22 as resident teachers and 32 as actors (10 as both). 12 faculty participated as debriefers. Teachers, faculty, and actors completed surveys with a 97% response rate. All residents who participated as a teacher would recommend the session. On a 5-point Likert scale, with higher score indicating more agreement, all residents agreed or strongly agreed they felt more prepared to teach on the wards (mean 4.48), and all felt the debrief was helpful (mean 4.61). Teaching take-aways included, "Asking more probing questions to fully assess knowledge" and "Pause longer for answers." Residents cited "Hearing immediate feedback with people we know well" and "Great feedback from actors" as the most effective portion of the OSTE. 97% of actors agreed or strongly agreed that they learned new teaching skills (mean 4.64) and remarked, "liked participating in the debrief—great way to learn from juniors/attendings/fellow actors" and "Helpful to see the different learners' approaches." All actors felt prepared to portray their part. All faculty, teachers, and actors agreed or strongly agreed that the cases were reflective of actual teaching scenarios. One faculty member noted, "[this case] is realistic and can be taken in so many directions that it captures many of the elements which cause learners and teachers angst."

DISCUSSION / REFLECTION / LESSONS LEARNED: Our 80-minute 4-station OSTE with faculty and actor-led debrief was well-received, feasible and an efficient way to train clinical teachers. Nearly all residents who participated, regardless of role, reported improving their teaching.

USING THE MEDIAN NERVE AS A MODEL FOR INTRODUCING BASIC PRINCIPLES OF POINT OF CARE ULTRASOUND IN INTERNAL MEDICINE RESIDENT EDUCATION

Rita Poon¹; Christopher T. Kelly¹; Claudia L. Campos². ¹Wake Forest University School of Medicine, Winston Salem, NC; ²Wake Forest University, Winston-Salem, NC. (Control ID #3167769)

NEEDS AND OBJECTIVES: The structure and content of POCUS curricula in outpatient internal medicine (IM) have not been standardized and are understudied. We conducted a novel hands-on model for an introduction to ambulatory POCUS education during IM residency training. Ultrasound (US) evaluation of the median nerve to diagnose carpal tunnel syndrome may be a promising alternative to nerve conduction studies (LR 5.87). The educational objectives for the session were 1/ to successfully locate and measure the median nerve at the wrist 2/ demonstrate principles of US knobology.

SETTING AND PARTICIPANTS: 18 Internal Medicine residents (PG1-3) at Wake Forest Baptist Medical Center in Winston-Salem, NC participated in an introductory POCUS workshop in a classroom environment during noon conference

DESCRIPTION: A 30-minute hands-on POCUS workshop was conducted. Overview of basic US concepts and the median nerve anatomy at the wrist was reviewed in a brief introductory PowerPoint presentation. Residents were then divided into 4 small groups (4-5 participants) with 1 facilitator and 1 POCUS machine in each group. Only the main instructor was proficient in identifying the median nerve. Residents took turns finding the median nerve on each other, while adjusting the gain and depth to obtain an ideal image for measurement.

EVALUATION: The facilitator in each group observed residents using the US and assessed their ability to identify the median nerve, acquire an adequate image, and perform measurements. Residents also completed a survey at the end of the session. By the end of the workshop, 18/18 residents were able to visualize and measure the median nerve. All 18 residents were able to successfully choose the correct transducer, and adjust focus, depth, and gain. All residents either agreed or strongly agreed that this workshop was effective in acquiring basic US principles and gain a better understanding of knobology.

DISCUSSION / REFLECTION / LESSONS LEARNED: Using the median nerve at the wrist is an easy and effective hands-on model to teach basic US principles. Following the recommendations from the Consensus on a Canadian Internal Medicine US Curriculum (2014), examination of the median nerve 1/ was selected on basis of clinical or educational need, 2/was feasible (both cognitive and technical components of the curriculum could be reasonably taught and learned in a competency-based manner while minimizing potential risks to patients); 3/was evidence-based. The exam is quick and eliminates the need for standardized patients or simulation models. Instructors do not need prior training in neuro-US.

UTILIZATION OF QUICK RESPONSE FEEDBACK TOOL TO IDENTIFY EARLY STRUGGLING INTERNS AND PROMOTE SUPERVISING RESIDENT COACHING

Rita Poon; Adam R. Schertz; Jessica Hollingsworth; George Waits; Andrew Dothard; Hal H. Atkinson; Donna Williams. Wake Forest School of Medicine, Winston-Salem, NC. (Control ID #3179018)

NEEDS AND OBJECTIVES: Early identification of struggling interns during internal medicine (IM) residency training is difficult, yet critical. Late identification limits opportunities for early intervention and remediation. Formal evaluations are limited by the length and relative rarity of administration. Supervising residents (SR) are an untapped resource for identifying and assisting struggling interns in real time. Here, we describe the implementation of a tool administered weekly utilizing Quick Response (QR) codes for SR evaluation of interns. This tool was adapted from Loyola University IM Residency Program. We aimed to identify struggling interns, and promote SR coaching in areas of concern.

SETTING AND PARTICIPANTS: The QR feedback tool (QR-FT) was administered weekly by chief residents (CR) to SRs rotating on ward services

from July 2018 through January 2019. The survey included 11 specific questions about the following areas of intern performance: efficiency, organization, communication, professionalism, and mental health. Evaluatees consist of 45 interns, (33 categorical, 12 preliminary). Non-IM interns were excluded. Evaluators consist of senior IM residents who answered "yes" or "no" to each question in the survey where "yes" always indicated a concern.

DESCRIPTION: SR accessed the survey on Google Forms by using their smartphones to scan a QR code brought to the workroom by the CR weekly. The SR spent ~5 minute per intern on the following tasks: 1) complete tool, 2) explain concerns, 3) receive feedback on how to coach. The CR followed up on each intern's progress next week with the same survey. If an intern had 2 or more concerns for 2 or more consecutive weeks, they were identified as struggling, and the CR began coaching that intern.

EVALUATION: 13 of 45 interns were evaluated each week via the QR-FT yielding a total of 194 responses. 41 interns were evaluated total, with a mean of 4 evaluations each. Concerns were raised on 63.4% of interns (n=26). Feedback was not provided in 28 of 66 responses (44%) when a concern was identified. The most common concern related to efficiency: "Has the intern stayed past 6 pm to finish notes?" (46.3%, n=19 interns), and concern was resolved with a mean time of 2.29 weeks. 9 interns were identified as struggling learners via implementation of this tool, as compared to 0 interns identified by the formal evaluations.

DISCUSSION / REFLECTION / LESSONS LEARNED: The QR-FT identified struggling interns, and showed that SR provided feedback half of the time when a concern was identified. These findings indicate that the tool is feasible, timely, and effective in identifying early concerns and represents a platform to improve coaching of struggling interns. Future directions include measuring SR and intern attitudes toward this tool and ensuring SR follow-through on suggested coaching.

VALUE-ADDED MEDICAL EDUCATION THROUGH STUDENT DOCUMENTATION: ADOPTING THE CMS RULE CHANGE IN THE MEDICINE SUB-INTERNSHIP

Avni Bavishi3; Jennifer Bierman3; Kathryn Hufmeyer1; Celia O'Brien3; Michael Angarone2; Heather Heiman3. 1Northwestern, Chicago, IL; 2Northwestern University Feinberg School of Medicine, Chicago, IL; 3Northwestern University Feinberg School of Medicine, Chicago, IL. (Control ID #3183130)

NEEDS AND OBJECTIVES: Medical students desire meaningful clinical roles, and educators have advocated "value-added" medical education, in which health systems benefit from the presence of learners. In 2018, The Center for Medicare and Medicaid Services (CMS) revised rules to allow students, with appropriate supervision, to document billable notes for patient encounters. We aimed to determine whether students' perception of their notes' value and of their supervisors' engagement and feedback would change after implementation of the rules.

SETTING AND PARTICIPANTS: Our primary teaching hospital adopted the revised CMS rules in July 2018. In December 2018, we surveyed 48 fourth-year students who completed their medicine sub-internship during the two months before (group 1) and two months after (group 2) the rules were adopted.

DESCRIPTION: Leaders from education, compliance, legal, and information systems developed a hospital-wide policy and workflow permitting billable student documentation of supervised encounters. Students were advised about the change and the intended workflow. Faculty and residents were asked to apply the new policy to medicine sub-intern notes and were provided language for adding student notes.

EVALUATION: Surveys included 6 structured-response items rated on a Likert scale (1=never, 5=always) and one open-ended item. Forty-five of 48 students (93%) responded; we evaluated the 35 students placed at the primary teaching hospital. Group 2 sub-interns (n=18) reported that their notes more often served as the team note for their patient (mean 3.9 vs 1.9, p<.001), were valuable to the work of the team (mean 3.9 vs 2.7, p=.01), and were read by attendings (mean 4.0 vs. 3.2, p=.02) when compared with group 1 sub-interns (n=17). Group 2 sub-interns also reported more frequent resident note review and more feedback from residents and attendings; these changes were not statistically significant. Group 2 sub-interns whose notes usually/always served as the team note (n=11) reported significant increases in all outcomes except attending feedback compared with group 1 sub-interns (n=12) whose notes were rarely/never used as the team note.

DISCUSSION / REFLECTION / LESSONS LEARNED: After implementation of the CMS documentation rule change in the sub-internship, students reported significantly higher perceived value of their notes. We demonstrated trends toward improved feedback, though they did not reach significance in the primary analysis of this small cohort. Our findings suggest that permitting students to take on this clinical role may enhance learning of documentation, a critical entrustable professional activity.

WELLNESS WEDNESDAYS AND MORE: BUILDING A WELLNESS CURRICULUM THAT FOSTERS WELL-BEING AND COMBATS BURNOUT

Megan A. McGervey¹; Susan Vehar¹; Cory Chevalier¹; Jennifer Ramsey¹; Abby Spencer². 1Cleveland Clinic Foundation, Lakewood, OH; 2Cleveland Clinic, Chagrin Falls, OH. (Control ID #3181399)

NEEDS AND OBJECTIVES: In an era where physicians experience high rates of depression, burnout, and suicide, it is imperative that training programs support residents using an interdisciplinary approach to foster connection, build coping strategies, and enhance resilience as we work towards systemic change that supports resident well-being. Our objectives were to create change that fosters well-being through leadership roles and scheduling changes, creating learning objectives to educate residents on components of well-being and recognizing burnout, and providing resources to promote a culture of wellness.

SETTING AND PARTICIPANTS: This innovation takes place at a large tertiary care academic medical center that hosts 181 internal medicine residents. All residents receive protected learning time for the wellness curriculum during the longitudinal clinic week using the 4+1 block scheduling model and during the lecture series delivered at noon conference.

DESCRIPTION: The infrastructure for our wellness curriculum was built with the appointment of a Director of Wellness and Well-being and schedule restructure using the 4+1 model in order to promote work-life balance that includes protected time for sessions that focus on caring for the caregiver. During this Y week model, residents receive protected learning time with a focus on forming relationships, recognizing burnout, and addresses issues specific to physicians in today's age. The curriculum uses a multi-faceted approach targeting the different domains of physical, emotional, social, and professional wellbeing. This has included access to free gym memberships, resident PCP appointments, development of community building activities, weekly "Wellness Wednesday" walk round activities, sessions on nutrition, social media support, resident-led wellness interest groups, and increased awareness and normalization of free caregiver therapy and hospital resources utilizing holistic medicine. It includes resident-led "Wellness Groups" featuring opportunities for food-based gatherings, joint runs, cooking classes, movie nights, camping trips, and plans for a talent show this upcoming spring.

EVALUATION: Surveys were sent to 181 residents indicating that Wellness Walk Rounds and Wellness Wednesday emails have been overwhelmingly popular and are extremely effective means for distribution of upcoming events and resources that promote well-being. Prior to the intervention, few residents were aware of the "Caring for Caregivers" free therapy sessions or free gym memberships. Wellness groups have been created and have grown in size and expanded to 10 different domains. Thus far, metrics for recognition or prevention of burnout have been less effective.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our current initiatives have opened the door to conversation and the potential for collaboration with other residency programs who are interested in this directorship. We are currently creating a tool to assess for burnout during advisor meetings that can be used to focus on residents particularly at risk.

WHAT CAN I DO ABOUT IT?: A PRACTICE-ORIENTED ADVOCACY CURRICULUM FOR INTERNAL MEDICINE RESIDENTS

Priscilla Wang; Ayrenne Adams; Zoe Tseng. Brigham and Women's Hospital, Brookline, MA. (Control ID #3186381)

NEEDS AND OBJECTIVES: The critical role of social determinants in affecting health has been well-documented. However, the majority of internal medicine residency training focuses on teaching biologic disease interventions, as opposed to addressing social determinants of health. Brigham and Women's internal medicine residents reported via survey interest in advocating for patients, but hesitancy to do so due to limited experience and lack of awareness of how clinicians can create systems-level change. The primary objective of our curriculum is to enable internal medicine trainees to graduate residency equipped with foundational knowledge and skills necessary to advocate for patients in all settings, whether in the clinic or a legislator's office. Secondary objectives include teaching self-advocacy as a means of advancing health equity, and increasing resident interest in participating in advocacy during residency and after training.

SETTING AND PARTICIPANTS: Primary care PGY-1 and PGY-2 cohorts at Brigham and Women's Hospital (15 individuals)

DESCRIPTION: We designed a peer-led advocacy curriculum grounded in adult learning theory with active participation. Scheduled during ambulatory blocks, each session features (1) a brief didactic component, (2) interactive breakouts and (3) a group activity to build an advocacy toolkit session-by-session (e.g. targeted electronic medical record "SmartPhrases"). Sessions include: (1) Structural competency as framework to address health inequity (2) Legislative advocacy (3) Self- and patient-advocacy in clinical settings (4) "Hill Day": residents interface with state legislators

EVALUATION: The PGY-2 cohort completed a pre-survey prior to the curriculum, followed by post-session feedback forms. Pre and post-responses were matched and compared using anonymous personal identifiers. The pre-survey revealed that 85% of participants did not feel that they possessed concrete skills to use for advocacy and 85% were not comfortable in engaging in legislative advocacy. Themes in post-survey written and verbal feedback included appreciation of interactive sessions and the focus on practical applications, and clear recognition of skill-building during sessions. Post-curriculum survey data and PGY-1 data will similarly be analyzed following completion of scheduled sessions.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our curriculum has preliminarily demonstrated that a small number of concise, practice-based sessions can increase resident comfort with engaging in advocacy and likelihood of participating in advocacy in the future.

WHAT CAN PHYSICIANS DO?: BUILDING AN ADVOCACY CURRICULUM FOR FIRST-YEAR MEDICAL STUDENTS

Elizabeth P. Griffiths¹; Arianne Teherani¹; Megha Garg². ¹UCSF, San Francisco, CA; ²San Francisco VA Medical Center, University of California San Francisco, San Francisco, CA. (Control ID #3181665)

NEEDS AND OBJECTIVES: The role of physicians as advocates is increasingly recognized. However, most medical students still receive little to no training on advocacy skills. Prior exit surveys of University of California, San Francisco (UCSF) medical students indicate that students feel unprepared to engage in advocacy activities. Our objective was to develop and evaluate a novel advocacy curriculum for first-year medical students.

SETTING AND PARTICIPANTS: In 2016, UCSF School of Medicine launched a course in which first-year students explore the social and behavioral sciences. Our new advocacy curriculum was delivered to all first-year medical students beginning in 2016-17, then modified for the 2017-18 year.

DESCRIPTION: The new small group session on physician advocacy in 2016-17 included an advocacy debate and opinion writing practice. Based on student feedback, in 2017-18 the session was revised to include a written reflection and discussion of physicians' roles as advocates rather than a debate, and a legislative advocacy role play was added. Discussion included a focus on the level at which students plan to be involved as advocates—on behalf of individual patients, to improve the health system in which they work, and/or for policy change at the county, state, or national level.

EVALUATION: In the 2017-18 year, quantitative data was collected via a matched pre- and post-curriculum survey. Forty-five students (32%) completed both surveys. We found no significant change in students' views on the importance of advocacy (4.36 vs 4.36 on a 5 point Likert scale, p = 1.00) or their likelihood of advocacy as future practicing physicians (4.22 vs 4.24, p = 0.74). We did find a significant increase in their likelihood of advocacy as medical students (4.00 vs 4.20, p = 0.02) and their confidence in their ability to advocate (3.58 vs 3.89, p = 0.01). We also found that 87% of students plan to be involved in advocacy beyond the individual patient level (i.e. health system level or beyond) and 58% plan to be involved in advocacy beyond the health system level (i.e. county, state, or national level).

DISCUSSION / REFLECTION / LESSONS LEARNED: A two-hour small group session on physician advocacy showed significant increases in students' likelihood of involvement in advocacy and their confidence in their ability to advocate. This data is limited by response rate and proximity to the session. We plan to complete qualitative analysis of students' reflections on physician advocacy and repeat surveys as students near completion of medical school to better understand students' views on advocacy, as well as how these views change over the course of training.

WITH HER: WOMEN'S HEALTH EDUCATION FOR INTERNAL MEDICINE RESIDENTS. FIRST YEAR RESULTS FOR AN INNOVATIVE 3-YEAR LONGITUDINAL CURRICULUM

Patricia Ng¹; Kimberly A. Kranz². ¹Stony Brook University School of Medicine, Port Jefferson Station, NY; ²Stony Brook University School of Medicine, Stony Brook, NY. (Control ID #3160590)

NEEDS AND OBJECTIVES: Recent studies surveying Internal Medicine Program Directors identified women's health to be an essential education topic, but there is limited data about structured women's health curricula for programs who use X+Y block schedules. Our program's needs assessment revealed that the majority of our residents were unsatisfied with our current women's health curricula and were not confident in managing core women's health topics. Our study aims to develop and assess a longitudinal women's

health curriculum that includes interactive workshops using the "Jigsaw Method" (a cooperative learning strategy where peers are responsible for teaching specific content in teams) and a women's preventive health clinic (WPHC) to improve Internal Medicine residents' knowledge, confidence, and skills in addressing core women's health topics.

SETTING AND PARTICIPANTS: Our curriculum was delivered to 84 categorical residents at a university-based Internal Medicine program in Stony Brook, NY. We implemented only the workshop portion of our curriculum during the first year.

DESCRIPTION: We delivered a 2-hour weekly "jigsaw" workshop over 5 ambulatory blocks, which focused on menopause, osteoporosis, urinary incontinence, and abnormal uterine bleeding. In the Jigsaw Method, residents divide into teams of 4, their "home base group," and each member is assigned to become an "expert" in 1 of the 4 workshop topics. To become "experts," teams split up to join peers who were given the same assignment and these groups will review readings together. Eventually residents return to their home base group to peer teach their topic and apply their collective expertise to solve patient cases. To review answers, teams compete in a gameshow quiz which allowed facilitators to reinforce main teaching points.

EVALUATION: Participants completed a pre-test and post-test immediately before and after the workshop, and a follow-up survey at the end of the academic year. Surveys included knowledge and confidence questions, and feedback questions about the curriculum. Seventy-four residents (88.1%) completed the pre-test, 62 (73.8%) completed the post-test and 53 (63.1%) completed the follow-up survey. At post-test, mean knowledge scores increased from 51.3% to 69.2% (p<0.0001) and the majority (94.6%) were "very satisfied/satisfied" with the workshop. End of the year results showed less improvement in knowledge scores but there was significant improvement in the confidence of managing menopause, hormone replacement therapy, and urinary incontinence (p<0.05).

DISCUSSION / REFLECTION / LESSONS LEARNED: Our preliminary results suggest that workshops using the Jigsaw Method may be an effective technique to increase Internal Medicine residents' knowledge and confidence in women's health, but repetition is needed to enhance retention. We plan to continue to develop and assess this longitudinal curriculum and implement the WPHC.

ONLINE RESOURCE URL (OPTIONAL): www.jigsaw.org; www.kahoot.com

WOMEN IN MEDICINE MENTORING AND EMPOWERMENT TRAINING PROGRAM: A NEEDS ASSESSMENT AND INTERVENTION IN PROGRESS

Amanda Simone¹; Melissa Simone²; Lauren Block³; Nancy A. LaVine⁴.

¹Northwell Health, Flushing, NY; ²University of Minnesota, Minneapolis, MN; ³Northwell Health, Lake Success, NY; ⁴Northwell Health, New Hyde Park, NY. (Control ID #3184965)

NEEDS AND OBJECTIVES: Women face unique challenges throughout their careers as physicians, including disparities in salary and leadership positions. Interventions to address these issues have been made at the faculty level, however little has been done to address the same challenges for female residents. This is concerning, as many decisions determining career trajectory take place during residency. Thus, we conducted a needs assessment on gender in the workplace to establish a mentoring and empowerment training program to support female residents.

SETTING AND PARTICIPANTS: A needs assessment survey was distributed amongst female internal medicine residents within the Northwell

Health System. There residents were also the participants in our focus group and ongoing training program.

DESCRIPTION: A targeted needs assessment, a combination of 3 validated surveys on workplace/gender culture, burnout and empowerment was sent to female residents. Surveys were sent to 60 female residents, and to date we have a 30% response rate. Preliminary results show that 69% of respondents felt that women had fewer opportunities for professional development at work than men, 69% felt that men receive more organizational support than women, and 87% stated they would like to receive more support in the workplace. Data collection still is ongoing. These early results reveal an opportunity to provide support and professional development to our female trainees. A focus group of five female trainees identified a need for a "safe-space" to discuss issues specific to being female residents. Participants identified desired topics, including negotiation, leading an effective team, work-life integration, public speaking, self-advocacy and addressing microaggressions and gender bias in the workplace. Based on this preliminary data, we developed a 6-session mentoring and empowerment training program for female internal medicine residents. Each session includes a learner-centered workshop on a topic from the focus group, and time for mentoring. Sessions are held at the hospital after working hours for ease of attendance.

EVALUATION: Three workshops have been held, with attendance ranging from 5-15 participants. Pre- and post-workshop surveys focused on perceived knowledge and comfort with topics covered will be given at each session, the results of which are forthcoming. The needs assessment survey will be repeated at the end of the year to reassess participant's sense of support and opportunity for career advancement.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our needs assessment shows a need amongst female residents for a place to receive support and career training. Our program provides a learner-centered, innovative way to provide this. Variability in attendance is attributed to variable resident schedules, and we plan to optimize schedules to enhance attendance going forward.

YES WE CAN! A SELF-MANAGEMENT CURRICULUM TEACHING PATIENT SELF-EFFICACY CAN IMPACT PATIENT OUTCOMES IN A RESOURCE POOR, UNDERSERVED ACADEMIC PRIMARY CARE SETTING.

Stacie Schmidt¹; Erica Sheline². ¹Emory University, Atlanta, GA; ²Emory University School of Medicine, Atlanta, GA. (Control ID #3183009)

NEEDS AND OBJECTIVES: 1. Outline an experiential curriculum for medical students to teach patient self-management skills 2. Enhance learner confidence and satisfaction in helping patients set behavioral health goals. 3. Demonstrate that student-administered health coaching can improve patient clinical and behavioral health outcomes.

SETTING AND PARTICIPANTS: Our academic, safety net, hospital-based clinic provides care to uninsured patients with multiple chronic illnesses. To address barriers that underserved patients face towards adopting healthier nutrition habits, our clinic provides weekly Healthy Living Group Classes. These interactive nutrition and behavior based classes are taught by medical student volunteers who also spend class time facilitating patient goal setting.

DESCRIPTION: The Healthy Living class curriculum is continually modified by patient feedback and has been reviewed by nutritionists. Students review the class syllabus outlining topics and educational discussion points for each session. Volunteer students also work with patients via telephone to set, assess, and reframe (if necessary) self-management goals every 1-2 weeks.

EVALUATION: In 2017-2018, more than thirty medical students voluntarily delivered health coaching to patients via weekly group classes or individualized telephone health coaching. Likert-scale survey results show high learner satisfaction; reflections submitted by student volunteers disclose impactful experiences and a deep understanding of barriers patients face in accessing health care. The tele-health coaching pilot (mean duration 4.6 months) conducted by phone involved 27 patients, with 4 patients dropping out. Changes in patient behaviors (goal attainment, medication adherence, and show rates to appointments) as well as patient systolic blood pressures improved during that time period. Preliminary data from 26 patients who attended more than one Healthy Living class between October 2017-September 2018 showed that 73% of patients lost weight. Of those who lost weight, 10 patients (52%) lost over 5 lbs each.

DISCUSSION / REFLECTION / LESSONS LEARNED: Experience-based models may improve medical student confidence in teaching patient self-management skills. Such interventions demonstrate positive clinical outcomes and improved health behaviors for small samples of patients. Our intervention has several limitations including small sample size, no control group, and selection bias as students participate voluntarily.

YOU CAN DO IT: USING A MI CURRICULUM TO ENHANCE STUDENT LEARNING, ENGAGE PATIENTS, AND PROMOTE HEALTHY BEHAVIORS

Chavon Onumah; Mihir Patel; Matthew Mintz; Namarik Alenezy. George Washington University, Washington, DC. (Control ID #3184287)

NEEDS AND OBJECTIVES: Describe the fundamental principles, steps, and techniques of Motivational Interviewing. Demonstrate core skills of Motivational Interviewing. Apply Motivational Interviewing skills for health promotion in the clinical setting.

SETTING AND PARTICIPANTS: The curricular initiative was implemented as a core requirement for all clinical clerkship students at a single medical school (N=155).

DESCRIPTION: Using Kolb's Experiential Learning Cycle as a Model, a 4-part MI curriculum, "Promoting Healthy Behaviors," was implemented in our longitudinal primary care clerkship to enhance learning in motivational interviewing. The curriculum includes self-directed learning, small-group exercises, standardized patient practice, AND a real-life clinical intervention (medication adherence, lifestyle modification, or substance cessation) with patient follow-up and reflection.

EVALUATION: Students completed anonymous surveys regarding their learning experience with the project, their respective patient's goal progress at the time of follow-up, and feedback on the project. Data was analyzed via quantitative and qualitative methods. Three faculty members coded qualitative responses independently through open coding. Disagreement was resolved by discussion and data recoded by a final coding scheme. The authors discussed the coded data to arrive at a final set of themes.

DISCUSSION / REFLECTION / LESSONS LEARNED: Rich reflections were collected through the student evaluations and the following themes across the knowledge, skills, and attitude learning domains emerged: *Meeting patients "where they are at" on the Stages of Change scale is key in promoting change. Behavioral change is difficult and takes considerable support and follow-up. Incremental changes, tapping into internal motivation, and addressing barriers aid in success. Motivational interviewing is an impactful way to promote healthy behaviors and important skill to learn.* 78% of patients reported progress towards their self-directed health behavioral change goal established in the student-led MI encounter at 4 to 6 weeks post-encounter. Over half of students agreed that

the project helped them learn to effectively counsel patients using a patient-centered approach. Lessons learned: Patient follow-up after the initial MI encounter enhanced learning and contributed greatly to the transformative process but was also a barrier for some students. Students appreciate earlier exposure and expanded opportunities to utilize and receive feedback on MI skills. Conclusion: The Promoting Healthy Behaviors project is an effective method of enhancing multi-dimensional medical student learning in motivational interviewing and engaging patients in behavior change and health promotion. A clinical intervention with follow-up helped students appreciate their potential impact, recognize the difficulties patients experience in

moving towards behavioral change, and provided "immediate applicability" for skills learned through the in-class and standardized patient exercises.
